# SHANKS'S LAWN MOWERS

THE ONLY ONES FITTED WITH PATENT AXLE SPRINGS.

**STANDARD GEAR MACHINE,**  
WITH PATENT AXLE SPRINGS.

**HAND MACHINES.**

Made in all Sizes, to cut from 6 in. to 24 in. wide.

**STANDARD CHAIN MACHINE,**  
WITH PATENT AXLE SPRINGS.

**TESTIMONIALS**

Lord's Cricket Ground, London, June 15, 1894.  
I have used your Lawn Mowers for over twenty years, and have no fault to find with them. I consider them the best in the market, and they are the only machines we use here. The addition of the springs to our 48-inch Mower is a great improvement, and the Machine works with great ease and smoothness. I consider you have made a good hit. Yours truly, (Signed), PERCY PEAROE, Ground Supt.

Surrey County Cricket Club, Kennington Oval, London, April 9, 1894.  
I have given our large Machine that you fitted with your Patent Springs a fair trial. I am very pleased indeed with the springs; they do away with all jar and shake on any ground, and prove to be all you claim for them.—Yours truly, (Signed), SAMUEL APTED.

**HORSE MACHINE,**  
WITH PATENT AXLE SPRINGS.

**TESTIMONIALS.**

Hurlingham Club, Fulham, June 13, 1895.  
I have used your Lawn Mowers for over twenty years, and find them the best. The addition of springs is a very great improvement. (Signed), WM. SUTHERLAND, Head Gardener.

Ranelagh Club, Barnes, S.W., October 13, 1895.  
On behalf of the Committee, I have pleasure in stating that your Mowing Machines, fitted with Patent Steel Springs, have been used for six months on our Golf Links and Polo Grounds, and have given the greatest satisfaction. The springs, in our opinion, are a great improvement in Lawn Mowers.—Yours faithfully, (Signed), HENRY E. RIDLEY, Assistant Secretary.

## HORSE, PONY, & DONKEY MOWERS { For Golf Courses, Cricket Grounds, Private Lawns, &c.

**"THE BRITANNIA,"**  
A Perfect Side-Wheel Mower.

**"THE CALEDONIA,"**  
Light Roller Machine,  
WITH PATENT AXLE SPRINGS.

**TESTIMONIALS.**  
(PER BEN REID AND CO., of ABERDEEN.)  
The "CALEDONIA" Lawn Mower made by Shanks, Arbroath, is one of the best I have ever tried. I got a 14-inch size, and it is undoubtedly the lightest and sweetest-working Mower in my collection.—(Signed) JOHN M. TROUP, Gardener to H.M. the Queen, Balmoral.  
58, Dawson Street, Dublin, Nov. 1, 1894.  
Referring to the Horse Machine supplied last season, Mr. J. Robertson, Land Steward to the Right Hon. Karl Fitzwilliam, writes us as follows:—I have great pleasure in stating that the Horse Lawn Mower has done its work exceedingly well. The Patent Springs fitted to the main axle are a great advantage, especially when the ground is uneven, as they prevent jolting and vibration of the machine.—Yours truly, (Signed), W. DRUMMOND AND SONS.

## NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, consequent on the large increase in the circulation, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

**CANNELL'S CABBAGES.**—Whilst nearly all the World's have bolted, gone to seed, and moily thrown on the waste heap, people loathe their hearts, pitifully remarking, "Can't be helped, it's the weather." What an unfortunate mistake! A complaint understood is half-cured. Those we supplied with Seed have an abundance of hearts. As an instance from the many congratulating us, Mr. W. SALMON, Shrubh's Hill Gardens, Sunningdale, Berks, writes:—"I have a splendid bed of your 'Defiance,' not one run to seed, have been cutting ever since April 10; it is a grand variety," All suffering, send for our Catalogues SWANLEY, KENT.

**THE BEST PEA FOR LATE SOWING** IS SHARPE'S QUEEN. Price 2s. per quart, post-free. Trade Price on application. CHARLES SHARPE AND CO., LIMITED, Sleaford.

**HUMEA ELEGANS.**—Young healthy Plants of this highly decorative plant for Conservatory or Flower Garden, the foliage giving a most powerful odour much admired by most persons. 18s. per dozen. B. S. WILLIAMS & SON, Victoria and Paradise Nurseries, Upper Holloway, London, N.

**ALPINE, ROCK, and HERBACEOUS PLANTS.** Unique Collection. Catalogue Illustrated. Cultural Notes, on application. 100 SAXIFRAGES and Dwarf PHLOX, 25s. per 100. STANFIELD BROTHERS, Southport.

**SUPERB ORCHIDS, CHEAP.**—Thousands to select from. Write for LIST, free. P. MOARTHUR, The London Nursery, 4, Maida Vale, London, W.

**HENRY RIDES, SALESMAN, Central Avenue, Covent Garden, W. C.** Highest Market Prices, Prompt cash.

## Sow Now.

**SUTTON'S PERFECTION CALCEOLARIA.**—By continually crossing the finest types of flower, we are able to ensure great diversity and richness of colour, and we continue to save seed from the choicest flowers only, produced on plants possessing the dwarf and vigorous habit for which our strain has an established reputation. Mixed colours, per packet, 3s. 6d. and 6s., post-free.

**SUTTON'S PERFECTION CALCEOLARIA.**—The Rev. Robt. Hole, North Tawton, says:—"My Calceolarias are surpassingly beautiful from your strain—short, hushy plants crowned with masses of large flowers of every imaginable hue. I have seen nothing to equal them, and this is the unanimous opinion of all who have seen them."

SUTTON'S SEEDS GENUINE ONLY DIRECT FROM SUTTON AND SONS, THE ROYAL SEEDSMEN, READING.

**CARNATION SEED.**—Sow now for next year's bloom. Choicest English saved seed, 1s. 6d. to 2s. 6d. per packet. Send for Carnation Catalogue to—JAS. DOUGLAS, Great Bookham, Surrey.

**DICKSON'S SUPERB CINERARIAS.**—A magnificent Strain, the flowers being symmetrical in form, of great size and substance, and showing most rich and varied shades of colour. Per packet, 1s. 6d., 2s. 6d., 3s. 6d., and 5s. each.—DICKSON'S, Royal Seed Warehouse, CHESTER.

**BEGONIAS** of the newest and most superb type, including many rare varieties, Double and Single, for Conservatory or Bedding. See B. R. DAVIS' Descriptive CATALOGUE, free. A handsome coloured plate of Six Double Varieties and a Treatise on Cultivation, free for 1s. B. R. DAVIS, Yeovil Nurseries, Yeovil, Somerset.

**KENT, THE GARDEN OF ENGLAND.**—GEORGE BUNYARD & Co., The Royal Nurseries, Maidstone, are the largest growers and the best cultivators of fruit trees. CATALOGUE, six stamps. 800 kinds, true to name.

PINES.—For Sale, a few dozen succession and rooted Seekers of Smooth Cayennes; clean.—Apply to GARDNER, Grimston, Tadcaster.

AN APPEAL.

MANY of the older generation of Housekeepers will remember Mrs. ELLA WARREN, the Editress for many years of 'The Ladies' Treasury,' and Authoress of a large number of practical works on Cookery and Domestic Economy. At an advanced age, and in too feeble a state of health to continue her work, this veteran authoress has fallen penniless, owing to circumstances entirely beyond her own control. This is a hard fate for one who has worked so much, during a long life, for the good of others. Some of her literary friends are endeavouring to raise a fund to comfort her remaining years, contributions to which, however small, will be thankfully received by— Miss ELLEN T. MASTERS, 4, Mount Avenue, Ealing, W.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

THE 57TH ANNIVERSARY FESTIVAL DINNER, in Aid of the Funds, will take place at the "Hotel Metropole," on SATURDAY May 30, 1896, when the Right Hon. the EARL of LATHOM, G.C.B., P.C., will preside. The Committee have the pleasure to announce the following further amounts, which have been promised or received, and added to the Chairman's List:—

Table listing names and amounts for the Gardeners' Royal Benevolent Institution. Includes names like Henry Tate, Spencer Morris, John Gabriel, etc., with amounts in pounds and shillings.

Table listing names and amounts for the Gardeners' Royal Benevolent Institution. Includes names like Walker H. Burns, W. Plant, Henry Cross, etc., with amounts in pounds and shillings.

NOTICE is HEREBY GIVEN, that the PARTNERSHIP lately subsisting between us the undersigned, SOLON DENSON and SIDNEY JAMES DENSON, carrying on business as Plant-Salemen, Palm Importers, and Nurserymen, at No. 22, Maida Vale, in the County of Middlesex, and Field Common, Walton-on-Thames, in the County of Surrey, under the style of "S. DENSON & CO.," has been DISSOLVED by MUTUAL CONSENT as from the 25th day of April, 1896. The Business at No. 22, Maida Vale, will in future be carried on by the said Solon Denson, who will pay all debts owing by the said late firm in respect of this Business.

The Business at Field Common, Walton-on-Thames, will in future be carried on by the said Sidney James Denson, who will pay all debts owing by the said late firm in respect of this business. (Signed) SOLON DENSON, S. J. DENSON.

# SHANKS'S LAWN MOWERS

THE ONLY ONES FITTED WITH PATENT AXLE SPRINGS.

STANDARD GEAR MACHINE,  
WITH PATENT AXLE SPRINGS.

HAND MACHINES.

Made in all Sizes, to cut from 6 in. to 24 in. wide.

STANDARD CHAIN MACHINE,  
WITH PATENT AXLE SPRINGS.

TESTIMONIALS.

Lord's Cricket Ground, London, June 15, 1894.  
I have used your Lawn Mowers for over twenty years, and have no fault to find with them. I consider them the best in the market, and they are the only machines we use here. The addition of the springs to our 48-inch Mower is a great improvement, and the Machine works with great ease and smoothness. I consider you have made a good bit. Yours truly, (Signed), PERCY PEARCE, Ground Supt.

Surrey County Cricket Club, Kennington Oval, London, April 3, 1894.

I have given our large Machine that you fitted with your Patent Springs a fair trial. I am very pleased indeed with the springs; they do away with all jar and shake on any ground, and prove to be all you claim for them.—Yours truly, (Signed), SAMUEL APTED.

HORSE MACHINE,  
WITH PATENT AXLE SPRINGS.

TESTIMONIALS.

Hurlingham Club, Fulham, June 13, 1895.  
I have used your Lawn Mowers for over twenty years, and find them the best. The addition of springs is a very great improvement. (Signed), WM. SUTHERLAND, Head Gardener.

Ranelagh Club, Barnes, S.W., October 13, 1895.  
On behalf of the Committee, I have pleasure in stating that your Mowing Machines, fitted with Patent Steel Springs, have been used for six months on our Golf Links and Polo Grounds, and have given the greatest satisfaction. The springs, in our opinion, are a great improvement in Lawn Mowers.—Yours faithfully, (Signed), HENRY E. RIDLEY, Assistant Secretary.

## HORSE, PONY, & DONKEY MOWERS { For Golf Courses, Cricket Grounds, Private Lawns, &c.

"THE BRITANNIA,"  
A Perfect Side-Wheel Mower.

"THE CALEDONIA,"  
Light Roller Machine,  
WITH PATENT AXLE SPRINGS.

TESTIMONIALS.

(PER BEN REID AND CO., of ABERDEEN.)

The "CALEDONIA" Lawn Mower made by Shanks, Arbroath, is one of the best I have ever tried. I got a 14-inch size, and it is undoubtedly the lightest and sweetest-working Mower in my collection.—(Signed) JOHN M. TROUP, Gardener to H.M. the Queen, Balmoral.

58, Dawson Street, Dublin, Nov. 1, 1891.  
Referring to the Horse Machine supplied last season, Mr. J. Robertson, Land Steward to the Right Hon. Earl Fitzwilliam, writes us as follows:—I have great pleasure in stating that the Horse Lawn Mower has done its work exceedingly well. The Patent Springs fitted to the main axle are a great advantage, especially when the ground is uneven, as they prevent jolting and vibration of the machine.—Yours truly, (Signed), W. DRUMMOND AND SONS.

HAND, HORSE, OR PONY ROLLERS, FOR GARDENS, PARKS, GOLF GREENS, &c.

## ORCHIDS — ORCHIDS.

Clean, healthy, well-grown plants at reasonable prices; many large specimens and rare varieties.

### CHOICE DENDROBES A SPECIALTY.

PLEASE WRITE FOR LIST.

**JAMES CYPHER,** EXOTIC NURSERIES, CHELTENHAM.

## CANNAS.

Strong plants in lots, of all the best varieties, now ready for sending out.

LIST FREE ON APPLICATION.

**J. R. PEARSON & SONS,**  
 Chilwell Nurseries, NOTTS.

## NEW ROSES FOR 1896.

### LAURENCE ALLEN, H.P.

The best light Hybrid Perpetual Rose introduced since Her Majesty was distributed. 7s 6d. each.

### BLADUD, H.P.

A very distinct and beautiful Hybrid Perpetual; silvery-white, with delicate blush centre. 7s 6d. each.

### COOLING'S SINGLE CRIMSON BEDDER

A welcome addition to Garden Roses. Quite distinct. Each 5s.

Strong Plants ready End of May.

**GEO. COOLING & SONS**  
 NURSERYMEN, BATH.

**CHEALS' celebrated DAHLIAS**

WORLD-WIDE RENOWN. STRIKING NOVELTIES

## FRUIT DRYING.

IN 1891, and again in the following year, some interesting demonstrations of fruit-drying by evaporation were given at the Royal Horticultural Gardens, which we fully described and commented on at the time. Since then the "American" evaporator has been in operation in various parts of this country, though only on a limited scale, but with results quite confirming its usefulness and practicability. But notwithstanding, it has not yet become naturalised in England; while on the other hand its popularity in America, Germany, and Austria has greatly extended. The most recent statistics respecting the production of evaporated fruit in the United States show that in California alone, according to a report by the chairman of the State Board of Horticulture to the State Board of Trade, the shipments in 1895 were as follows: Fresh fruits, 132,508,000 lb.; dried fruits (chiefly those dried by evaporation), 102,652,000 lb.; canned fruits, 62,590,000 lb. In comparison with these figures, to show the changes that have occurred, we will quote those for 1893 and 1871, namely, fresh fruits, 159,905,000 lb. (1893), as against 1,832,310 lb. (1871); dried fruits, 82,486,000 lb. (1893), in 1871 none; in 1875 (the first year in which any shipments of importance were made), 548,227 lb.; canned fruits, 58,681,400 lb. (1893) as against 182,090 lb. (1871). Or to put the matter in another way, the exports of Californian fruits in 1871, before the evaporator came into general use, realised only £10,240, while in 1895 their value increased to £3,334,152. We quote these figures from a speech made by Captain J. Addison Smith, a Californian fruit-evaporator, at the Society of Arts on the 29th ultimo, at a meeting when Mr. Edward W. Badger, F.R.H.S., of Birmingham, read a paper on "Fruit and Vegetable Drying," which he had prepared at the request of the Council. We have no means of testing Captain Addison Smith's figures, but he gave them on the authority of a State official, and assuming them to be reliable, it would certainly appear that our American cousins produce and find a market for an enormous quantity of fruit, and that since 1893 each class of fruit has changed its position, for the shipments of unmanipulated fruits have fallen off nearly 20 per cent., dried fruits have increased 40 per cent., while canned fruits have increased only 6 per cent.

Our object in printing these figures is to show English fruit-growers that American fruit-growers having fully tested the evaporator, are yearly extending its use, and that a very considerable quantity of the dried fruit produced by them finds its way into this country, where it is now regularly on sale at stores, grocers' shops, and elsewhere. Such being an undoubted fact, it seems to us that it behoves English fruit and vegetable growers to look at the matter in a business-like fashion; and we recommend them to make a thorough investi-

gation, and find out for themselves whether a process which is so universal and successful in the United States cannot be advantageously used here. If the answer should be in the affirmative, then fruit and vegetable evaporating should become one of our recognised industries, and be carried on with skill and economy, so as to produce the best results at the lowest possible cost.

We are inclined to think that prejudice and want of knowledge account for much of the apathy with which this subject has hitherto been treated. We have heard of cases where an evaporator has been purchased, tried for a time, and then put on one side as useless. But—and we have some positive knowledge of the capabilities and possibilities of the evaporator—is it quite certain that it is not the operator that is in fault? At the meeting of the Society of Arts, to which we have alluded, there was a display of dried fruits from many countries, including some Californian evaporated fruits, and another display of English produce; and no one could compare the two without being convinced that the English was, in all respects, the better one. A Californian expert present at the meeting expressed the opinion that he had never seen better evaporated products than those exhibited on that occasion by Mr. Trotter of Ledbury, and that such fruit would undoubtedly fetch the highest price obtainable in America. We think we are right in saying that Mr. Trotter did not commence evaporating until after the 1891 demonstration at Chiswick, and now he is probably the most expert operator in the United Kingdom. Those who wish to know what his experiences and opinions are cannot do better than consult Mr. Badger's paper which (with the description that followed the reading of it) is printed in full in the *Journal of the Society of Arts* issued on the 1st inst. Mr. Badger's paper describes the construction of the evaporator and how it is manipulated, and gives a good deal of information about the kind of work it can do. It also contains a number of practical questions which he asked Mr. Trotter, and that gentleman's replies. We commend a careful perusal of them. It is to be hoped that the day is not far off when the evaporator will be manufactured in this country, for it has been intimated that no patent rights, so far as England is concerned, now stand in the way of any enterprising firm who may be disposed to supply his countrymen with this useful apparatus.

### THE "VIOLA."

The "Viola" may be deemed an unpretentious flower, when compared with the Carnation, the Lily, or the Rose; yet it has great capabilities for garden-decoration. For this special reason, it has of late years achieved a marvellous popularity, much of which it undoubtedly owes to the writings of the late Mr. W. Dean, of Birmingham, who may be said without exaggeration to have popularised this flower; Mr. Wm. Cuthbertson, of Rothesay, chief partner in the eminent firm of Dobbie & Co., who has raised some of the finest of existing varieties; Mr. McLeod, of Chingford, and Mr. William Robinson, who conferred upon Violas (Mr. Dean and others asserting that it was only partially expressive), the name of "Tuted Pansies." Doubtless, there are varieties that may be thus described; but at the same time there are many to whose nature and habit this title does not apply. Violas

were Mr. W. Dean's favourite study—his interest in them was not that of an ordinary cultivator; he regarded them with something of that tender interest wherewith a parent watches over his children.

I have always been accustomed to regard the Viola as essentially a Scottish flower; for there can be no question that it succeeds best in Scotland. But it is now largely and successfully cultivated in England; a fact which has of late years been emphasized by the formation of a London Viola and Pansy Association. I am gratified to learn from Dr. Stuart, of Chirnside in Berwickshire, a great raiser of Violas, that at the Crystal Palace show of 1895, his Florizel, as exhibited by Mr. Pye, of Catterall, Garstang, was awarded both the Gold Medal and the President's Prize—an enviable distinction. Dr. Stuart, who has given us an *Aquilegia* of remarkable merit, A. Stnarti (accurately described by the Messrs. Veitch, by whom it is largely cultivated as "a hybrid between A. Glandulosa and A. Witmanni")—was the raiser of the famous race of miniature rayless Violas, of which the first and the finest was *Violetta*, an inestimable gem of purest ray serene, or rather, as I have indicated, one destitute of rays. One of its most charming attributes is its fragrance, which rivals that of *Viola odorata*; it is also very precious for its purity and productiveness. Another of Dr. Stuart's creations of equal merit and fascination is the cream-coloured *Sylvia*, whose flowers are produced in the greatest profusion.

Among other highly distinguished raisers are Mr. James Grieve, who may be regarded as a great Viola specialist; Mr. William Cuthbertson, to whom we are indebted for many varieties of the loftiest distinction, among which are *Iona* and the *Prince of Orange*; Mr. Baxter, of Daldowie in Perthshire, whose name is inseparably associated with the *White Duchess* and *Duchess of Fife*, which though notable illustrations of the law of variation, derive their form and their fragrance from the venerable *Ardwell Gem*.

Besides those already enumerated incidentally, the following are the Violas I have cultivated most, and can chiefly recommend, viz., *Blush Queen*, *Countess of Wharnccliffe*, *Countess of Kintore*, *Crimson King*, *Duchess of Sutherland*, *Edina*, *H. M. Stanley*, *Marginata*, *Blue Gown*, and *True Blue* (the two finest of this special colour); *Peter Barr*, described by Mr. William Cuthbertson as "the most distinct Viola ever introduced;" *Queen of Scots*, expressive of beauty and sad vicissitudes; *Ravenswood*, which reminds us of Sir Walter Scott and his grandest tragic romance, the *Bride of Lammermoor*—a most distinctive variety, of dark velvety hue. There are many others, of even more recent introduction, some of which I may hereafter be in a better position to characterise, after I have adequately tested in my garden their various capabilities. Of the varieties I have recorded, my supreme favourites are *Violetta* and *Countess of Wharnccliffe*, valuable alike for their beauty, their graceful habit, their delightful perfume, and extreme floriferousness; *Iona*, and *Prince of Orange*, both coming from Rothesay, and highly outdowed; *Florizel*, *Sylvia*, *Countess of Kintore*, *Ravenswood*, and *Duchess of Fife*. I would very cheerfully, if I had no other alternative, confine myself to these. But at the same time I am always glad to welcome and assiduously cultivate the latest introductions, and especially those which have the merit of distinctiveness.

I have learned from experience—that most reliable of all teachers, the only one that may

be regarded as perfectly infallible—that *Violas* should, especially in their primary stages of development, be assigned comparatively shaded borders, where, in a sultry, and therefore, for them, exacting season, they are shrouded from the rays of the sun. Under other conditions than those I have just spoken of as essential to their growth, such varieties as the distinct-coloured *Duchess of Fife*, and the fragrant, satiny-white *Countess of Wharnccliffe*, are almost certain to be annihilated. If for not less than several weeks after being planted in moderately fertile soil, they are remorselessly disbudded, they will grow much more vigorously, and bloom more luxuriantly; and this salutary process, however self-sacrificing on the part of the cultivator, who looks to the future rather than to the present, will ensure for them also considerably longer lives. It is on the same principle that young fruit trees are deprived by such pomologists as Mr. Rivers and Mr. Bunyard of their fruiting-spurs, that they may tower through such sacrifice into greater height and nobler strength. Youth in any form, if vigorously healthy, has invariably a tendency to attempt too much, especially in the dangerous direction of premature production; and whatever tends towards exuberance must therefore be counteracted, otherwise our finest fruit trees will degenerate; our fairest *Roses* for exhibition will become "flowers of the forest;" our noblest garden treasures the wild woodland parents from which they were derived. Of superfluous, wasteful, weakening growth, the result is degeneration; this is the law of physical and of vegetative life. *David R. Williamson.*

### NEW OR NOTEWORTHY PLANTS.

#### SOBRALIA BRANDTIIÆ, Krzl.\*

The plant resembles at first sight a medium-sized *Sobralia macrantha*. The sheaths of the leaves do not show the black bristles like the other species of this section, but only very minute blackish spots. The bracts are very small, and cover only the base of the flower. The sepals and the somewhat broader petals are linear, or linear-oblong, pale rose-coloured outside, and intensely rose-purplish inside. The lip is rather larger than the petals, convolute over the column, and obscurely four-lobed. The two side-lobes are reduced to blunt angles; the middle one is very broad, and on its anterior part divided into two diverging rather acute lobes. The disc of the lip is orange-coloured; the margin is wavy like in many other *Sobralias*. The emergences on the disc are reduced to five small scarcely elevated lines; the column is slender as usually, but it has on both sides of the anther-bed a long recurved horn, longer and more curved than in any other species I know. I have pointed out all the peculiarities of this species interesting in first line to the botanists, the number of similar species being a rather large one to-day; and I have to add some remarks to the subdivisions made by Dr. Lindley in the *Folia Orchidaceæ*, January 21,

\* *Sobralia Brandtiiæ*, Krzl.—Caulibus ad 1 m. altis, foliis distichis arcto vaginantibus, vaginis levibus, laminis lanceolatis acuminatissimis ad 20 cm. longis, medio 4-5 cm. latis, satis firmis quinque-nerviis; floribus heterochromis, bracteis brevibus foris basin tantum amplexantibus, 3 cm. longis (expansis), 6 mm. latis; sepalis linearibus, petalis duplo latioribus, linear-oblongis 6-7 cm. longis, sepalis 1 cm., petalis 1.8-2 cm. latis; labello ad 9 cm. longo e basi anguste emittente antice valde dilatato utrinque obtusangulo antice in lobulis 2 acutiusculis paulum divergentibus extenso, venis 5 in disco medio fere usque vix prominulis mox evanescentibus, margine labello inclutato-crispo; gynostemio gracili apice utrinque cornu in aximo reflexo subtus excavato instructo, antheram multo superante, maximo ad huc in genere!—Flores purpureæ, labellum intensius coloratum discus labelli aurantiacus.

Habitat? Introductus Fred. Sander, v. cl. Verulamensis. Domina Idæ Brandt Toricensis de cultura. Orchidacearum hinc temporibus optime merito grato animo dicavit autor.

1854. "The division, § C.:—Flowers in a cone-like head, or naked, is divided in series—1, lip with crested veins;" and 2, "lip with naked veins. Both divisions are subdivided thus "leaf-sheaths or bracts, hispid, with black hairs and leaf-sheaths, or bracts naked. This scheme was regarded as the only legitimate one up to our days, and indeed it was sufficient for all the species we received from Southern America since the days of Lindley. The new species I publish to-day destroys not only the two divisions, but also the two subdivisions. The sheaths of the leaves are not provided with black hairs properly speaking, but with black points, and we must regard from the morphological point of view these black points as rudiments of hairs; secondly, the lip has five elevated lines, too deep to be regarded as simple lines, too

in front is Leeds Castle and its beautiful park, which greatly add to the scenic features of Elsfield. Once in summer time Mr. Laurence's grounds and glass-houses are thrown open to the inspection of the public, which is during the flower show, of which he is the president, the show being held in front of Elsfield House.

One of the illustrations (fig. 97) represents a tree-shaded walk in the gardens, with various species of Ferns planted in a bed and in the border to the right-hand of the picture, where, doubtless owing to the shade and drip, but few other plants would thrive. The other view (fig. 98, p. 611), shows a sunlit bed, or extremity of a shrubbery, filled with herbaceous perennial plants, evidently exactly suited to the soil and surrounding conditions. A conservatory joins the house,

FIG. 97.—A SHADY WALK WITH FERNS, IN THE GARDENS OF W. LAURENCE, ESQ., ELSFIELD HOUSE, MAIDSTONE.

small to be called crested veins. For the moment the new plant may be placed between *Sobralia violacea* and *S. macrantha*; afterwards, a new subdivision of this tribe of *Sobralias* will be unavoidable.

It is undoubtedly a charming plant, not so big as *Sobralia macrantha*, and, as far as I can judge from my material, freely flowering for several weeks. The flowers rise from the cone-like head of the stalk one by one. *F. Kränlin*.

#### ELSFIELD HOUSE, MAIDSTONE.

AMONG the many pretty gardens in Mid-Kent is the subject of this note, belonging to W. Laurence, Esq., J.P., and situated about 4 miles from the county town, on the high road to Ashford. The mansion stands in a fine park, on one side of which lies the village of Hollingbourne, on the other the village of Leeds, dating back hundreds of years, and

which contains the usual kinds of flowering and foliage-plants; and in the season a great display is made therein with *Chrysanthemums*, of which Mr. Robinson, the gardener, is an excellent cultivator and successful exhibitor, a fact well illustrated by his having taken nearly 500 prizes during the last ten years, many of them at the Aquarium and Crystal Palace shows. The other glass structures consist of four vineries, three Peach-houses of large dimensions, a stove, together with houses and pits for the cultivation of Melons, Tomatos, Cucumbers, &c.

The kitchen garden is a very good one, although not of large extent, and the soil a light sandy loam of considerable depth, needing, as a matter of course, copious applications of water to wall trees and growing crops. Provision is made for this by means of a large tank placed in the middle of the garden, into which water is forced from the river that runs through the park.

## ORCHID NOTES AND GLEANINGS.

### ORCHIDS AT CASTLETON HOUSE, CLIFTON.

CLOSE to the Clifton Down Station, and seemingly in a very unlikely quarter to find several houses of well-grown Orchids, and many of them rare plants, the eye of the passer is attracted by a fine show of Orchids in the window of a dwelling-house in an ordinary row of houses, and here are the quarters of our old correspondent A. H. Milton, Esq., who by the number of specimens he has sent, and the questions he has asked, has evinced one of the best evidences that he intended to succeed in the culture of his plants. Inspection amply proves that his endeavours were not futile. The pretty group in the window alluded to was made up of a fine specimen of *Cattleya Schroderæ*, with ten flowers; a richly-coloured *G. Trianaei*, with three blooms; a splendid specimen of *Dendrobium thyrsiflorum*, with several spikes; some good examples of *Odontoglossum crispum* and *O. maculatum*, and some brilliant scarlet *Sophrontis*, all artistically arranged by the ladies of the house, and forming a display pleasant to behold, both from the inside of the house and from the road.

Passing to the Orchid-houses, which may be said to cover the greater part of an ordinary back garden, and which is built in on every side, we found a neat block filled with a general collection, all in fine condition, and affording yet another instance of the adaptability of Orchids to circumstances; for here, where neither *Fuchsias*, *Pelargoniums*, nor any other of the common plants would thrive so well, these exotics were growing and flowering satisfactorily, under the care of the members of the family, only with the assistance of Mr. Murrell, a gardener who attends two or three days a week.

In the house in which the rarer plants are kept were some sixty plants of *Cattleya aurea*, and of small size a good number of seedlings of *C. aurea* crossed with various species; a fine plant of *C. × Hardyana*, with two leading growths; some good examples of *Cattleya Trianaei alba* and *C. Mossiæ Wagneri*; seven splendid plants of *Cattleya Rex*, and two very strong *C. × O'Brieniana*, *C. Skinneri alba* in several examples, *C. Schroderæ alba*, and six plants of *Dendrobium Wardianum album*, together with other rare things. In one intermediate-house was a very good show of *Cattleya Schroderæ*, *C. intermedia*, *C. Walkeriana*, *Oncidium sarcodes*, and other *Oncidiums*; *Miltonia Roezlii*, and *M. R. alba*; *Cymbidium Lowianum*, and the different species of showy *Dendrobiums*, among which the *D. Phalænopsis Schroderianum* were remarkable for their vigour.

In the *Cypripedium*-house some rarities were noted, such as *C. × Chas. Richman*, some of which were in flower; especially noteworthy was a charming variety of *C. exul*, with almost wholly yellow and pure white flowers, the chocolate-coloured spots being almost suppressed. Here, too, were the brightly-coloured *Epidendrum × O'Brienianum*, and a few other *Epidendrums* and *Oncidiums* in flower. In the cool-houses there were in flower several plants of *Odontoglossum crispum*, one a very handsome blotched form; a magnificent variety of *O. Hallii xanthoglossum*, *O. Andersonianum*, *O. cordatum*, *O. maculatum*, *O. Pescatorei*, and other species.

### THE TREATMENT OF BRAZILIAN ORCHIDS.

IN reply to a question asked by a correspondent, we gladly publish the following remarks on the subject of the treatment of Brazilian Orchids by Mr. Jas. Douglas. The questions to which replies were asked were—1. What is the lowest temperature they will grow in? 2. By what means are they made to attach themselves anew to tree branches?—should a layer of mould be put on the branch, and the Orchid roots tied on until they get a hold? The Orchids come from the neighbourhood of Pernambuco.

"First, as to temperature. I will assume they are *Cattleyas* and *Lelias*, for which Southern Brazil is the home, although none is found in the immediate neighbourhood of Pernambuco, and doubtless the plants were sent north from the Bahia district, or

even from the district near Rio de Janeiro. The *Lælias* and *Cattleyas* found nearest to Pernambuco are *L. grandis*, *L. xanthina*, *C. Aclandiae*, *C. Schilleriana*, *C. guttata*, and these are met with as far south as Serra Grande, all of which must be classed with these genera, found more than usually difficult to cultivate; and they certainly ought not to have a lower temperature, even in winter, than 55°. There is, however, an enormous extent of country between Rio grande, where *C. Loddigesii* is found, and Bahia the more northern point, and the habitats of *L. grandis* and *L. xanthina*; but this and the diversity of climate notwithstanding, all the *Cattleyas* and *Lælias* from this region may well be grown in one and the same house, affording the plants a minimum temperature of 55° between October and April, gradually increasing the night temperature to 65° by midsummer, and again lowering it after the end of the month of August, that is, when cold nights in this country set in. The day temperature is dull or cloudy weather may generally be about 5° higher, and in sunshine as much as 15° to 20° higher.

As regards the second question, the plants, as is well known, attach themselves to tree branches or on to rocks, or to whatever supports the dust-like seeds are carried by the wind; indeed, the plants are sometimes found in very exposed places; but they are kept in health by the humidity of the climate, which is principally due to the moisture coming inland from the South Atlantic Ocean on the wings of the trade winds. In this matter it is no use trying to imitate nature, and *Cattleyas* and *Lælias* cannot be kept in good health in our hothouses when attached to branches of trees, unless very great attention be afforded. All the tall and large-growing species should be planted in pots in a mixture of Orchid-peat and sphagnum-moss. Taking the Brazilian species requiring this kind of treatment, they are *C. Loddigesii*, *C. purpurata*, *C. guttata*, *C. labiata*, *C. I. Warneri*, *C. intermedia*, *C. crispata*, *L. lobata*, *L. xanthina*, *L. grandis*, *C. Schilleriana*, *L. Perrini*, *L. elegans*. Of the species requiring, or, at least, that would succeed best in baskets of teak-wood or in pans suspended from the roof of the house, in such a position that the tips of the leaves would be within a few inches of the glass, the following may be named:—*L. pumila*, *L. Dormaniana*, *L. cinnabarina*, *L. flava*, *C. Walkeriana*, *L. harpophylla*, *C. Aclandiae*, and *L. Jongheana*. In pot culture, fill the pots half full of crocks, so that the drainage may be thorough, and pot the plants in a mixture of good fibrous Orchid-peat and sphagnum intermingled with crocks. The same sort of materials are used for the smaller *Cattleyas* and *Lælias* that are put into teak-baskets or pans. *J. D.*"

## TREES AND SHRUBS.

### PRUNUS PADUS.

The common Bird-Cherry is a valuable flowering tree, especially adapted for planting in woods, intermingled with other trees. For the garden proper, however, there are other Cherries and Plums of greater beauty, and, where space is at all limited, these might well have the preference. There is now in blossom at Kew a double-flowered form whose superiority to the type is so marked that it is well deserving of a place in any garden. The racemes are 6 to 8 inches long, and the individual flowers close on three-quarters of an inch across. Not only are they larger than those of the ordinary Bird-Cherry, but also they last longer in beauty. This variety is apparently new, and is of continental origin.

*Prunus Padus* is widely spread over the northern parts of the Old World, being found not only in North and Central Europe, but in Manchuria and Japan. The Manchurian form of this species has recently flowered at Kew. It is remarkable for its earliness to blossom, its flowers being long past before those of its European fellows have expanded. It has the additional merit of producing larger flowers and racemes. It came into cultivation by way of the St. Petersburg Botanic Garden, and is figured in *Garden and Forest*,

1888, p. 295. [The Himalayan form, *P. cornuta*, is remarkable for its red leaf-stalks, and for the circumstance that its fruits are horn-shaped, as in the so-called Bladder Plums. Ed.]

### PRUNUS JACQUEMONTI.

This charming dwarf bush is flowering this season with exceptional freedom. It is a native of the North-western Himalaya, Thibet, and Afghanistan, where it is found at altitudes ranging from 6000 to 12,000 feet. It is one of the numerous plants which first became known to European cultivators through Dr. Aitchison, who sent to Kew, in 1879, seed of it, which he had collected in the Kurruum valley. It is described as attaining a height of 6 to 10 feet when fully grown, but the largest bushes at Kew are about 4 feet high. The leaves are from 1 to 2 inches long, and ovate-lanceolate; the flowers three-quarters of an inch in diameter, and of a bright rosy-pink, are produced thickly on the thin, wiry shoots made last year. It is a very desirable shrub, and is especially well adapted for occupying the front of a shrubbery, its branches feathering to the ground.

### PRUNUS HUMILIS.

As this is closely allied to the preceding species, and is often mistaken for it, it may be worth while to here point out the distinguishing characters. It is, in the first place, a native of China, a country which *P. Jacquemonti* does not reach. The flowers of both are about the same in size and colour, but *P. humilis* blooms a little later in the season than the Afghan species. The characters on which botanists most rely are the comparative length of the tube and lobes of the calyx, and the differences in the stipules. With regard to the calyx of *P. humilis*, the lobes are as long as the tube, and are nearly erect, but in *P. Jacquemonti* they are not half the length of the calyx-tube and are reflexed. The stipules of *P. humilis* are glandular-ciliate; those of its ally lacinate. *P. humilis* has been known to science since 1733, in which year an account of it was given to the Academy of Sciences in Paris by a French missionary named Parnin.

### CRATEGUS MOLLIS.

The earliest of all the American Thorns to burst into flower is *Crategus mollis*, and just now it is at its best, some of the trees at Kew being masses of blossom from the top to the bottom. It is curious that this tree, although by no means uncommon in gardens and nurseries, obtains no mention in the standard works of reference. The reason is, that until recently (probably until the publication of Professor Sargent's *Silva of North America*), it has been confused with *C. coccinea*. Both are natives of North America, and are closely related, but *C. mollis* is the superior tree. It reaches occasionally a height of 30 feet, and if allowed sufficient space, well furnished down to the ground. Every twig bears its flat corymb of flowers, measuring 4 inches or more across, a single flower being as much as 1½ inches in diameter, pure white, but with a circular patch of red in the centre. The leaves are 4 to 5 inches across, and soft to the touch, being always covered with a fine pubescence. *C. coccinea*, on the other hand, has perfectly glabrous, smaller leaves; its flowers, too, are smaller, and appear a week or ten days later than those of *C. mollis*. *W. J. B.*

## MARKET CUCUMBERS.

In one of the gigantic market establishments on the north side of London, may be seen some 120 houses, each 150 feet long, devoted exclusively to Cucumber production. This is, indeed, Cucumber-growing under glass by the acre. No wonder that the product annually is enormous, the fruits numbering hundreds of thousands. The entire range is planted with but one variety, that now famous one, known as Rochford's. The fruits are spiny, a feature much appreciated in the market. They have short necks, are of a dark green colour, and average 15 inches in length. Numerous hands seem to be perpetually employed

during the season in cutting and packing the fruits. The sale is governed by the dozen. On the door-post is marked the product of each house daily, and thus an exact record is kept of the numbers of fruits produced. The plants are all grown on the ground level, and where houses run side by side by scores, there is rarely any dividing wall. The intervening gutter is broad enough to admit of all water being carried away, and have a wooden stop somewhat raised running throughout the centre of each gutter, with a continuous ventilator 6 inches wide, down which air passes. The root-run is limited to areas about 20 inches wide, and from 6 to 7 inches deep. As wood-lice once gave much trouble, circular wire troughs about 12 inches across, and having in the centre a space for the stem 6 inches over, are placed at suitable intervals, and the plants put out into the soil in these central spaces. The soil is brought up to the rims of the troughs, and these are half-filled with water. Wood-lice never cross this styx and live, as they are inevitably drowned. The Cucumber-soil is in the proportion of about three-fourths turfy loam and one of decayed manure, and liberal feedings with guano or other artificial manure, or else with mulchings of animal manure, are furnished during a long-bearing season.

## KEW NOTES.

*AMHERSTIA NOBILIS*.—A large plant of this grand stove shrub has this year produced about fifty five racemes of flowers in one of the stoves (No. 1) at Kew. It is still in flower.

### BOUGAINVILLEA GLABRA SANDERIANA.

A large specimen trained against the roof glass in the porch of the Water Lily house at Kew is now a sheet of flowers (bracts). *B. spectabilis* is also in flower close by.

### ANTHURUM CHAMBERLAINI.

This rare and desirable species has, for the first time, matured a good crop of seeds at Kew.

## SUMMER BEDDING.

ALTHOUGH this form of summer flower-gardening has had during the past years to encounter much severe and wholesome criticism, still it survives, and is apparently as popular as ever, though in some respects changed in character, both in style and in material. It is hardly probable that a garden feature which has obtained so strong a hold on public estimation will be very quickly displaced. It has been with us fully half a century, for its commencement practically dates from the "forties," and amongst its earliest heroes were the once famous Tom Thumb Pelargonium, *Calceolaria amplicaulis*, blue and scarlet *Salvias*, *Heliotrope*, *Verbenas*, *Petunias*, *Fuchsias*, and various other plants. How much in some respects things have changed, and how much in some other respects has there been reversion to old material! To-day *Fuchsias* are very widely employed, though not quite in the crowded fashion they were fifty years since. *Heliotropes* are again in much favour, though of richer-coloured and better-habited forms. *Verbenas* have again come into vogue, though chiefly as mixed seedlings; and even blue *Salvias* and scarlet-flowered *Lobelia cardinalis* frequently overtop a base of some dwarf plants of neutral tint. In actual change of material, no doubt *Begonias* have produced the greatest change. The *Begonia* has leapt somewhat suddenly into the position of being the most popular bedding plant of the day. No doubt it is a well-merited position, because it gives us exceeding beauty—rich as well as refined soft tints in great variety, yet allied to much elegance, so long as the single-flowered forms are regarded.

As much also may be said of many of the small and wonderfully free doubles, of which we have so many, but which give their most beautiful effects only when seen in quantity. The big bunchy doubles are happily useless for outdoor bedding. But a very excellent feature of *Begonia* bedding now at least is that the

plants are put out thinly, not to produce a brilliant mass of colour, but to enable the special peculiarities of each plant to be seen. Then with a carpet of some dwarf-growing or creeping plant which covers the soil, the Begonias standing out boldly and individually, we have a feature in summer bedding that seems to be not merely beyond criticism, but is found to be generally attractive. But this feature in bedding is not confined to Begonias; we find that Fuchsias, now so happily resuscitated from a long period of comparative neglect, are similarly treated, and very beautiful they look when good plants and well-flowered. We find, too, that dark-flowered half-standard Heliotropes on a base of pink-flowered Ivy-leaf Pelargoniums, form another attractive mixture, neither being allowed to dominate; and in the same way silver and golden-leaved Pelargoniums harmonise very effectively with blue or purple Violas. These latter plants have been gradually growing into favour as bedders, and though sometimes harsh or gaudy if found in masses, are very charming indeed

private gardens find occasion to copy; and it has for its special furnishing a large selection of plants that could hardly be employed in gardens with any good effect in any other way. The primary elements are found in *Alternantheras*, succulents, and mossy plants, such as *Herniaria glabra*, *Sedums*, &c. These are plants that are singularly amenable to design-working, and to-day still we see them largely employed, the beds, when well filled, proving to be as attractive as ever, and seeming likely to long continue so. Nothing could be more unfortunate in what may be termed the decorative art in gardening than that it should all run in one groove, or be all of one model. We cannot well have much that is diverse in our fruit or vegetable gardens, or even in our plant or fruit-houses. There from year to year things have to be grown in much the same fashion. It is in the pleasure or flower-garden so termed that we may well look for variation. It may be that the Italian style, with its prim Box edgings, and coloured brick or gravel spaces, once so much in evidence at South Kensington,

did. It is in this respect very largely that hardy plants too have again become so popular. They have been enormously added to, and in that way have furnished attractive material that could not be denied, and we have perhaps learned to understand them, how to group them, how to cultivate and appreciate them. Thus it is that in every way summer bedding as a great gardening feature has been the gainer. *A. D.*

## FOREIGN CORRESPONDENCE.

*La Mortola*.—The fault of *Juniperus drupacea* in the early loss of the lower branches noticed by your correspondent in your issue of 25th ult., does not apply here, provided sufficient space be given. I have a male plant at least twenty-five years old, clothed to the ground, and beautiful in form and growth; it is 21 feet high, the greatest diameter is 14 feet, and the girth of the stem at its base is 40 inches; unfortunately, my garden does not possess a specimen of the other sex, so I have never seen the fruit. When on Mount Hermon in 1839, I searched in vain for this Juniper, though I believe it is to be found there. *Agave ferox*, a very splendid specimen, is about to flower here. *Pittosporum eriocarpum* in *Bot. Mag.*, pl. 7473, is now in full flower; this is a plant that should be tried in the open air in the south of England, its growth is most vigorous, and the scent of the blossoms is agreeable, less so perhaps than *P. multiflora*, which is the most fragrant of the genus.

The drought on the Riviera is becoming most serious, and threatens disastrous consequences, unless some timely showers fall between now and the middle of June, when the customary summer heat sets in with severity, unbroken as it usually is by any thunderstorms. The total rainfall in this garden since December 24, is only 1.14 inch; the smaller springs have already run dry. Olive trees appear to be too deficient in strength to produce their blossoms, and the Lemon trees present a shrivelled appearance where not irrigated, and altogether I do not recollect a more gloomy outlook for the peasants who are dependent on their crops. *T. Hanbury, La Mortola, Ventimiglia.*

## FLORISTS' FLOWERS.

### NEW VARIETIES OF GOLD-LACED POLYANTHUS.

DR. STUART, of Chermiside, N.B., is mindful of the gold-laced *Polyanthus*, notwithstanding his devotion to the rayless-flowered and miniature section of *Violas*. He has just sent me two bunches of his two new varieties—*Border Maid* and *Cooper O'Fogo*. The former of these is a black-ground flower in the way of *George IV.*, large, stout, and handsome, and evidently a vigorous grower; the lacing, perhaps, a little paler than the gold in the centre. The latter is of a dark-reddish ground, the centre bright gold, but the lacing is too broad to make it a refined variety; still, it may be the progenitor of something better. The gold-laced *Polyanthus* has been seen in much better condition during this spring than for a few years past, and it is pleasing to note there is a marked revival of this pet of the florists of the old school. At Didsbury, Mr. William Brockbank has in bloom some fine named seedlings of his own raising, and it is reported that the gold-laced varieties were finer at the Northern Primula Show than they have been for a few years past. *R. D.*

## COLONIAL NOTES.

### ROYAL GARDENS, TRINIDAD.

THE annual report of the Royal Botanic Gardens, Trinidad, for 1895, has lately been issued by Mr. J. H. Hart, the Superintendent. It contains the usual account of work done, plants cultivated, received and exchanged, and notes on experiments made with Sugar-cane and its enemies. It is pleasing to learn

FIG. 98.—A HERBACEOUS BORDER, IN THE GARDENS AT ELSFIELD HOUSE.

(SEE P. 609.)

when employed in mixtures. Another reversion of ancient date is found in the combination or mixed beds, in which not two, but perhaps twenty, diverse plants find representation. It is not possible to enumerate these, but whilst needing some judgment in planting, so that none shall dominate, all are distinctly pleasing when there is good balance in colour and in habit. The undoubted tendency of modern taste in bedding has been towards the elimination of mere masses of gaudy colours, big clumps of scarlet, yellow, blue, &c., and to replace them by combinations, that in no case override other beds by their gaudiness, as big masses of scarlet *Pelargoniums* where seen still do. In many cases beds are either far too large or too flat. It is in these especially that the introduction of dwarf or dot-plants, such as *Grevilleas*, *Dracenas*, *Abutilons*, &c., prove to be so valuable. The now almost old forms of carpet-bedding still remain with us. The late Mr. Rogers of Battersea, and Mr. Wildsmith of Heckfield, were of the earliest apostles of this form of bedding; and, in spite of severe, and no doubt much correct denunciation, it still survives. That is due, perhaps, to two causes. It is a style that is still very popular with the masses who frequent public parks and gardens, from whence, too, so many

is, to our more natural tastes, an abomination, and yet it is hard to complain if but one or two examples be still here and there found. Neither can we for a moment object if here and there are still to be found some striking illustrations of the Dutch style of decorative gardening, once so popular and so adapted to suit the tastes, which prevailed 100 years ago. Not now for a moment would any one plant a garden and severely trim it as this style requires, but being with us we may well be grateful that such living examples exist as they make us familiar with the garden tastes of our progenitors as well as of the old Dutch gardeners. It is for these reasons that we may well be glad. Carpet-beds, and, indeed, somewhere examples of all the bedding tastes of the last half-century are found. It is in so much variation that gardening finds its charm. It is a vocation that is after all, perhaps, less influenced by fashion than many other things which enter into our pleasures. Flower gardening has varied more because of the varied forms of plants introduced into it from time to time than from any other cause, and if now we do find a good deal of reversion to ancient kinds of bedding plants, it is because we have learned how to utilise them more gracefully than our predecessors

that the circulation of the *Bulletin* is steadily increasing, thus proving its practical utility and interest to cultivators.

#### AGRI-HORTICULTURAL SOCIETY OF MADRAS.

The *Proceedings* of this Society from October to December, 1895, are now to hand, and include in addition to the usual reports on the work done during the quarter, brief notes on *Araujia albens*, *Albizzia molucana* as a Coffee-shade in Zanzibar, Rice for unirrigated lands, Palm-beetle, and similar subjects.

## THE WEEK'S WORK.

### FRUITS UNDER GLASS.

By W. POPE, *Gardener, Highclere Castle, Newbury.*

**THE EARLY VINERY.**—Where Grapes are now ripe, the air of the vinery should be kept comparatively dry and cool, sufficient artificial heat being employed to prevent the temperature falling below 60°, and always with air admitted. The inside border, if found on examination to be deficient of moisture, should be afforded water somewhat copiously, followed by a thick mulch of spent Mushroom-bed dung, or similar material, to check evaporation, and keep the soil in a moderately moist state till the crop of fruit is consumed. The cultivator should bear in mind that Vines on which a crop of ripe fruit is hanging in June and July will require more moisture at the root than would be necessary or desirable during the autumn months. The application of water should be carried out in the early part of the morning. A moderate degree of extension of the lateral shoot may be permitted at this season, so that root-growth may still be maintained, and the premature ripening of the foliage prevented. In later vineries, where the berries are rapidly swelling, the required degree of warmth should be maintained with but a small use of artificial heat, and with this intent the vinery should be closed early in the afternoon, but admitting air at the top towards the evening in moderate amount by the upper ventilators, which should be afforded during the night as soon as the colouring of the fruit commences. At this date a good mulch of fresh cow-manure may be applied to the outside Vine-border, which will be of great benefit in dry soils and warm localities, as will also copious applications of water. If the drainage of a border is in proper order, Vines in full bearing require large quantities of water to keep them in health, and this is seldom done in dry summers.

**YOUNG VINES.**—Vines which were planted a short time ago and are growing with freedom, should also have proper attention paid them in respect to watering, &c., while as yet the roots can have taken no great hold of the soil. If the Vines were planted in the inside borders, and near to the hot-water pipes, a mulch of half-rotten manure will be of much benefit. If Vines are planted temporarily at intervals, with the intention of taking a crop from them next year, all the laterals should be stopped at the second leaf, and all growths forming subsequently at one leaf, the leader not being allowed to make more than 4 or 10 feet of growth before having the point nipped off.

**EARLY POT FIGS.**—Trees with ripening fruit must have a reduced quantity of water at the root, sufficient being, however, afforded to keep the leaves healthy; syringing must be discontinued, and a small quantity of ventilation afforded constantly at the top of the house, for a Fig to be well-flavoured must be ripened in dry, warm, buoyant air. As soon as the first crop is gathered, the trees should be encouraged to make a second growth by copious applications of liquid-manure, and a daily syringing; and when the second crop of fruit is forming, thin freely the fruits betimes, a moderate crop of well-flavoured fruit being preferred to a larger crop of inferior fruits. Trees which are planted out should have their shoots stopped at about the sixth leaf, and weak or superfluous ones removed, so as to admit light and air to the fruit. Syringe the trees twice daily, and afford plenty of water to the roots, and weak guano-water or other liquid-manure to those growing in small or confined borders. When the first crop on these trees show signs of ripening, treat as advised above for pot-trees. To be in the best condition, the fruits should be allowed to ripen on the trees. Later trees should be attended to in the matter of disbudding, stopping, and tying, being careful not to overcrowd the young growths.

### PLANTS UNDER GLASS.

By Jno. McINTYRE, *Gardener, Woodside, Darlington.*

**ACHIMENES.**—In these we have a class of plants not so largely grown as they were formerly, which are alike useful in indoor decorative work, and for filling baskets of open wire-work and suspending in the stove, intermediate-house, or conservatory during the summer. Planted in 5 and 6-inch pots, they form suitable subjects for filling vases, and in other methods of decorating apartments. The plants which were started some few weeks ago and transferred to pots or baskets, will require support from small sticks, and to be removed into a house or pit having a lower degree of warmth than that hitherto afforded; and this should always be done preparatory to taking the plants to a cool conservatory, greenhouse, or other comparatively cool structure.

**PROPAGATION OF STOVE PLANTS.**—If plants of *Oplismenus Burmani variegatus* (Panicum), and potsful of *Selaginella* are wanted in considerable number for various purposes, preparations should be made at this season. *Selaginellas* should be divided, and five small tufts put on to 4-inch pots filled with soil, and pegged down, make pretty plants in a few weeks. The soil employed should consist of leaf-mould, with a moderate amount of silver-sand added. Where there is a good stock of *Oplismenus*, plenty of well-coloured cuttings will now be obtainable, which, if rooted at this season, will be found to be of great use in the autumn and winter. Many other species of stove plants, if required in the autumn and later, are the better for being propagated in the month of May, as they retain their freshness and colour of leaf to a greater length of time than plants raised earlier in the year.

**THE CONSERVATORY.**—The present affords a suitable season to put the larger-sized plants in the conservatory in good order. Palms which may have been used in the stove to assist the spring display, or induce early growth, may be safely placed in the conservatory for the summer; tree Ferns not being tropical species may also be placed therein. The conservatory forms a good place for *Cattleyas* if it be suitable as regards lighting and ventilation; and the plants if in bloom form charming subjects to dot about amongst the more permanent inmates. If care be taken to keep the material about the roots on the dry rather than the moist side, they will do much to enliven the scene.

**LAPAGERIAS.**—When planted out *Lapageria rosea*, and the white-flowered variety of it, are allowed to commingle, a fine effect is produced. *Lapageria rosea* is a plant sometimes found difficult to manage, even under the best kind of treatment, but some of these failures may be traceable to a bad method of planting or potting, as the case may be, or to the compost used. The plant dislikes heavy soils, however good in themselves. It must have perfect drainage, or it soon gets into ill health. The kind of compost I have often recommended consists, for large plants in pots or borders, of two parts good turfy loam roughly broken up, one part good leaf soil, one part peat roughly broken in pieces, one part sandstone broken of Walnut size, and one part charcoal. In this kind of soil the plants thrive so long as the drainage remains in good order. Copious applications of water are essential to rapid growth, and the plant does best in a cool temperature and partial shade. Specimen balloons should be grown in the *Erica*-house. Much attention is necessary when the plants are making growth to regulate the shoots betimes, that is before they become entwined; afterwards this cannot be done without damaging the shoots.

### THE ORCHID HOUSES.

By W. H. WATTS, *Orchid Grower, Burford, Dorset.*

**TEMPERATURES.**—During the warm sunshine and cold north-easterly winds which are prevalent at this season, much care is necessary to prevent great fluctuation in the temperature of the houses. In the warm-houses very little ventilation will be required by night, but just a crevice at the top should be left open, so that the superfluous moisture may escape. The cool-houses should be well ventilated through the bottom-lights, but if there is any likelihood of the flowers becoming spotted through excess of moisture, air should be admitted at the top, always using the ventilators that are on the sheltered side of the house. Inexperienced cultivators are apt in early morning to damp the houses if they appear the least degree dry, whether the temperature is right or not, and immediately the sun shines upon the house to open the ventilators, and in a short time afterwards to

pull down the shading. More often than not, if the ventilation is not reduced when the blinds are pulled down, the atmosphere being at nearly saturation-point, the temperature will fall considerably. Such practice is one of the principal causes of spot and disease. It is, therefore, of the greatest importance that no damping-down should be done until the following temperatures in the separate divisions are obtained. The East-Indian house should be about 70°, *Cattleya* and Mexican, 65°; intermediate, 60°; and the cool-house a trifle above 50°. It is not always safe to increase the ventilation immediately after damping-down, because, as a rule, the sudden rise in the thermometer is caused by the evaporation of moisture unavoidably thrown on the hot-water-pipes. After this has passed away, and the temperature commences to ascend again, air should then be gradually admitted, but when it is necessary to shade the plants, the thermometer should again be consulted. If it is inclined to fall, the air must be admitted in less amount, until the temperature again rises.

**PHALANOPSIS** generally commence their growth in spring, and many of them are now sending up fresh leaves, and rooting freely. All plants which are not in bloom should be examined to ascertain if fresh material is necessary, or greater space required for root-extension. They may be grown in pots, baskets, or cylinders, which should be filled to three-fourths of their depth with new crocks, the plant placed in the centre, with the collar well above the rim of the pot, &c., the roots spread out, and carefully working in amongst the latter sphagnum-moss and finely broken crocks, pressing it moderately firm around the base of the plant, then cover the whole with freshly-gathered sphagnum-moss. Previous to using the moss it is advisable to thoroughly examine it for slugs. Newly-imported plants should not be allowed to remain long on blocks, or the plants will eventually deteriorate. It is best to carefully take them off immediately growth or root-action commences, and place them singly in small pots or baskets. If the plants are thoroughly well-rooted upon the imported blocks, they should be dipped in tepid water for a few minutes, so that the roots may be detached from the wood with as little damage as possible. For the first few weeks after root-disturbance these plants require very careful watering. Instead of the usual dipping it is safer to sprinkle with water from a fine rose watering-can, the surface moss and the sides of the basket, taking every precaution not to allow the water to get into the centre of the plants, or the latter will decay. When firmly re-established and the young leaves are advancing in growth, the potting material should be kept moist. *Phalanopsis* grow naturally in an atmosphere that is nearly always at saturation point, therefore this should be imitated as closely as possible. Where no separate house is provided for their cultivation, the best position for them is on the shady side of the East Indian-house, or the ordinary plant-stove. Freshly-imported plants, and sometimes those that have been disturbed by re-basking, now and then send up flower-spikes, and if these are allowed to flower before the plant is firmly rooted, its constitution will be considerably weakened. Moreover, a careful periodical sponging of the leaves with soft water is advisable, cleanliness being one of the principal points in their cultivation.

### THE KITCHEN GARDEN.

By C. HERRIN, *Gardener, Drapmore, Meidenhead.*

**SEAKALE.**—The shoots of the earliest-planted Seakale, being now well above the ground, should have the superfluous ones removed, leaving one only to each root, which should, of course, be the strongest. After this thinning is done, and the shoots cleared away, a small quantity of salt should be sprinkled between the rows, and the soil stirred with the Dutch-hoe, which will bury the salt and prevent the surface from cracking by heat and drought. Very little attention is needed by Seakale after this thinning has been done, beyond keeping the land free from weeds. Where a plantation is allowed to stand for a period of three or more years, and it is forced with stable-manure and tree leaves, or simply covered with some blanching materials for furnishing the last supplies, any covering now remaining should be removed, and the shoots still left on the crowns taken, together with half an inch of the latter. Vacancies should be filled up, and the soil dug over a few inches, having first afforded a dressing of rotten manure.

**CELERY.**—The most forward batch of plants will be now fit for planting in the trenches, and no time should be lost in performing the job. The usual

method is to plant two rows in trenches made 2 feet wide, and 4 to 5 feet apart, the soil being dug out of the trenches to the depth of one spit, and banked up at the side with a good batter, and made smooth with the spade. The soil at the bottom of the trench should be well broken up, and a layer 4 inches thick of rich rotten dung dug in, and in light soils a liberal dressing of salt may also be dug in with the latter. The manure should be buried just so deep as will bring it within reach of the roots as soon as the plants begin to grow. The dug ground in the trenches should be made quite firm before the planting takes place. The plants should be set out at a distance of 9 to 12 inches apart, the plants being intermediate in one row with those in the other. To obtain extra large heads, plant one row to a trench, at 1 foot apart.

**BROCCOLI, ETC.**—Seed of such late varieties as Model, Late Queen, and Methven's June should now be sown, also another small sowing of the Leamington, one of the best mid-season varieties. Further sowings of Savoys may likewise be made, a late sowing of the Drumhead Savoy furnishing heads in mid-winter, and later. This large-growing variety, when sown at this date, and planted on rather poor ground, loses much of its coarseness, withstands severe weather, and affords a good supply for the servants' table.

**SPINACH.**—Sowings should continue to be made according to requirements on cool, moist land. The spring-sown plants, and those which have stood the winter, are affording plentiful gatherings, but they ought not to remain on the land longer than is absolutely necessary. It is good practice to dig in the plants when done with.

**NEW ZEALAND SPINACH,** as a substitute for ordinary Spinach, in the event of a very dry summer, should always be sown in small quantity in heat, the plants being put out in the open quarter when large enough. The seeds may be sown to the number of three in 4-inch pots, placed in a Melon-pit or similar structure; and when the seedlings appear they should be reduced to one in each pot. When a few inches high, the plants should be gradually hardened off, and finally planted out at 3 feet apart. From twelve to twenty plants, according to the size of the establishment, will meet all likely requirements.

**ONIONS.**—The weather having been very trying for all recently-transplanted subjects, applications of water will have been necessary to enable the Onion plants to become established, and will continue to be necessary during the prevalence of dry weather. The Onions sown in the open quarters have braided well, and the plants are now strong, but they are greatly in need of rain. The ground between the rows should be stirred with a Dutch-hoe, and weeds growing in the lines pulled up. Thinning the plants should be deferred till rain comes. If dry weather continues, it will be advisable to occasionally spray the Onion-beds towards the evening with a solution of soap-suds and petroleum, to ward off attacks of the Onion-fly. A wine-glassful of petroleum to 3 gallons of soft-water, with just enough soap to make the oil mix freely, will be strong enough, and will do no harm if it be kept well agitated whilst being used.

### THE HARDY FRUIT GARDEN.

By G. WOODGATE, Gardener, Rolleston Hall, Burton-on-Trent.

**RASPBERRIES.**—Suckers grow abundantly at this season, and all those springing up in the alleys should be pulled up as soon as ever they are tall enough to be seized by the hand; and of those which spring up in the rows or around the stools, the weakest should be taken away, leaving from six to eight of the strongest to form canes for next year's fruiting. Blackberries require a similar kind of treatment, and as many of the strongest shoots or suckers growing nearest the stem saved for replacing the fruiting-canecan of the present season. A fair number of these growths to leave on a plant is from four to six for tall varieties, such as *Rubus laciniatus*, and six to eight for dwarfier ones, such as *R. Wilson*, *Junior*. The long canes of *R. laciniatus* soon get crowded with young shoots, and if fine fruits are looked for, these should now be reduced in number by removing the weaker; and those that remain should not be less than 6 inches apart. One or two good waterings with manure-water afforded at this season strengthen the shoots and increase the size of the fruits.

**OUTDOOR VINES.**—These plants, now starting into growth, should have all superfluous eyes rubbed

off; and it adds to the productiveness of the Vines to lay-in some strong young canes annually, and cut away a corresponding number of the old ones in the autumn, after the bunches are gathered. These young canes should be strong ones which have their origin on the upper side of the old rods, for the sake of convenience in laying-in. These young shoots will need regular attention in the matter of laying-in, or many of them will be broken off by the wind.

**PEACHES, NECTARINES, ETC.**—With frosts more or less severe nearly every night, the average being about 4°, trees not furnished with much foliage should still be covered at night. Up to the time of writing, very little damage has been done by frost, owing doubtless to the dryness of the air and the soil; another reason may be that the frosts have always passed off before daybreak, with the exception of sheltered places and low-lying grounds.

**WATERING.**—Trees, young and old, which were planted or lifted in the autumn and winter, especially such as are situated against walls having a south or west aspect, and in situations much exposed to wind and sun, will be benefited by the soil being afforded a copious watering, and the tops a daily syringing early in the afternoon for some time to come.

**INSECTS.**—If any of the Apple trees are infested with American blight, *Aphis lamigera*, the floccose patches should be dabbled with a small brush dipped in petroleum, or methylated spirits, which will at once destroy the aphid hiding therein.

### THE FLOWER GARDEN.

By HEDLEY WARREN, Gardener, Aston Clinton, Tring.

**SPRING BEDDING.**—Now that the plants are on the wane, notes should be made of desirable improvements in the arrangements of the flowers for another year. Beds that are getting unsightly should be at once cleared of their plants and prepared for the reception of the summer bedding-plants. In lifting the various kinds of bulbs, the foliage should be kept uninjured if the bulbs are to be planted in the wild garden, or used for other purposes another year. Lay the roots in a light airy shed to mature before storing them. Polyanthuses, Primulas, and similar plants, of which a stock is usually raised by division of the roots, should be carefully lifted, divided, and re-planted in the reserve garden, affording them water copiously at the time and whenever the soil gets dry.

**HARDY ANNUALS.**—Seed may still be sown for succession, and those sowings which are advancing in growth should be thinned out before over-crowding has begun, otherwise weak weedy growth will result. Afford the plants water frequently in dry weather, doing so in the afternoon.

**SHRUBS, ETC.**, planted during the past season will need much care in the matter of affording water and syringing the heads, or many failures will occur from the parching character of the season.

**THE WILD GARDEN.**—Bulbs and other spring plants here or growing in patches on the lawns should not have their foliage cut down till it is of a yellow colour, unless expense be not studied and plantings are annually made.

**MIXED BORDERS** may shortly be planted with a variety of plants for the summer, and the planting-out of these will dispense with much labour in keeping the plants in boxes, frames, &c. These consist of Ten-week and other Stocks, Zinnias, Marigolds, Larkspurs, Scabious, Hollyhocks, Verbenas, scented-leaved Pelargoniums, and many other species, which may be used to advantage in these borders; besides, odd plants of almost every description may be used.

**BEDDING-OUT.**—A beginning should be made of the planting out of all plants used in beds, excepting the more tender ones. It may be here remarked that the style of bedding adopted should be in harmony with the surroundings generally, and distinct styles of bedding adopted in various parts, if the grounds are of great extent and will admit of it being done. Masses of colour look best in large beds situated at good distance from the windows of the house, the tastes of the family being, of course, studied in bedding-out. When a number of beds have been planted, some protective material should be put in readiness for use in shading from sunshine or protecting from frosts, of which last we are still likely to have an experience.

**BEGONIAS** of the tuberous-rooted section are some of our best bedding plants, and although they appear

to the greatest advantage when planted in masses together, yet by way of a change they may be used in other ways; as, for instance, planted in a fairly large bed alternately with *Fuchsias*, tall plants of *Heliotrope* or Ivy-leaved *Pelargoniums*, the ground under them being carpeted with *Harrison's Musk*, *Lysimachia Nummularia aurea*, or *Alternantheras*. This mixture makes a pleasing and effective bed.

**LAWNS, GRASS VERGES.**—Will require to be frequently mown with the machine, and this kind of work, together with the cutting out of corners and around trees and shrubs, which cannot be reached by the machine-mower, will now entail much labour. Lawns which may have been sown with grass-seeds, or turf which has been relaid this season, should have a thorough application of water if the soil or the new-laid turves show cracks or shrinking, and no very close mowing done for a time, the grass itself forming a partial shade to the roots.

### THE APIARY.

By EXPERT

**HONEY GATHERING AND SWARMING.**—This month promises to be a very good one for the bees, fruit trees being so heavily-laden with bloom, and the weather so mild, has enabled them to make a very good start, and with the opening of May, the swarming season will have commenced, and of course, by this time feeding will have been discontinued in most districts. And all bee-keepers should be prepared for a busy time, and have the hives ready to receive swarms, if they wish to increase their stock, or if not have their customers ready to whom they may dispose of them; on the other hand, if a large quantity of honey is wanted, the queen should be taken away, and the swarm returned to the parent stock, the queen being either sold or transferred to one of the old stocks which has an old or infertile queen, which if left in the hive is a source of great disappointment. After taking a swarm which, as a rule, issues from the hive from 11 a.m. till 2 p.m., and sometimes later, secure them in a clean skep, rubbed with a little syrup and elder leaves, as a precaution against their forsaking it. If the bees are flying very high and do not look very likely to settle, syringe them with an ordinary garden-syringe, which will induce them at once to cluster. You can either return the swarm at once, or better still, I think, leave them till the evening, and then return them, which is easily done by placing a board (clean paste-board will do), on a slight incline towards the entrance of the hive, as bees travel much better up-hill than down; also raise each side of the hive a little to allow the bees more room to enter. Gently smoke and sprinkle them with a little flour or weak peppermint and water, they will not swarm again for about six or seven days; and to prevent this altogether cut out the queen cells, and it is also a good plan to keep the drone comb cut out. I would advise all beginners to use a veil, but not gloves if possible, as they are very clumsy, and very much interfere with the work, but if one is nervous and has to use them, they will soon find, as confidence is gained, that they may be discarded. All the manipulation of the apiary should be done very gently, taking care not to knock the hive more than possible, as it induces them to sting. Stings, as we know, are dreadfully painful, but I think if pure ammonia be used at once, very little pain will be felt; if this be not at hand, a little common soda wetted and rubbed on the sting will afford relief.

**FOUL BROOD.**—It is as well to look through hives now, as foul brood can be very easily discovered before the bees have fairly commenced working. I am sorry to say this disease is getting very prevalent in most parts of England, and if not checked at once, will seriously interfere with the honey production of this country.

**SELLING PRODUCE.**—All who are interested in bees should find out which is most marketable in their district, bottled honey or comb in sections, and work their hives accordingly; if for run honey, use shallow frames, or if for section, fill mostly with 1 lb. sections, taking care to always purchase good foundation, which the bees take to very readily.

**"CULTURE DES CHRYSANTHÈMES."**—The above is the title of a French book recently published. The authors are Messrs. G. CHABAUNE and A. CHOULET of Lyons. The subjects dealt with are more suitable for Continental cultivators than English. Messrs. RIVOIRE & SONS of Rue de l'Algérie, Lyons, are the publishers.

## APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	MAY 19	Great Show of the Royal Horticultural Society in the Temple Gardens (3 days). Devon Agr. Soc. Sh. at Plymouth (3 days).
THURSDAY,	MAY 21	
FRIDAY,	MAY 22	Whitsuntide Exhibition at the Manchester Botanic Gardens. Roy. Bot. Soc. Lecture.
<b>SALES.</b>		
MONDAY,	MAY 18	Special Sale of Orchids in Flower and Bud, at Protheroe & Morris' Rooms.
THURSDAY,	MAY 21	Unreserved Sale of Bedding Plants, at Point House, Blackheath Hill, by Protheroe & Morris.
FRIDAY,	MAY 22	Orchids, from Messrs. Sandier & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK—55°5'.

In the current number of the *Orchid Review* Mr. CHAMBERLAIN finds time to protest against the present state of anarchy as regards the nomenclature of garden Orchids. Botanists do not agree at all points upon questions of this sort, but, at least, they act on some definite principle, and it is easy to consult their records and become acquainted with the methods of individuals. It was hoped that when the Nomenclature Committee issued its code that horticulturists also would adopt the rules, and that there would be less reason for protests such as Mr. CHAMBERLAIN now makes. Unfortunately, things go on as before, if not worse. The Orchid Committee is blamed for this state of things, and, to some extent it is doubtless responsible. It must, however, be borne in mind that the ordinary meetings of the committee afford no more fitting opportunities for the discussion of intricate points of affinity or nomenclature than the House of Commons does for the consideration of the racial differences between Boers and Kaffirs, Tentons, and Britons, or the limitations geographic and otherwise between Venezuela, Guiana, and Brazil. One way out of the difficulty is to appoint a committee of experts to determine the general points at issue, and arrive at some conclusion, arbitrary or otherwise, on points of detail as they arise. This, as has been stated, has already been done, so far as generalities are concerned—but who pays heed to the enactments? Who is to enforce them? The rules for nomenclature, with one or two exceptions, where commercial bias was allowed to over-ride scientific interests, are very good as they stand, and if people would only follow them there would not be much to complain of.

The special point raised by Mr. CHAMBERLAIN is as to the nomenclature of crosses and reversed crosses. Thus, there is a cross between *Masdevallia Shuttleworthii* and *M. Harryana* recognised as *M. Shuttleworthiana* ×. When Mr. CHAMBERLAIN sent an example from the same parentage, but reversed, namely, *M. Harryana* × *Shuttleworthii*, he—note the he—proposed to name it *Chamberlainiana*. The Orchid Committee, it appears, declined to recognise this name, and called it *M. Shuttleworthiana*, Chamberlain's variety. Naturally, Mr. CHAMBERLAIN doubts if he shall have sufficient patience to use so lengthy an epithet. Mr. CHAMBERLAIN goes on to accuse the Committee of various inconsistencies and anomalies, and we have no doubt that in the main the verdict must be in accordance with the prosecutor's charge.

These difficulties afford an illustration of a point, that it is very difficult to get committees, and specially amateurs, to appreciate—and that is, that it is, as a rule, not desirable to apply

to a plant a name descriptive of its peculiarities or indicative of its history. They do not realise that a name should be a name, and nothing else. It should not be a description, still less should it be a detached fragment of history. Nothing but confusion arises from the attempt to blend nomenclature with description, and specially with the history of the plant. This is hard to realise at first, but those whose business it is to work out monographs and descriptions, soon find out the inconvenience which arises from using for other purposes a tool intended for one usage only.

In the case of garden hybrids, obverse or inverse, we are strongly of opinion that the Latin system of nomenclature adopted by botanists, should not be followed, but that the practice of the florists should be adopted. If a plant, cross, or reverse-cross, is good enough and distinct enough, from a garden point of view, to have a name, let a name be given, irrespective of the history of the plant. Let the name be of such a character as not to be liable to be confounded with the Latin or Latinised specific names used by botanists. When a Latin name is used by a botanist, it is, or may be assumed to be, applied *secundum artem*. There is, that is to say, at least some guarantee that the plant has been carefully studied, described, and comparison made with allied plants. When a plant comes before the Orchid or the Floral Committee, the object is not to illustrate its botanical history, but to ascertain whether, in the judgment of that committee, the particular plant is, or is not, worthy of commendation for cultural or decorative purposes. If it is not, it may still get a "Botanical Certificate!" a distinction which the committee as a body is not competent to give, because unable for the most part to assign a reason for the award. A botanical certificate should take precedence of all, but in practice it is the least regarded.

Assuming that a name should be given, who should give that name? So far as botanical points are concerned, there is, of course, no difficulty in answering that question; but in the case of a plant of garden origin, whose interest is of a commercial or purely decorative character, we may still ask—Who should give the name? The owner, the raiser, the importer, the exhibitor, or the committee? Mr. CHAMBERLAIN, as we have seen, named his own plant, and we do not see who can deny him that right if he chooses to exert it, but no one else is bound to accept it. It would however, be a matter of little consequence who gave the name if the committee did its duty. The main function of the committee is to select the best from its point of view, to adopt the name given, no matter by whom, provided it is not pre-occupied or incorrect, and that there is no other objection to its use, and to pass over all others.

To make the Orchid or the Floral Committees into Nomenclature Committees is to attempt the impossible. Whether a special sub-committee to investigate and report on doubtful points as they arose could be established, is another thing. We should like to see it done.

Mr. CHAMBERLAIN goes on to suggest that the Royal Horticultural Society should affix a hall-mark to such Orchids as are exhibited before it, and which are deemed worthy of such distinction. This seems to us pretty much what the Society does already. A plant to which a First-class Certificate is awarded has a label affixed to it, as Mr. CHAMBERLAIN suggests. This gives the plant a money-value greater than attaches to one not so differentiated. Still, for

all that, we should recommend the "prudent collector" to follow Mr. CHAMBERLAIN'S advice, and cease to buy varieties "till he has seen them in flower."

The Temple Show.

RUMOUR has it that this show is to be larger and bigger than ever.

Such rumours always obtain currency before the event, and therefore we do not attach to them any special significance. We do, however, earnestly hope that the favourable opportunity this show offers will no longer be thrown away, but that some means will be taken to group the plants more effectively, to limit the numbers shown, and to place trade-labels where they may be seen, but where they do not interfere with the view of the plants. There may be serious difficulties as to the first point, there need be none as to the second and third. In former years, whether they were Orchids or whether they were herbaceous plants, they were so packed and jammed together that it was difficult to see them at all, and all attempts to distinguish the peculiarities of individual plants were in vain; at the same time Messrs. So & So's obtrusive labels were well calculated to conceal what people wanted to see. These defects need surely not be perpetuated. We plead also for a separate tent, or a separate table at least for novelties and plants of special interest. These to experts constitute the most important part of the whole exhibition; the rest is a mere show, such as may be seen at York one day, at Shrewsbury another, and of which a visit to the nearest nurseryman or florist, or to Covent Garden Market, will generally give a sufficient idea.

**ROYAL HORTICULTURAL SOCIETY.**—The ninth great annual flower show of this society, held in the Inner Temple Gardens, will open on Tuesday, May 19, and it promises to be quite equal to the usual standard of excellence obtaining at these shows. On Wednesday, May 20, the Great Western Railway will run cheap trains from Cardiff, Newport, Chepstow, Lydney, Newham, and Stroud to Loudon, and gardeners may prolong their stay in London if they wish until as late as the 25th inst. The London, Brighton, & South Coast Railway are also running cheap trains to London Bridge and Victoria on the same date. At 10.30 a.m., May 19, the appointed judges will meet at the secretary's tent, and at 11 a.m. the Fruit, Floral, and Orchid Committees will also assemble. Owing to the great pressure upon the society's officials, any plants, &c., intended to be shown for Certificates cannot be entered on the morning of the show. *John Wethers, Assistant Secretary.*

**"INDEX KEWENSIS."**—The manuscript of this monumental work has been preserved. It occupies 128 thick folio volumes, in addition to eight volumes containing names which, for one reason or another, have been omitted from the printed text. For garden purposes this manuscript list will be valuable as containing references to names not otherwise easily accessible.

**THE ROYAL SOCIETY.**—Of the fifteen candidates recommended for election this year, not one is a botanist or horticulturist.

**TULIP SAMUEL BARLOW.**—Our raiser of Tulips having striven for years to obtain flowers from which the objectionable dark stain present in nearly all of the older varieties of Border Tulips is eliminated, are happy in having met with success; and we now possess rectified flowers of English origin—bybloemen, rose, and bizarre—with a stainless yellow or white ground at the base. We illustrate (fig. 99, p. 615) one of Mr. STORER'S raising, called after that fine old florist, Mr. SAMUEL BARLOW, which was shown at the meeting of the Royal Horticultural Society on May 5 by Messrs. P. BARR & SONS. It is a well-formed flower, with broad, almost circular segments, a ground-colour of yellow, streaked with an intense shade of purplish-crimson; anthers blackish-crimson, and stigma and ovary of a pale green colour.

**THE PRESENTATION OF THE VEITCH MEDALS.**  
—Sir J. TREVOR LAWRENCE, the president of the Royal Horticultural Society, has undertaken to present the medals at the Drill Hall, Westminster,

**EXPRESS POSTAL DELIVERY SERVICE.**—The special attention of merchants, salesmen, and others in the London markets is directed to the advantages which the Express Delivery Service affords to them

an express fee of 3*d.* in stamps in addition to the ordinary postage, are sent out by special messenger immediately after receipt at the office of delivery in London, during such hours as the markets are open, instead of being kept for delivery by the postmen on their ordinary rounds. For example: An express letter from Grimsby addressed to Billingsgate Market, or one from Liverpool addressed to Smithfield Market, reaching London by the night mails, would be delivered soon after 5.0 A.M., whereas ordinary letters arriving by the same mails would not be delivered until about 8.0 A.M. An express parcel for Covent Garden Market sent from the West of England by the night mail would be delivered at from 5.15 to 6.15 A.M., but an ordinary parcel would not be delivered until an hour and a quarter later. Express letters, &c., reaching London by day mails are delivered by special messenger from one to two hours earlier than if they were taken out by the postmen in the ordinary way. Salesmen, &c., desiring to take advantage of the system, so as to obtain their orders, advices, &c., early, should request their correspondents to write the words "Express Delivery" boldly and legibly above the address on the left-hand corner of the cover of the particular letter or parcel intended for delivery by special messenger, and to affix to each article an express fee of 3*d.* in stamps in addition to the ordinary postage. The covers of express letters should also be marked with a broad line from top to bottom, both on front and back. Express mail letters may be posted in any letter-box; but where possible it is better, in order to prevent risk of delay, to hand them in at a post-office. Letters, &c., arriving in London by the ordinary inland or foreign mails, and which have not been marked for Express Delivery by the senders, can be delivered at any address in this district by special messenger, either occasionally or regularly, at the request of the addressee, about half an hour earlier than they would be if included in the ordinary delivery by postmen, on payment of an express fee of 3*d.*, and 1*d.* for every ten or less number of additional letters, &c. beyond the first. The addressee must fill up a form of application, which can be obtained at any post-office, and send it by hand or by post to the postmaster of the district in which the address is situated. Further particulars of the Express Service can be obtained at any post office, or on reference to pages 17 and 326 of the *Post Office Guide* (published at 6*d.*), or to page 32 of the *Post Office Handbook* (published at 1*d.*).

**ROSE SHOW FIXTURES IN 1896.**—The following additional dates of Rose shows are sent by Mr. EDWD. MAWLEY, viz., July 1 (Wednesday), Faringham; 2nd (Thursday), Bath; 9th (Thursday), Woodbridge.

**GEORGE PRINCE MEMORIAL PRIZE FUND.**—The following additional subscriptions have been received: Messrs. W. & H. Burch, 1*l.*; Rev. George Jeans, 5*s.*; The Rev. Th. N. Flintoff, 1*l.* 1*s.*; Mr. Geo. Mount, 10*s.* 6*d.*; Dr. Seaton, 10*s.*; Mr. Geo. Moulès, 5*s.*; Captain Christy, 1*l.*; Col. Pitt, 2*l.* 2*s.*; J. H. Arkwright, Esq., 1*l.*; Conway Jones, Esq., 10*s.*; Messrs. Harkness & Sons, 1*l.* 1*s.*; A. Tate, Esq., 1*l.* 1*s.*; Messrs. D. & W. Croll, 1*l.* 1*s.*; F. Dennison, Esq., 10*s.* 6*d.*; Mrs. Dundas, 5*s.*

**FATHER DELAVAY.**—We had recently to announce the death of this intrepid explorer. We allude to the circumstance again to show how much remains to be done and known in systematic botany. By some people it is considered that this department is so nearly worked out that little or nothing remains to be done. The record of Father DELAVAY's discoveries in Yunnan may do something to dispel that notion. According to the *Bulletin of the Botanical Society of France*, Father DELAVAY, a Savoyard and a mountaineer by birth, explored the difficult mountain regions of Yunnan to such purpose that he discovered more than fifty new species of Rhododendrons, as many species of Pedicularis, forty new Gentians, and as many Primulas. On the whole, he has sent to the Herbarium of the Jardin des Plantes about 4,000 species, half of them new!

FIG. 99.—TULIP SAMUEL BARLOW. (SEE P. 614.)

on Tuesday, June 9, at 3 P.M. The recipients this year are M. H. DE VILMORIN, Paris; Prof. SARGENT, Boston; Mr. M. DUNN, Dalkeith; and Mr. F. W. BURBIDGE, Dublin.

for obtaining important letters and parcels, &c., much earlier than in the ordinary course of post, more particularly in the morning. Letters and parcels marked "Express Delivery," and bearing

"BOTANICAL MAGAZINE."—The plants figured in the current number are the following :

*Ostrya magnifica*, Regel.—A hardy perennial Campanulaceous plant of imposing appearance (figured in *Gardeners' Chronicle*, 1888, ii., p. 65, f. 6) ; t. 7472.

*Pittosporum cricocarpum*, Royle.—A West-Himalayan shrub, with stalked oblong acute leaves, with white nerves on a deep-green ground (according to the figure). The flowers are yellow and borne in panicles. The plant was figured from the Marquis HANBURY'S garden, Mentone ; t. 7473.

*Cochlidia Neesliana*, Rolfe.—A Peruvian Orchid with the habit of *Odontoglossum*, and bearing racemes of reddish flowers (see *Gardeners' Chronicle*, 1894, ii., p. 71, f. 11) ; t. 7474.

*Coffea stenophylla*, G. Don.—A native of Sierra Leone, with lanceolate acuminate leaves, and clusters of white, six to ten-lobed flowers. It yields as freely as the Liberian Coffee, but is somewhat longer coming into bearing. It is said to have a superior flavour to the species last mentioned. Botanically it may be only a variety of *C. arabica*. Mr. SCOTT ELLIOT says it is more frequently cultivated in Sierra Leone than *C. liberica*, and, moreover, that it is wild in the hills (see *Kew Bulletin*, 1893, p. 167) ; t. 7475.

*Masdevallia corniculata*, var. *inflata*.—A yellow-flowered species, the solitary leaf and scape of which are enclosed within a loose inflated basal sheath ; t. 7476.

**SOCIÉTÉ FRANÇAISE D'HORTICULTURE DE LONDRES.**—For seven years past this society has been doing a steady but useful work in the horticultural world, and the time is not far distant when its influence will be recognised as universal. Many of the young French, Belgian, and Swiss gardeners who come to England to complete their business education, take up posts as professors, directors of botanical gardens, or large nurseries, and gardeners in large private establishments, all over the world. One of the most useful features of the society's work is the interchange of situations in England and France between young gardeners of both nationalities, and the founders of the society have in this branch contributed to a large extent to promote good feeling on both sides of the Channel. The *Annual Bulletin* just published shows a distinct advance on those of previous years, both in size and in quantity of literary matter presented, and will interest many others than the members. It contains the report for the past year, the rules, the lists of members of various grades, condensed reports of the monthly meetings, a very full account of the annual dinner held in January last, with verbatim reports of the speeches on that occasion, and the financial statement for 1895. A catalogue of the botanical and horticultural books in the library is also given. A large portion of the *Bulletin* is devoted to reports and papers read at the meetings by members, and these as usual, are varied and diverse in their extent. It is pleasing to note among the lists of members that many celebrated horticulturists on both sides of the Channel are supporters of the Society, which in no small degree owes its success to the indefatigable efforts of its genial President, Mr. GEORGE SCHNEIDER, whose labours in promoting good feeling between English and Continental gardeners and others, has recently been very properly recognised by the French Government conferring upon him the Order of the Mérite Agricole. Mr. LOUIS GENIL, of Clifton Hou e, 12, Ashburnham Road, Chelsea, London, S.W., is the Secretary.

**STOCK-TAKING: APRIL**—Considering the difference in the atmospheric conditions which ruled in April of last year, and those which obtained in the past month, a larger increase in the value and quantity of both imports and exports might have been expected ; but as the Trade and Navigation Returns just issued bear witness, the actual achievements are satisfactory, and—the political outlook being a clear one—give promise of even better things to come in the near future. The imports for the past month show a gain as compared with the same period last year of some £1,467,442, distributed over most

sections; the figures for the four months coming out £12,949,312 in excess of those for the same period in 1895—equivalent to over three millions sterling per month. Our usual record is to the following effect :—

IMPORTS.	1895.	1896.	Difference
Total value of imports	£ 34,341,358	£ 35,808,809	+1,467,442
(A) Articles of food and drink—duty free ... ..	11,385,692	10,377,028	-1,008,664
(B) Articles of food and drink—dutiable	1,871,632	1,886,232	+14,600
Raw materials for textile manufactures ... ..	7,092,876	7,911,840	+818,964
Raw materials for sundry industries and manufactures	3,005,206	3,324,050	+318,784
(A) Miscellaneous articles ... ..	1,241,123	1,291,680	+50,552
(B) Parcel Post ... ..	97,011	74,301	-22,710

In addition, it is shown that live stock have gained £293,375 over April in last year ; Tobacco, £48,688 ; metals, £331,418 ; chemicals, &c., have decreased by £43,410 ; oils have gone down in value to the extent of £35,734. Interesting as are always the figures connected with fruits, roots, and vegetables, those subjoined, to the initiated, are of more than usual importance :—

IMPORTS.	1895.	1896.	Difference.
Fruits, raw :—			
Apples ... bush	221,229	93,294	-127,935
Cherries ... ..	—	—	—
Plums ... ..	—	—	—
Pears ... ..	4,051	209	-3,842
Grapes ... ..	1,881	2,303	+422
Unenumerated ... ..	34,854	51,290	+16,406
Onions ... ..	470,437	359,680	-110,757
Potatoes ... cwt	778,671	63,439	-715,232
Vegetables, raw, unenumerated ... .. value	£86,250	£103,359	+£17,109

**THE EXPORTS**

for the past month show an increase over those for the same period last year, amounting to £1,174,388, and in the period under notice there was a decrease in only one section, i.e., raw material, £37,886. Amongst the "increases" the following are to be found : Live animals, £26,496 ; articles of food and drink, £29,526 ; yarns and textile fabrics, £394,474 ; metals and articles manufactured therefrom, except machinery, £484,452 ; machinery and mill-work, £97,541 ; apparel and articles of personal use, £105,043 ; chemicals, &c., £39,698. It continues to astonish some folk to learn that our customers abroad have ideas of their own as to taste and quality of goods—apart from the price thereof. Some of our consular agents repeatedly protest against the idea that purchasers will take just what we offer them. Germany and Switzerland have recently shown that they will make just what is ordered from them, and so we have lost the trade. We are not above sending abroad, as commercial travellers, men who may have plenty of "go" in them, but who are quite ignorant of the language and weights and measures of the country into which they have adventured. It may be plucky, but it is—well, not prudent or profitable. Of course, the great majority of our travellers are good linguists, with a fine style of work about them, and they are well supported by manufacturers in style and quality of exports.

**A NEW CHRYSANTHEMUM CATALOGUE.**—Mr. O. DE MEULENAERE, the well-known Chrysanthemum grower of Ghent, who published a very comprehensive Catalogue of Chrysanthemums and a supplement thereto a few years ago, has just brought out a second supplement containing all the novelties distributed between the years 1894—1896. The method adopted by Mr. DE MEULENAERE is similar to that in directories and kindred publications, the surname appearing first. Instead of the reader looking for a well-known variety like *Mdlle. Thérèse Rey* under the letter *M*, he would have to turn in Mr. DE MEULENAERE'S work

to *R*, where it appears as *Rey—Mdlle. Thérèse*. The advantage of this is obvious, for many exhibitors are quite indifferent as to whether they write surnames with their proper prefixes of *M.*, *Madame*, or *Mdlle.* Journalists, reporters, and others, who do horticultural literary work, will find Mr. DE MEULENAERE'S Catalogues of great service ; for, in addition to the ordinary description of each variety, he adds raisers' names and dates.

**A NEW FRENCH GARDENING PAPER.**—Gardening papers are not by any means so plentiful in France as in England. We have just received the first number of a new one, called *Nord-Horticulteur*, a little well-printed monthly periodical, that emanates from Lille. Among the principal contributors we notice the names of M. CHAS. BALTET, M. OTTO BAILLIF, M. PAUL HARIOT, Mr. HARMAN PAYNE, M. F. CAYEUX, &c. The Editor is M. V. BÉRAT, and the offices, 19, Rue de Pas, Lille (Nord), France.

**CHESHUNT, WORMLEY, AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.**—The usual fortnightly meeting of this Society was held on Thursday, May 7, in the Iron Hall, Wormley. H. NORTH BUSHEY, Esq., presided, and he was supported by Messrs. J. ROCHFORD, NIEL MACKENZIE, W. H. MILES, and WM. L. YATES, Secretary. Over 100 were present, and Mr. JOHN WRIGHT, F.R.H.S., delivered an excellent lecture, entitled "Grapes, from the beginning to the end." Mr. ALEXANDER DEAN then addressed the meeting, and, illustrated by diagrams, described the composition of borders, growth of Vines, roots, varieties of Grapes, stopping, thinning, pot Vines, &c. At the close, a hearty vote of thanks was accorded to Mr. WRIGHT and Mr. DEAN, on the motion of Mr. ROCHFORD, and seconded by Mr. N. MACKENZIE. At the next meeting, to be held on May 21, Mr. WM. L. YATES will read a paper entitled "The Culture and Varieties of the Gladiolus."

**THE AMERICAN FLORIST CO.'S DIRECTORY.**—A valuable handbook is this for those whose interests are connected with American horticulture. The Directory is not merely a list of the names and addresses of florists, nurserymen, and seedsmen of the United States and Canada, but mentions the national and local trade organisations, the leading parks and cemeteries, and trade statistics of those countries. There are also lists of the more usual florists' flowers and plants, with descriptions of the varieties, and cultural hints for all seasons. The whole is cast into a book of handy size, and issued from the offices of the American Florist Co., 322, Dearborn Street, Chicago.

**MANCHESTER WHITSUNTIDE SHOW.**—We are informed that the annual exhibition of the Manchester Royal Botanic and Horticultural Society, to be held at the Botanic Gardens, Old Trafford, will be opened by the Earl of DERBY on Thursday, May 21.

**TECHNICAL EDUCATION IN ABERDEENSHIRE.**—The scheme for the promotion of technical education carried on under the auspices of the Aberdeen County Council has, so far, been highly successful. Last year, the sum expended in this direction in Aberdeenshire was £1805, and about 700 pupils received instruction on various useful subjects. Another proposal will be brought before the next meeting of the Council, that the Technical Instruction Committee and the Secondary Education Committee of the county should be united as one body. Much might be said in favour of the suggestion, but the advantages to be derived from one administrative body being charged with the great work on hand are sufficiently obvious.

— Mr. JAMES HENDRICK, B.Sc., recently lecturer on agricultural chemistry at the Glasgow and West of Scotland Technical College, who has been appointed to the lectureship on Agricultural Chemistry in Aberdeen University, has commenced his work at Marischal College, Aberdeen. There was no formal introduction, matters being yet in their

initiation stages. Such students as come forward will receive instruction, but it is expected that it will be the winter session before a full start is made.

**A NATURALISTS' CLUB.**—It is proposed to establish a club upon the ordinary lines of a social club, limited to those interested in natural history, and offering to its membership, in addition to the advantages of an ordinary social club, the special advantages of a complete library and a museum of natural history, monthly meetings, general and sectional. Those interested in the matter should communicate with E. SCHENK, Esq., 1, Great College Street, Westminster, S.W.

**SCILLA VERNA.**—A flower of this has been sent to us from Central Scotland, nearly fifty miles from the sea on either side. The records give it as a coast-plant. Can any correspondent say how far from the sea the plant has been found? Possibly the bulb may have been introduced accidentally from a nursery.

**YORKSHIRE NATURALISTS' UNION.**—The one hundred and twenty-third meeting of this body of naturalists will be held at Hellfield, in connection with a four days' excursion, from Saturday, May 23 to Whit-Tuesday, May 26, for the investigation of Bowland. It will facilitate the secretaries' arrangements for conveyances, firstly, if as many members as can possibly manage it will attend the excursion; and secondly, if they will keep the local hon. sec. (Mr. Peake) promptly informed of their intentions. An additional reason for there being a good muster is that the district is not only rich and picturesque, but so far almost unexplored by naturalists. Newton-in-Bowland will be the centre for naturalists; Whitewell for geologists. Mr. R. H. Tiddeman, M.A., F.G.S., will take the leadership of the geological party, and the naturalists will have the benefit of the assistance of Mr. J. F. Pickard, Mr. W. Thistlethwaite, Mr. Thomas Altham, Mr. Marshall Demain, and Mr. T. Hartley; while the Rev. R. L. Jones, Vicar of Slaidburn, and other local gentlemen are taking interest in the visit. The single day's excursion will be on Whit-Tuesday. The various railways which have booking arrangements for Clitheroe, Hellfield, or Clapham, give the usual facilities to members and associates of the Yorkshire Naturalists' Union. The district is remarkably good for wild flowers, and great numbers of plants have been found within the last few years which were not noticed before. *Dunnow Cliff and Wood*, between Slaidburn and Newton, have a large variety of limestone plants, such as *Helianthemum vulgare*, *Potentilla verna*, *Viola hirsuta*, *Rhamnus catharticus*, *Euonymus*, *Scabiosa columbaria*, *Agrimonia eupatoria*, *Gentiana autumnalis*, *Paris*, *Convallaria*, *Cystopteris*, *Scopolendrium*, &c. In marshy places near the river, *Hypericum quadrangulum*, *Myosotis repens*, *Potentilla palustris*, *Sparanium simplex*; and along the river banks *Myosotis sylvatica*, *Iris pseudacorus*, *Trollius*, *Saxifraga granulata*, and *Thalictrum flavum*. Most of the moist meadows and pastures yield *Primula farinosa*, *Valeriana dioica*, *Pinguicula*, *Triglochin*, *Habenaria conopsea*, *Sagina*, *Pedicularis sylvatica*, and *Equisetum sylvaticum*. On the moors and in mountain glens and woods may be found *Trientalis*, *Andromeda*, *Vaccinium oxycoccus* and *V. Vitis Idæa*, *Empetrum nigrum*, *Viola palustris*, *Hypericum elodes*, *Limosella aquatica*, *Pedicularis palustris*, *Sanicula europæa*, *Ribes alpinum*, *Menyanthes trifoliata*, *Saxifraga Geum*, *Veronica scutellata*, *Polypodium phegopteris*, *P. dryopteris*, *Allosorus crispus*, and *Lycopodium Selago*. In the lanes, &c., near Newton, *Tanacetum*, *Veronica montana*, *Prunus Padus*, *Sedum acre*, *Chrysosplenium alternifolium*, *Geranium pratense*, *Viburnum opulus*, *Cardus heterophyllus*, *Trifolium medium*, *Asplenium ruta-muraria*, and *A. Trichomanes*. By the road to Lancaster, near the Trough of Bowland, are *Campanula hederacea*, *Drosera rotundifolia*, *Hypericum humifusum* and *Narthecium ossifragum*. *Ophioglossum* is abundant, and *Botrychium* occasional in the meadows. Furze and Broom are uncommon, at any rate near Newton. The moors between the Trough and Whitendale and Newton and Waddington Fells are rich in moor and bog plants.

## GRAPE CULTURE IN ITS COMMERCIAL ASPECT.\*

THE present remarks are confined to the Vine as grown under glass for producing Grapes for market purposes, although they in some respects might apply to general culture.

We have, no doubt, many times been bewildered by the advice and suggestions offered on the subject of the Vine, and many of us have seen measures of success in its cultivation under conditions most opposite—indeed, I think that the Vine itself is constitutionally adapted to endure widely different environments. But though there are often failures that perplex us, and, I must own it, great successes that astonish us, still they only lead the ardent grower to try and discover a definite method of practice that approaches his ideal of perfection. In considering the culture of the Vine from its commercial aspect we add a different view to the subject, for although growers might all somewhat agree as to methods of culture, and indeed all might be more or less successful, still when the laws of commerce are applied to measure the result I would make bold to say that such a thing as a living wage or profit would be often absent.

There is a very sharp distinction between a gardener—and he may be a very able and successful one—and a market gardener. The fact is, that when the rules and necessities of business enter the arena, then nearly all our cherished notions have to be squared with stern matters of fact. I shall never forget the first impressions and lessons I gained in Vine growing, in perhaps one of the most noted establishments. There everything was done in a manner that inspired awe, reverence, and mystery—the Vines were looked on as almost sacred, not to be handled by any but the most experienced man, and then only under the personal supervision of a still more learned foreman of the fruit department.

When I supposed myself to have had sufficient experience in that establishment, I came to a real market-growing place near London, then owned by one of the best growers and one of the best of men; but the practical experience I at once had there was of the opposite character, for I was the very first day put to tie down Hamburgh Vines, standing on an empty glass-box. This appeared to me to be profane; but I soon found that the commercial aspect of Grape-growing was altogether different in its methods from those prevalent in dual establishments.

There has been a wonderful revolution during the last few years in Grape-growing for market, not only as regards prices, but in methods; and if some of our forefathers could see now the large places that have developed from the foundations they laid, they would probably be astonished.

While speaking of the older generation, I would like to remark that, taking into account the difficulties with which they had to contend, I believe that they over and over again obtained results that we now-a-days with what we deem more scientific ways, and certainly greater advantages, often fail to equal.

All Grape growers of, say, fifteen to twenty years' standing, can tell tales of 20s. and even 25s. per pound for Grapes, and such prices as 5s. and 10s. were quite ordinary. Now-a-days, the prices obtained vary from 6d. to 5s., and yet during those times there were hardly any who launched out into building, or seemed to have had any idea of developing the industry. One can trace easily the evolution of the business to its present proportions.

What has especially tended during the last few years to increase Grape-growing is the popularity of the Tomato, for growers now can erect glass, at once growing Tomatoes, and thus having the houses in

profit, instead of, as in the old days, depending on other crops to tide them over till the Vines came into bearing. This advantage, of being able to have glass immediately in some amount of profit, would seem to point to a state of things that must tend to make the margin of profit on Grapes grow less and less—indeed, during the last three years, the fall in prices has been very marked, and as commerce is without sentiment or consideration, it leads only into paths where the fittest will survive.

There is no doubt that Grape-growing as an industry in the past, whatever may have been the cultural methods, has, from a commercial point of view, been carried on in a very homely, and, in many cases, uncommercial spirit. By this I mean that places have been added to from time to time, as means allowed, and that profits have been considered as the surplus over and above ordinary expenses, and no notice has been taken of depreciation.

The fact is, that while the Vines are young, say from five to ten years old, the produce both in quality and in quantity is much better than ever afterwards, and that in reality such good years recoup part of the actual capital, and unless considered as such the property becomes by natural depreciation of less value year by year, so that it is wise, as well as right in principle, that when one commences a Grape-growing establishment a proper system should be adopted in order to guard against what are only appearances of profit being counted as real profits. Such profits can only be known when the cash capital is guarded from loss. So that in speaking of a Grape-producing establishment of the present time, we have to deal with the circumstances as they now are, and only have the sweets of memory in regard to the past and palmy days.

The great change in the industry has been brought about principally by the enterprise of growers themselves, together with perhaps, during the last few years, a lessened spending power of the would-be consumer. The particular occupation of producing Grapes, or indeed any fruit under glass, with the exception of Pine-apples, is not under the ban of foreign competition so much as most other producing industries.

Indeed, the foreign fruit has probably prevented a greater fall in prices than has occurred, because its cheapness makes it as if there were a preparatory pioneer for the undoubtedly superior English produce, and by thus immensely enlarging the consumption of fruit, educating the consumer towards appreciation of the better article. Here I may remark that the grower who sets a high ideal of quality before him will be the best off in the end, as the prices obtained for the best goods is double that obtained for even second rate.

But to come to some more definite statements with regard to the practical procedure towards establishing and carrying on a place for the growth of Grapes for market purposes. In the very first place, I mention the choice of situation, taking carefully into account its accessibility to markets.

Much of the success of a Grape grower for profit lies within the plain ring of common sense, and that points to the immense advantage that a grower must start with if he, in every possible respect, enlists Nature and circumstances on his side.

That land would be best that has soil 2 to 3 feet deep, resting upon a subsoil easily drained. There should be ample means for obtaining abundance of water, and equally ample means for getting rid of the same. Whether the land is pasture or arable, is not vital, but of course preferably pasture; then its closeness to means of communication, especially with regard to fuel and carriage of produce to market, and these things may vary so much in different localities that, with all the best conditions appertaining to it, an acre may be cheap at £300, where in another locality it would be dear at £100.

Certainly, a most important point must always be the system of tenure. Whether the tenure is freehold, or long leasehold with an option to purchase at a fixed price, does not much matter, and in many cases, provided fixity of tenure is made the first consideration, and the increment of value in the land is

\* Paper read by Mr. Peter Kay, Clugmar Vineyard, Finchley, at a meeting of the Horticultural Club on May 5.

protected to the tenant by a fixed purchase sum, the leasehold will be preferable, as the capital can then be used to erect the necessary buildings rather than in being tied up in a less productive form.

Other things being equal with regard to the fitness of Vine-growing for profit, it is wise to give preference to land likely to improve into building-land; and further, it is better that such land as frontages, or other parts of a different value, not immediately necessary for the business, should be conveyed separately, thus not overweighting the enterprise with unnecessary charge, and also thus separating the eggs into different baskets.

We will suppose that the enterprising grower has secured land that he thinks suitable for the purpose, then he will proceed towards the erection of the vineries. Early autumn would probably be the best time to begin, so that the houses might be glazed in readiness for the early spring. The first glass that it is right to build is a propagating-house furnished with bottom-heat. Then the grower will be thinking of the sorts of Vines to grow—whether Hamburg, Alicante, Gros Colman, Muscat of Alexandria, and, if he is of a speculative turn, Canon Hall. These varieties are nearly the only ones that a commercial grower ought to go in for. The other varieties that are grown in less quantities are Madresfield Court and Gros Maroc. Appley Towers and other new sorts remain to be proved; but the beginner must not experiment too much, but grow tested sorts. In my opinion, the Alicante, taken as a whole, has been the most profitable variety to grow, not even excepting Muscat of Alexandria and Canon Hall.

It is a Grape of a very uncertain and risky nature, both on account of its constitution, and the great difficulty of fertilising it with any certainty. My own experience is, that taking houses of equal size, one planted with Alicante, one with Colman, and one with Canon Hall, and taking, say, five years' result of sales, the Alicante would come out best, the Colman next, then the Muscat of Alexandria, and last, the Canon Hall. This is against the general belief, but is true in my experience, for Muscats hardly make up for the lesser weight obtained from them, together with the extra waste in marketing, and their special liability to spider and shanking. The grower of Vines for profit must erect his glasshouse with the greatest economy, and with no further idea than that of covering in the greatest area with glass upon the simplest system, consistently with strength and practical usefulness, not looking to them lasting beyond the commercial life of the Vine, as replanting in the same structure is too expensive to pay.

(To be continued.)

## TULIPS IN PHILIPS PARK, MANCHESTER.

At this season, when the foliage is at its best, an oasis is found at Philips Park, amidst brickfields, factory chimneys, and the densely-packed habitations of the working population. The fresh foliage of the Poplar trees, enhanced by the green verdure of the lawns, makes it a veritable spot of beauty, compared with its surroundings. On entering the gate you are met with brilliant beds of Tulips, encouraging you to enter and admire. This was my experience a day or two ago, and very much to my surprise and delight a sight awaited me in the valley that I have not hitherto seen equalled in any public park in the provinces. Here you have a blending of colours with beds large and small, comprising about 100,000 Tulip bulbs, principally of the following varieties:—Artus, scarlet; Cottage Maid, rose and white; Crimson King, deep red; Dussart, vermilion scarlet; Joost van Vondel, deep crimson; La Reine, white with rosy tints; Potter, violet; Rosa Mundi, delicate rose; Yellow Prince, golden yellow. It is worth the trouble of every citizen to go and inspect what is a boon to the population of this barren district; to spend his or her leisure hours amongst such a galaxy of beauty. Taking the entire area of the park, its present condition reflects great credit upon the Parks Com-

mittee for the forethought shown in providing the public with such opportunities of enjoyment, and to the superintendent for the excellent condition in which it is kept. *R. R. T., in Manchester City News, May 9.*

## METHODS OF PROPAGATION.

(Continued from p. 580.)

APPLE GRAFTING.—The origin of the garden Apple is shrouded in the mists of ages, but I am inclined to think that when our remote ancestors painted themselves blue, and wore skin dress-coats with the tails hanging down behind, the boys of the period climbed the Crab-trees in search of the fruit, and got it—not unfrequently followed by the stomach-ache. It seems hard to believe, but is no doubt true, that our delicious varieties of to-day came from such very unpromising parentage, but there is little doubt that, by natural and artificial selection, we have arrived at our wholesome and appetising culinary and dessert Apples. Probably some Gilbert White of those remote ages noted a particular tree that yielded larger and sweeter fruit than ordinary, and still following up his observations, may have seen where two approximating branches of a Crab-tree had, by contact and abrasion, caused by the wind, united into one branch, suggesting "contact grafting" or inarching, and afterwards the ordinary process as we know it now.

Gardeners are well aware that if they sow the pips of a first-class Apple, the progeny may not be so good as the parent; but, on the other hand, there may be one marked exception. Naturally, this one distinct and superior fruit they desire to perpetuate by propagation; and to compass this they resort to budding and grafting. In Norfolk, and perhaps other counties of England, fresh trees are raised from "burr-knots," a local name for those gouty swellings seen on some kinds of Apple trees. These are caused by insect agency, though occasionally they result from fungoid growth. These ligneous tumours [masses of dormant buds. Ed.], as they may be called, are sawn off and planted just under the surface of the soil. Next year a number of thin shoots ("suckers") come up, and are allowed to grow till the autumn, when the burr is dug up, divided between the shoots, which, being quartered out in the garden, are ready in a year or two to plant out in garden or orchard. The well-known Dr. Harvey, so named from its raiser, is frequently increased in this manner, as are many of the cider Apples in Devonshire and Herefordshire.

The Crab (*Pyrus Malus acerba*) is the stock chiefly employed in nurseries to raise standard or orchard-trees, and also for some kinds to form bush, or pyramidal, and espalier trees. The fruit of this handsome native tree was used, among other purposes, to make a primitive kind of vinegar, called verjuice, a name embalmed in that common expression, "as sour as verjuice." But now it is put to make nothing worse than cider, though I have failed to discover where the verjuice ends and the cider begins, in much of this beverage sold in many country places, where I have been persuaded to "take a cup." The grafting process is very easy in the Apple, the bark being thick and tough, and not so easily bruised as some in other fruit-trees.

The best time to operate is early in April, but the scions required should be taken off in February, selecting only the stout, free shoots of previous year's growth, and laying these in the ground to the depth of 3 or 4 inches, till wanted. The process is the same as that for the Pear, and the stock is selected according to the kind of tree required. If to furnish the cordon, pyramidal, or espalier form of tree, the Paradise stock is the most suitable, but it should be the English or Nonsuch variety, as the French is only adapted for raising trees for pot-culture in orchard-houses, and is not hardy enough for outside work in Britain. There is an intermediate stock called on the Continent "Doucin," a variety of the Paradise Apple, called also Split Apple, but I fail to see the utility of it except that it produces few suckers, for though it aids the nur-

seryman to turn out trees of a saleable size rapidly, such trees in many cases are sacrificed eventually by the scion—or bud growing more rapidly than the stock, causing a club-like protuberance at the point of junction, and not infrequently the final severance of the scion from its stock.

The Crab stock, on the other hand, induces free strong growth from either bud or graft, and this growth is generally sappy and does not ripen, so the production of fruit-buds is rare, while the growth is in every way adapted to form the erect columnar bole or stem of the future Apple-tree; therefore this is the stock for standard trees to plant in orchards. Such trees sold by nurserymen are from three to five years old, and are stopped, as it is called, at about 5½ to 6 feet from the ground line, as soon as they are high enough, causing them to throw out lateral branches at the top, and so forming the young tree. The training of pyramidal, bush, and espalier or cordon trees is a much more complicated affair, but it is not the intention of these articles to deal with this. *Experience.*

(To be continued.)

## DAFFODILS AT BROOKFIELD, HATHERSAGE.

THE residence of G. H. Cammell, Esq., J.P., lies in a valley, surrounded by beautiful scenery, for which this part of Derbyshire is celebrated. A drive a mile or so in length connects the house with the village of Hathersage. I had the pleasure of visiting these gardens on April 22, my object being to see in flower the Narcissi, which are so numerous here, but especially to see the effect made by those which have been planted in the grass, upon the lawn, and elsewhere. I may now say that in no garden have I seen such a delightful effect made with Daffodils as I saw at Brookfield. The bulbs are planted in large numbers on the outskirts of the lawn in an informal manner. I noticed a charming effect made by a number that had been planted around a large Yew seven years ago. In a rock garden, near to the stem of a big Pine, was a mass of flower of that lovely variety Queen of Spain, the colour of which is so effective. So lovely are Daffodils when grown in the grass, that the system should be much more generally practised. Mr. Cammell says that the bulbs should be placed beneath the cuts made in raising the turf, as he has noticed that when this precaution is not taken, the bulbs lie dormant. This might easily be obviated by pulling the sods to pieces, and then laying them down. Mr. Cammell also says that the bulbs take three years to become established; the first season after planting they bloom well, the second season only poorly, but the third year they become established, and will then last for a century.

The flowers of Daffodils grown in the grass are not perhaps quite so large as those obtained from beds or borders, but size does not constitute beauty in a Narcissus flower. In the kitchen garden at Brookfield, a large number of choice varieties is grown in a border beneath a wall. These were producing as fine a lot of flowers as it is possible to see. Manure is not withheld from them in the least. I believe a quantity is worked into the soil some time previous to planting, and a good coating is applied as a mulch also.

Mr. Cammell has raised a quantity of seedlings, one or two of which, at the time of my visit, appeared to have merit, but the good points in a Narcissus hybrid do not show themselves the first season of blooming. There are many other choice hardy plants in these gardens, amongst which might be mentioned a variety of *Alstromeria aurantiaca*, which received an Award of Merit from the Royal Horticultural Society in 1893. Mr. Cammell also holds a Medal from the same Society for a collection of Daffodils. *Aster diplosiphoides*, a beautiful Himalayan species, very difficult of cultivation in many gardens, grows here in luxuriance.

Near the back portion of the house, is a pretty wild garden, through which the Hoodbrook (of Robin Hood fame) flows. Here were Aconites, Delphiniums, Peonies, and many other plants growing with great vigour. This garden is a fine addition to the place. Both Mrs. and Mr. Cammell have a great love for hardy flowers, so that my visit was a most pleasant and interesting one. *W. Harvey.*

### THE ORCHID HOUSE AT WEXHAM PARK, SLOUGH.

We have often afforded our readers views of houses in which Orchids are grouped when these have presented some especial commendable feature, or visible evidences of superior culture. In the present illustration (fig. 100) of the house in Sir Charles Pigott's garden, which was taken in the past winter, there are representations of fine plants of *Coelogyne cristata*—one with 400 blooms, *Cypripediums*, *Cattleyas*, &c.

seventy-nine stocks of Turnips, which again it may be desirable to repeat largely in the autumn. What is determined in reference to these vegetables may, in these double trials, suffice for several years, as novelties do not come very frequently. Beets, again, number no less than eighty stocks, and, no doubt, comprise most well-known varieties. Happily these too, do not come in novelty form frequently, so that the one trial may settle the proper classification and nomenclature of these roots for some time. Of Peas, of which there is a present prospect of a good trial, there are sixty-four assumed diverse, though happily

their way to Chiswick. Very likely some raisers are unselfish enough to believe that their putting their novelties into prominence may benefit humanity; but there must always be just a mild suspicion that if got into commerce as well, the pocket may be benefited. There is one special word of commendation, however, in relation to Tomatos at Chiswick, that must not be withheld. They have in the past invariably been grown in first-class form, and in that form have elicited from the committee warm approval; and there can be no doubt, in so important a garden cultural practice bids fair to be con-

FIG. 100.—THE ORCHID HOUSE IN SIR CHARLES PIGOTT'S GARDEN, WEXHAM PARK, SLOUGH.

### HOME CORRESPONDENCE.

**VEGETABLE TRIALS AT CHISWICK.**—Judging by what is being prepared by sowings at Chiswick, there is every prospect that the services of the Fruit and Vegetable Committee of the Royal Horticultural Society will be in considerable request during the ensuing season. There is being specially conducted a large trial of Strawberries, the success of which is entirely dependent on the weather, which at this moment is none too favourable, though that may soon improve. There have been sown thirty-four stocks, not all necessarily dissimilar, of Spinach, and as the plants are well forward, the product may be ready with the Strawberries. It is proposed to repeat this trial of Spinach in the autumn. There, just coming through, though, too, needing rain, is a trial of some

not all new varieties. But Peas increase rapidly, far too much so, and we could willingly do with what we have for a few years at least. The same may be said of Potatos, of which seventy-four assumed diverse varieties have been planted, for there are of so called novelties ever legion. These tubers are now such a drug in the market that a little rest in variety production would do no harm. Lastly come the Tomatos, of which again there are great numbers growing in pots, and in fine condition. The committee may well believe that, if capable of solving the great Tomato problem satisfactorily, and it yearly becomes a more arduous task, then will that body have succeeded in crossing its *pons asinorum*. But raisers of these products are in myriads, for every one who grows them is more or less a raiser, and seems always to hold that something he has is better than the general, hence so many so-called new varieties find

tionous, and that Tomatos will this summer be found in the highest excellence. Even what has been here enumerated may not constitute all the interesting subjects likely to attract the committee's attention. To ensure now the needful relatively large attendance of eleven members, to enable full awards to be made to meritorious subjects, it is desirable henceforth that as long notices of the Chiswick meetings as is possible should be given. Of course, it is difficult to say long beforehand when certain crops may be at their best; but from seven to ten days' notice at least may be found possible. Chiswick is emphatically at present the national trial-ground, where everything in the shape of trade interest or bias is kept outside. It may not be all that can be wished for, but it is generally a long way better than some will admit. The ensuing season bids fair to add to its usefulness. A. D.

**APPLE ANNIE ELIZABETH.**—This variety at Conington is a splendid cropper, and last season there were gathered from one tree, and that not a large one, nearly 40 stones of good sound fruit, and this after the rough winds had blown off a good many. Many of the fruits were more than 1 lb. in weight, and most were of splendid colour. It is an Apple not to be beaten for long keeping. The other trees of this variety were well cropped, and they have been so for several seasons in succession, although the soil of the garden is not considered to be good for fruit, being near the fens. *A. G. Galland, Conington Castle Gardens.*

**THE ROYAL HORTICULTURAL SOCIETY'S CODE OF JUDGING.**—On p. 590 "A. D." says, "No doubt it is to some an amusing (?) occupation to poke a dog with a long stick, in the hope of arousing his anger, but if the animal is dignified and cool of temper, he refuses to be drawn." Adding, "it is very much so with the members of the committee!" I may say, on the contrary, the "dignified and cool-tempered" animal referred to would certainly resent the treatment described by "A. D.," while a dog of an opposite description would probably refuse to be "drawn," i.e., to defend his position. But to come to the point. That portion of the numerous readers of the *Gardeners' Chronicle* who annually attend the exhibitions as exhibitors or judges, have a right to expect and receive answers to the points raised by our correspondent in the *Gard. Chron.* of April 4, p. 436, from "A. D." or his co-members of the Code of Judging committee. What exhibiting and judging horticulturists would like to elicit an opinion from members of the code of judging committee upon the positions of the four collections, two of fruit and two of vegetables, which appear in parallel columns at p. 436, and which, according to the Royal Horticultural Society's code of judging, are respectively adjudged of equal merit. What we require and are entitled to expect is an expression of approval or disapproval from some prominent member of the committee—"A. D." or somebody who may be able and willing to give the desired information before the summer shows are upon us. *Hortus.*

**SUMNER'S STEAM LAWN-MOWER.**—Some gardeners seem to think steam lawn-mowers should not be tolerated on any private place. I think if they were to see one of Sumner's patent steam lawn-mowers at work they would soon ask their employer's permission to buy one. I have a 25-inch machine at work here, and I am thoroughly satisfied with it. After steam is got up, there is no visible smoke and very little steam; just a little is seen escaping from the safety-valve, and it makes no more noise than a hand lawn-mower. It travels at about 4 miles an hour, is easily turned, and can be stopped instantly when required. Horses take no more notice of it than they do of a hand-mower. We find, as a rule, that it takes twelve minutes to get up steam. Being of a good weight it rolls the lawn, making the turf much smoother than when a horse or hand-machine is used. Should any gardener wish to see the steam-mower at work, I shall be pleased to show it at work at any time. *Jas. Hamilton, Eyckley Gardens, Burton-on-Trent.*

**SELF-PROPELLED LAWN-MOWERS.**—It is plain from the letters which have appeared in these pages from time to time lately, that considerable misapprehension exists as to what a self-propelled lawn-mower really is. The one most likely to come into use is not a steam-machine at all. The flame of a petroleum lamp suffices to start the motor, which afterwards works automatically; no smoke, no steam, no "ciuderheaps" are connected with its working. It is not intended for use on lawns where ordinary small machines are sufficient, but on those of large extent, where its efficiency and economy would be shown to great advantage. Having myself examined and driven one, I can say that the objections raised against the use of this kind of lawn-mower and roller are without foundation. *G. Don, Hawkhurst.*

**BERRIED AUCUBAS.**—It is just possible, that arising from the fine weather which prevailed at the blooming time last spring, pollen from male plants was unusually abundant and volatile, and that in consequence female flowers were set in such great profusion. Most persons have observed the wonderful abundance of berries seen on bushes this season, and to many not familiar with the fruit-producing properties of the Aucuba, their berry productiveness has come as a revelation. No doubt as a result we shall see male plants far more widely dispersed than hitherto. Still, we may not ignore the fact that very

fine springs have much to do with this free setting of bloom and consequent berry production. Then we have also to thank the very mild winter that has just passed, for had severe weather been experienced and birds hard driven for food, doubtless most of these beautiful berries would have disappeared long since [but do birds eat these berries? Ed.]. With the female bushes carrying such heavy crops now, is there not a probability that the strain thus created by the great fruit crop will lead to comparative barrenness next season? Shrubs of this sort can hardly have more of stamina than ordinary fruit trees that rarely carry heavy crops of fruit two years in succession. But there is yet another thing in relation to Aucubas that may well make us ask whether this abundant fruiting, beautiful as it is, may be an unalloyed good. We have long enjoyed the Aucuba as a luxuriant-growing and very handsome decorative shrub. Can young ones that expend their energies in frequent berry production ever develop into such fine specimens as the earlier ones did prior to the introduction of the male variety? So far this heavy fruiting seems to be starving the female shrubs. What may be others' experience? *A. D.*

**THE SALERNIAN SCHOOL OF MEDICINE.**—Mr. Hemsley, in his interesting article on the book entitled *De Conservanda Bona Valitudine Opusculum Scholæ Salernitanæ ad Regem Angliæ* (*Gardeners' Chronicle*, May 9, p. 579), says that, according to Meyer, the first edition was published in 1545; but the Marchese Hanbury lately put in my hands a small volume dated 1506. This contained the *Regimen Sanitatis Salerni*, and also the *De Herbarum Viribus* of Macer Floridus. The former of these works consists of 350 lines, divided into sections with commentaries thereon. It ends with a reference to Galeu's work on bleeding.\* It has no illustrations. The latter work begins as follows:—"Herbarum varias quivis cognoscere vires, Macerated, discis, quoduce, doctus eris. Macer Floridus, de Viribus herbarum. Hic suo libello dat initium." Macer Floridus wrote his book in the twelfth century (1140); the *editio princeps* was printed at Naples in 1487. The volume I had the opportunity of examining through the kindness of the Marchese Hanbury is illustrated with several woodcuts, very crude, as may be imagined; and as leaves were often considered of more importance than flowers, the resemblance to that of the real plant is often vague.† The illustrations, as stated, are confined to Macer Floridus' work, but cannot always be trusted, even when they bear an undoubted resemblance to some particular plant. Thus, *Cyperus* is illustrated by *Calendula*; *Nepta* (recognised as *Nepeta cataria*) is represented by a thick rhizome with ensiform leaves, without flowers, but evidently an *Iris*. The figure of *Eleborus albus* is that of the Solomon's Seal; while that of *E. niger* has three spikes from a common base, thickly covered with subulate bracts, and terminated by a bud. *Salvia* is represented by a bough bearing stipulate leaves. *Satureia* in Greek *Timbra* (Thymbra, L.), is interesting, being represented as branching above; it has narrow, opposite leaves, with buds in their axils. Now, according to the learned Jewish rabbins, it was a requisite that the "hyssop" used in their ceremonies should carry three branches; and this appears to be a habit of Thymbra. This plant has, therefore, been recognised as the true Hyssop of Scripture. *Ysopus* and *Menta* are also figured as single stems with opposite leaves. Macer Floridus gives the derivation of the names in some cases; thus of *Apium* he adds:—

"Est Apium dictum, quod apex hauc ferre solebat  
Victoris veterum, fieret dum more triumphii.  
Ipse sibi talem prior imposuisse coronam  
Dicitur Alcides, morum tenuisse sequentes."

*Arthemisia*, he tells us, is so called because Diana first discovered the use, and it became especially useful in the diseases of women. *Lolium* (pre-

\* Some pages of a MS. volume in my possession, of the fourteenth century, also treats of the same subject, beginning as follows:—"Here techith Galien, the goudic leche, of metze and dryke and tyme of bleding."

† This is one cause of the confusion of names in old herbars. Thus, e.g., "Chickweede" was given to members of other orders besides *Caryophyllæ*: Under *Albine*, Gerard figures species of the modern genus, *Stellaria*, *Silene*, *Albine*, *Lanium*, *Veronica*, and *Anagallis tenella*. This last links "Albine" with "Pimpernell," under which he figures *Anagallis arvensis* and *cœrulea*, as well as *Lysimachia nemorum*; while *Water Pimpernell* is represented by *Veronica Beccabunga* and *V. Anagallis*. Now, all these agree in having opposite leaves—i.e., they are all "Pimpernells," a word derived from bi-pinella, from bi-pennis, or "double-winged." Tracing the history, we find it said, "Ipsi major is pimpernell" *Aggregator Practicus de Simplicibus*, circ. 1480. "Chickweede" in Latin *Albine*, of some of the ancients is called *Hippia*. (*Ger. Herb.*, p. 491, A. B., 1567). Hence results the combination of names.

sumably "Darnel") is recorded as being used for the same purposes as "Ergot" is now; hence, the probable origin of the poisonous character of this grass is traceable to an ergotised condition—perhaps that of the "sphacelia" stage, before the "ergot" is manifest. *George Henslow.*

**FEEDING ASPARAGUS; THE AGE OF BEDS.**—I have been very much interested in reading the notes on Asparagus feeding, by Mr. Wythes and "D. T. F.," in the last two numbers of the *Gardeners' Chronicle*, and would be pleased to read an article by "D. T. F.," on the treatment of Asparagus beds reputed to be 50 years old. There are in these gardens two beds each measuring 45 by 5 feet, which are said to be 100 years old, which annually produce heavy crops of very good heads. We have also two other beds known to be forty years old, which give equally good results. All of these beds are planted on the flat, the ground being perfectly level; and they are so situated that the sun scarcely strikes them during the winter, being bounded by a range of sheds and stabling on the south side. The beds run north-west to south-east. The soil is of an open sandy nature, 5 feet deep, with a gravelly subsoil, so that moisture drains quickly away. My practice is to lightly fork over the surface of the beds in the early spring before growth commences. As soon as the heads show well above the ground, I apply a dressing of salt, sufficient to whiten the surface, the same being several times repeated during the growing season. I occasionally deluge the beds with liquid-manure from a tank in the cow-yard, during summer and early autumn. As soon as cutting is stopped, a mulching of decayed farm-yard manure is applied, the remains of which are raked off when the stems are cut down in the autumn. The soil of the garden seems to suit Asparagus; and when I took charge of these gardens, strong seedling plants were scattered throughout the kitchen-garden. If any of the numerous readers of the *Gardeners' Chronicle* have tried the effect of dressings of nitrate of soda on Asparagus, will they kindly publish the results in these columns. *Robert Turnbull, Beachley Gardens, Chepstow.*

## SOCIETIES.

### ROYAL HORTICULTURAL Scientific Committee.

MAY 5.—*Present*: Dr. M. T. Masters (in the chair); Mr. McLachlan, Mr. Michael, Rev. W. Wilks, Mr. Douglas, Dr. Miller, Dr. Russell, Rev. G. H. Englehart, Rev. G. Henslow (Hoc. Sec.), and Prof. Zacharias, Director of the Botanic Garden, Hamburg (visitor).

*Primula auricula* × *Alpine var.*—Dr. Masters reported upon the two abnormal specimens brought to the last meeting occurring among the seedling hybrids raised by Mr. Douglas. One had foliaceous flowers, the corolla, &c., being represented by minute green leaves. In the other the corolla-tube, as if from some check to growth, was only abnormally bent.

*Bardfield Oxlip.*—With reference to the statement by Mr. French that this species resisted being crossed by the Cowslip or Primrose, Mr. C. Wolley Dod sent specimens from his garden to show that there was reason to suppose that they were the result of the Bardfield Oxlip having been crossed by the Primrose. The foliage sent, however, agreed almost entirely with that of the Oxlip type, and in one kind only of the flowers was there a slight tendency to produce the inflated calyx tube and the crest or corona within the corolla tube, characteristic of *Pitarosces* and Cowslips, the total absence of this being a marked feature of the Oxlip.

*Raspberry-stem Borc.*—Mr. McLachlan remarked on a specimen sent by Mr. Pearson of Chilwell, that the injury resulted in the destruction of the buds, the eggs being hatched in the flower; but that it was difficult to suggest a remedy. Cart-grease smeared round the base of the canes, or kerosine emulsion washed round the stems, has been suggested as preventives. The grub was that of *Lampronia rubicula*, a small moth. It formed the prey of tomites.

*Primula auricula* ×.—Mr. Douglas exhibited plants of crosses between *Primula pubescens* (the pod-bearer) and an *Alpine Auricula*, and remarked upon the perseverance of humble-bees in visiting the *Auricula*; within a quarter of an hour he had observed that a bee visited 508 flowers, thus giving two seconds apiece, on the average, to each.

*Cineraria*, *Origin of*.—Mr. Douglas also exhibited several sprays of different shades of mauve, from seedlings raised from the plant at Kew of *Cineraria cruenta*. He called attention to the original illustration of this species, and of *C. lanata*, in the *Botanical Magazine*, and considered that the probabilities were in favour of *C. lanata*, or else a cross with this species being the source of the cultivated forms.

*Colouring of Flowers.*—Dr. Russell gave some details of a preliminary experiment with white Hyacinths, treated with various salts, to test the influence they might have upon the colouring of the flowers. The only bulbs obtainable were, unfortunately, very inferior in quality, as the experiment

was not proposed till too late in the season. On March 6 the bulbs were treated with the following solutions, all being grown in water:—Cobalt nitrate, copper sulphate, ferrous sulphate, manganese nitrate, nickel nitrate, chromium acetate, zinc nitrate, ammonium nitrate, urea, soluble Prussian blue, colli, and water alone distilled. All contained 15 grains to a pint of distilled water. As the liquids evaporated they were made up with a stronger solution of 50 grains to the pint. Two plants only indicated any colour in the flowers. The one treated with nickel nitrate on March 25 looked very bad, limp and yellow; the bud, which would naturally have been green, showed a distinctly pink colour. The one treated with ferrous sulphate blossomed, and had also a decidedly pink tinge. All the rest were either more or less arrested in growth, sickly or dead. As a preliminary experiment, and that with unsatisfactory materials, the result, so far as the above two were concerned, was interesting; but it was the general opinion that the solutions were too strong, and that this would probably account for the injurious effects upon the growth of the Hyacinths. It is proposed to try further experiments with white Pelargoniums.

*Narcissus, Crosses.*—Mr. Engleheart, in describing the various results of his experience in crossing the Narcissus during the last fifteen years, observed that the main cross was between the Trumpet Narcissi (as pod bearers) and *N. Poeticus*. This gave rise to the *Incomparabilis* section; but among the seedlings of the cross there would sometimes arise pure Poetics; the male was always more or less prepotent, but sometimes the offspring would show no trace of the female parent. Dr. Masters observed that the same result sometimes occurred in other plants. Dr. Zacharias alluded to the case of Strawberries ("False Crosses," *Gard. Chron.*, 1894, p. 568); and Mr. Henslow mentioned that when the *Rhododendron* "Monarch" (which contained the species *R. jasminiflorum*, twice, *R. javanicum*, *R. Lobbi*, and *R. Brookeanum* var. *gracile*) was crossed with *R. malayanum*, the result was almost pure *malayanum*.

*Larch Disease.*—Dr. Masters exhibited a specimen showing the fungus *Peziza Wilkommii* in the fruiting stage. It has attacked the stem to such an extent, that the whole of the wood has grown excentrically.

*Abies emabalis*.—He also exhibited a fine spray of this tree laden with many male catkins of a brilliant red and yellow colour. This had been previously described, from imperfect specimens, as bearing single catkins only.

## ROYAL BOTANIC.

MAY 13.—The annual summer exhibition of the Royal Botanic Society was held on Wednesday last in the gardens of the society at Regent's Park. It is with regret that we have to notice a continued decrease in the number of competitive exhibits at this show, and also that those of an honorary character do not compensate fully for such deficiencies. This state of things has been increasingly apparent for some years, but, on the occasion under notice, the whole of the specimen stove and greenhouse plants that have been associated with this society's exhibitions for so many years were absent. There is now no exhibition in London during the year at which plants of such a nature can be seen. The competitive exhibits on Wednesday last were included in about half-a-dozen classes. Yet the site is about the most suitable one for an exhibition that could be obtained anywhere.

Honorary exhibits were numerous, and many of them were of a first-rate character. A superb exhibit of cut Roses was made by Mr. Geo. Mount, The Rose Nurseries, Canterbury, which included large boxes full of each of the varieties Ulrich Brunner, La France, Capt. Hayward, Niphotos, and Mrs. Jno. Laing, all being very beautiful, in good condition and colour. Amongst the boxes containing mixed varieties, we noticed especially good flowers of Prince Arthur, Cleopatra, Mrs. Jno. Laing, Fisher Holmes, C. messo de Nadaille, Marie Finger, and others. The blooms staged with long stems and fine foliage attached were also very effective.

Messrs. Wm. Paul & Son, Waltham Cross Nurseries, Herts, staged a magnificent group of Roses in pots. All the plants were excellent in condition and well flowered. The standard plants arranged among the dwarfs gave a very pleasing effect. The group was faced by a belt of cut Roses in boxes, all of capital merit, and pleasing freshness.

A fine display of Peonia blooms was made by Messrs. Kelway & Son, Langport, Somerset. Particularly noticeable among the varieties included in this collection were Kelway's Florizel, a large white almost single-flower, marked prettily with rose from the centre outwards; Cerites, a very deep rose, semi-double variety. Mr. Chaplin, a dark crimson, almost maroon, single-flowered; Proslate, a rose-coloured double; and others equally good. A number of Hippocastanum flowers in boxes, singly, without the scape, created a poor show; but there were numerous varieties of Iris flowers, some fine sprays of Cannas, Lupins, Aquilegias, Pyrethrum roseum, and other flowers, which together made a very large collection.

Herbaceous Calceolarias were shown by Mr. Stuart, gr. to N. L. Cones, Esq., Englefield Green, and he had a very commendable group, the plants representing a good strain.

Messrs. Barr & Son, 12 and 13, King Street, Covent Garden, contributed a collection of hardy flowers, the principal constituents of which were the numerous Tulips. Many of the late-flowering section were very well shown

but the collection was especially rich in a class which has been termed English Tulips, consisting of varieties raised by the Lancashire growers during the last half century. The flowers are striped, like the old-fashioned Tulips, but the petals are less elongated, and more round at the apex. The base of most of them has been cleared in colour also.

Mr. P. Porty, gr. to J. C. Tasker, Esq., Middleton Hall, Brentwood, was the exhibitor of a group of Cannas in considerable variety. The plants were well grown, and the group had a good appearance.

An exhibit of new and rare plants from Messrs. Jas. Veitch & Sons, Royal Exotic Nursery, Chelsea, contained *Richardia Elliottiana* in flower, the new *Maranta* major, *Phyllocactus Venus*, a very showy variety; also *P. inthe*, a less showy, but pretty rose-flesh coloured variety. Several of the dwarf, small-leaved species of *Caladiums* sent out last year, including the varieties *F. W. Moore*, *Tennyson*, *Ladas*, *Lord Rosebery*, *Duke of York*, *Duchess of York*, and *Chelsea Gem*, all of which are small-leaved dwarf varieties. Several hybrid *Cypripediums*, some *Gloxinias*, and an ornamental *Begonia* named *B. acerifolia*, obtained from a cross between *B. Burkei* and *B. decora*.

An exhibit of *Daphne Nerium* was made by Mr. Arthur Knowles, Horsell Birch Nursery, near Woking, Surrey.

Messrs. T. F. Rivers & Son, Sawbridgeworth, exhibited about eighteen beautiful Nectarine trees in fruit, carrying an excellent crop, as is usual in the case of trees from this nursery. A number of gathered fruits and all of the Nectarine trees represented the new variety, Cardinal, which is said to ripen ten days earlier than Early Rivers, and is recommended as an early forcing variety. The fruit is of good size, with melting flesh, and a particularly refined flavour.

Mr. Scott exhibited a group of miscellaneous plants of ordinary species.

A group of hardy *Rhododendrons* in flower, contributed by Messrs. Jno. Waterer & Sons, Bagshot, was very gay. The varieties were named ones, and such as *Jno. Waterer*, *Mrs. Jno. Penn*, *Princess of Wales*, *Concession*, *Cynthia*, and others, were very beautiful. A few varieties of Japanese Maples interspersed with the *Rhododendrons* were very effective.

Mr. Thos. S. Ware, Hale Farm Nurseries, near Tottenham, had a group of hardy plants, including *Anemone Narcissiflora*, with white flowers, several upon a stem like a *Polyanthus*. A fine pair of *Ranondia pyrenaica* in flower was shown, and the white-flowered *Habenaria dilatata*, and other plants.

## COMPETITIVE.

Orchids were only shown by Mr. Geo. Cragg, gr. to W. C. Walker, Esq., Percy Lodge, Winchmore Hill, who had a collection of twelve specimens. Among these was a large, well-flowered specimen of *Lodola purpurata*; and there were also good plants of *Cattleya Trianaei*, *Masdevallia Harryana*, *Oncidium Marshallianum*, and *Cymbidium Lowianum*, &c.

The 1st prize for six greenhouse Azaleas was taken by Mr. R. Scott, gr. to Miss Foster, The Holmes, Regent's Park, who also took a 2nd prize for a group of the same kind of plants. There was no competition in the latter case.

Mr. Thos. S. Ware staged an admirable group of hardy plants, showing good clumps of the different species, which gave a correct idea of their true character; *Lilium croceum*, and *L. Harrisii*, *Astilbes*, *Iris*, *Trollius*, *Geums*, and other things so shown, were admirable. The bright-flowered *Silene virginica*, the distinct *Dodecatheon Meadia alba*, and several species of *Orchis*, were included. Mr. Ware was also 1st for a group of twelve *Begonias*, and staged a collection worthy of much praise. Many new varieties of *Begonia* were also shown, some of which possessed considerable merit.

The 1st prize for a group of Roses was won by Mr. Wm. Rumsey, Joydings Nursery, Waltham Cross, who had a group of plants of considerable extent. These were well-flowered, and nice and fresh in appearance. The pink-flowered H.P. Mrs. Rumsey was also shown. It is a new variety, with splendid foliage, and is said to be absolutely proof against mildew. A large number of cut blooms were likewise from Mr. Rumsey. Mr. Rumsey was awarded a 2nd for a collection of nine Roses in pots.

## HERBACEOUS CALCEOLARIAS, ETC., AT HARROW WEALD HOUSE.

The showy varieties of herbaceous Calceolarias, that used to be considered indispensable in most greenhouses, have become less popular, or, at any rate, less common, in private gardens. It is seldom we see a good collection of plants of dwarf stature hidden by a multitude of flowers of as many varieties as there are plants; yet the display such a collection affords is a familiar one to most gardeners who have seen the rise and development of the tuberous *Begonias* as a greenhouse and bedding plant. Gardeners who are still acquiring their professional experience may not have seen them so often or so good. Generally, an excellent group of plants, representing the choicest strains, is exhibited at the Temple Show. A few days ago, we had the pleasure of inspecting a capital display in the gardens of G. Grinling, Esq., Harrow Weald House,

where at the present time the Calceolarias are the most attractive plants in flower. They are staged in a span-roof greenhouse, and are shaded from the hot sun in order to preserve the flowers as long as possible. It is not thus, however, that they are seen to their best advantage, and it was not until Mr. Rapley, the gardener, had caused the temporary blinds to be removed, that the full effect of the showy blossoms was manifest.

The gardener here in earlier years used to exhibit these plants, and in the collection under notice there is evidence of the same skilful treatment and care in details, that is necessary in the culture of all plants if they are to appear at their best. Most of them are in 7-inch pots, not quite so large in circumference as would be desirable were they for competitive exhibition, but sufficiently so for the purposes for which they are intended. They are dwarf, well clothed with foliage to the base, and their summit is a crown of flowers which hides the foliage as seen from above, and gives to each plant an appearance of exceptional floriferousness. As we have previously intimated, and as many of our readers know, the variations in the flowers are as multitudinous as are the plants in the collection. Some are pink, others are rose, or purple, or yellow, canary yellow, and the peculiar sulphur yellow being very distinctly represented. Then there are scarlet, and other bright colours and tints, and the whole of them are mottled, or reticulated, or spotted in ever-varying degree and variety. A plant with lemon-coloured flowers, with a few reddish spots, was one of the more beautiful; and another having purple flowers with curious markings in yellow, specially attracted attention. In addition to these, however, there are the self-coloured varieties, among which Cloth of Gold, a variety raised by Mr. Rapley, and certificated by the Royal Horticultural Society about fifteen years ago, is at once the most showy and most beautiful. The flowers of all the varieties are of capital substance, and will doubtless last a considerable time.

The reason that this section of Calceolaria is less cultivated than formerly, is probably due to the increased popularity of the *Begonia*, *Streptocarpus*, *Canna*, and other greenhouse plants we could name, and of which it is quite impossible to write except in the most favourable terms.

Nevertheless, it would appear that the Calceolaria is an excellent plant for small gardens, where the resources are not in proportion to the requirements of the owner, but probably less. The requisite cultivation is of the simplest character. A packet of seed should be obtained from the best source, because, if a good start is made, and it is the gardener's desire, he may use seed from his own plants in succeeding years, and according to his care and discernment in the selecting of such seed, so will his strain improve or deteriorate. The seed should be sown about mid-summer, or during July, in pans which have been filled with light sandy soil for the purpose. The same care that one would take if sowing *Begonia* seed should be given. Gently press the seed into the soil, and place a piece of glass over them. They may be stood in a shady place in a cool frame or a cool greenhouse, but as soon as the first leaves appear the glass must be gradually removed and the seedlings given an abundance of light, but not strong sun. The usual practice of pricking out seedlings when large enough, and keeping them in a suitable place until they are ready for 3-inch pots, should be followed. The plants will soon fill these pots with roots, and it will be then desirable to repot them into some about 5 inches in diameter, using a nice light compost such as that in which a *Fuchsia* would do well. In these pots they may remain during the winter, and the hardier they can be kept during that time the better for the plants. Any dry frost-proof frame will do, but on no account use much fire-heat—rather cover with mats in the event of frost.

Not later than the middle of February, the plants may be put into 7-inch pots (or larger if desired), and from this time they should be encouraged to make strong and sturdy growth. In the final potting nothing exceptional is needed in the compost, which may consist of fibrous loam, plenty of leaf-mould, and

a small quantity of sand. Add to this some spent Mushroom-bed manure, or better still, decayed sheep-droppings. The plants should commence to bloom about the end of April or beginning of May, and they will be a success in exactly the same proportion as the cultivator has attended to the details in the necessary culture, one of the most important items in which is to preserve the plants from the attacks of green-fly.

Reverting for a moment to the gardens already mentioned, we noticed there a nice collection of the more useful and showy Orchids. Among the plants in bloom were Dendrobium Falconeri in a very fine variety both in colour and form; and in the cool house an especially good variety of Odontoglossum nebulosum was noticed. The Orchids generally are well cultivated, and the excellent pans of Cologynes, also many of the Cattleyas, Lelias, and Calanthes are deserving of much praise. Cyclamens are well grown also, and there are numerous seedlings now growing apace. The Gloxinias are treated equally liberally, and in their season create a fine effect. Outside, the gardens and grounds are tidy and well kept, and there is a good tennis lawn. The private conservatory is a lofty structure, though of small area, and is suitable only for furnishing with Palms, Tree Ferns, and such plants. Much more pleasing and agreeable is a covered verandah on the west front, where there are Passifloras, and many other trailing and climbing plants. The dwelling-house itself is hidden almost everywhere by Jasmines and other plants, which have been encouraged to clothe it. The beauty of the gardens and grounds would have been greater had they been formed upon higher ground, the site where the house has been built being such a one that more than ordinary efforts are required in order to obtain the privacy and seclusion desirable in a country residence.

**THE PAST WEEK.**  
The following summary record of the weather throughout the British Islands for the week ending May 9, is furnished from the Meteorological Office:—

"The weather during this period was very fine and dry generally, with warm days and cold nights. Slight thunder and lightning were experienced, however, at some of the extreme southern stations on the 6th or 7th, as well as at Fort William.

"The temperature was a little below the normal in 'England, E.,' just equal to the mean over 'England, S.' and the 'Midland Counties,' but considerably in excess in the extreme north-east, north, and north-west. In 'Scotland, N.' and 'Ireland, N.' the excess was 5°, and in 'Scotland, E.' 6°. The highest of the maxima occurred during the latter part of the period, and ranged from 78° in 'Ireland, N.,' and 75° in 'Scotland, N.,' to 67° in 'England, N.E.,' and to 64° in the 'Channel Islands.' The lowest of the minima were recorded between the 3rd and 5th, when the sheltered thermometer fell to 28° both in 'England, N.E.' and 'England, S.W.,' to 29° in the 'Midland Counties,' and to between 30° and 34° in most other districts; in 'Ireland, S.,' however, the lowest reading was 35°, and that in the 'Channel Islands' 42°. Sharp ground-frosts were experienced very generally during the earlier days of the week.

"The rainfall was almost entirely absent from Great Britain, and much less than the mean in Ireland.

"The bright sunshine was very prevalent, and exceeded the mean in all districts; the percentage of the possible duration ranged from 69 in the 'Channel Islands,' and 68 in 'England, S.W.,' to 51 in 'England, E.,' and 47 in 'Ireland, N.'"

**SEEDS.**

LONDON: May 13.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., state that the present harmful and prolonged drought naturally stops sowing orders for seeds. Meantime, however, Clover and Trefoil seeds are receiving a considerable amount of attention from speculative buyers, and the opinion is largely held that the present low range of value, combined with poor crop prospects, offers attractive temptations for holding over. The trade for Tares continues slow. As regards Birdseeds there is no fresh feature. Peas and Haricots are held for more money. Holders of Pulse maintain that this dry weather must presently result in a scarcity of green vegetables. Buckwheat is 1s. higher. There is no alteration in either Mustard or Rapeseed.

**MARKETS.**

**COVENT GARDEN, MAY 14.**

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

10, Ireland, S.; \* Channel Islands.

**POTATOS.**

BOROUGH: May 12. Quotations for Old ranged from 30s. to 8s. per ton; and for New were from 1s. 6d. to 16s. per cwt.

SPITALFIELDS: May 12.—Quotations:—Old: Highlands, Bruce, 35s. to 50s.; Drones, 40s. to 50s.; Magnums, 35s. to 45s.; Blacklands, 20s. to 30s.; Scotch Bruce, 35s. to 50s.; Main Crop, 40s. to 55s.; Dunbars, 60s. to 75s. New: Jersey Kidneys, 10s. 6d. to 12s. per cwt.; Lisbons, 6s. to 7s. do.; Canary, 7s. to 8s. 6d. do.; Egypt, 8s. to 9s. do.

STRATFORD: May 12.—Quotations:—Dark soil, Bruces, 18s. to 20s.; light do., 20s. to 50s.; Reading Giants, 30s. to 50s.; Sutton's Abundance, 40s. to 60s.; Scotch Main Crop, 50s. to 70s.; Dunbar Magnums, 60s. to 80s. per ton.

FARRINGTON: May 14.—Quotations:—New: Jersey Flukes, 12s. to 18s.; Kidneys, 11s. to 12s. per cwt.; Old, 30s. to 70s. per ton.

LONDON AVERAGES: May 13.—Quotations:—New: Jersey, 12s. to 14s.; Guernsey, 12s. to 14s.; Maltesa, 8s. to 9s.; Lisbon, 6s. to 7s. per cwt. Old: Dunbar Main Crop, 65s. to 80s.; do. Bruce, 70s. to 80s.; English Main Crop, 45s. to 65s.; Imperateurs, 40s. to 90s.; Magnums, 30s. to 40s. per ton.

**CORN.**

Average.—Official statement of the average prices of British Corn, imperial measure (pr.) for the week ending May 9, and for the corresponding period last year:—1895: Wheat, 25s. 7d.; Barley, 21s.; Oats, 14s. 4d. 1896: Wheat, 22s. 4d.; Barley, 21s. 5d.; and Oats, 13s. 6d.

**CALCEOLARIA:** A. F. The general habit of your Calceolaria is strong and robust, and in the specimens sent we find no trace of organic disease. There must be some external cause for going off which we cannot determine from the portions sent. As we cannot guess the cause, we cannot suggest a remedy. M. C. C.

**CALCEOLARIAS ADVERTISED:** J. H. S. You should consult your solicitor.

**CUCUMBERS:** C. D. Kindly send specimens of stem, leaves, and fruits, for our inspection. Common garden soil is scarcely suitable. Use loam and rotten dung.

**FASCINATION:** Chose, W. M. Very common in Asparagus, less so in Ranunculus acris and Narcissus.

**INSECT ON WILLOWS:** Willow. The larvae on the Willow appear to be those of the Winter Moth (*Cheimatobia brumata*) so destructive to Apples, &c., but which will feed on almost any kind of tree. The remedies recommended in the case of fruit trees should answer equally well on Willow. If petroleum emulsion has failed try Paris Green [poison], the cost of which per acre we do not know. If the Willows are standards or pollards it would be well to use grease hands round the stems, near the ground in late autumn to catch the newly-emerged females, but this would hardly be practicable if they are ground ozers. R. M. L.

**MALFORMED NETTLE:** T. T. The distortion is caused by a fungus, *Aecidium Urticeae*, the yellow cups of which are beautifully developed. When spores of this same fungus are grown on *Carex hirta*, they assume a totally different character, which before the two forms were proved to be of the same species, was named *Puccinia caricis*.

**NAMES OF PLANTS:** Correspondents not answered in this issue are requested to be so good as to consult the following number.—A. B. C. *Amelanchier canadensis* (Snowy Mespilus).—W. O. 1, *Dendrobium capillipes*; 2, *D. Parishii*; 3, *Epidendrum Ottonis*; 4, approaches *Dendrobium nobile nobiliss*, but does not appear to be the right thing. Weakness of plant, or some accident in culture, however, may make the difference.—H. E. D. 1, *Cupressus Lawsoniana*; 2, *Thuja orientalis* var.; 3, you must have made a mistake. It is not likely this bears a white berry. Send again.—J. M.—*Amelanchier canadensis*.—F. Thompson. *Philodendron crassinervium*.—Constant Reader. *Antennaria margaritacea*.—Mells 1, *Berberis empetrifolia*; 2, the same, with double flowers; 3, *Piptanthus nepalensis*; 4, *Rubus roseifolius*.—A. J. K. *Diplacus glutinosus*.—J. G. Ordinary *Cattleya Mossiae*, of good size.—J. P. 1, *Weigela rosea* var.; 2, *Euonymus japonicus*, variegated form; 3, *Kerria japonica*; 4, *Dendrobium chrysanthum*.—E. F. 1, *Euphorbia pilosa*; 2, *Lychnis dioica*, double-fl.; 3, *Geranium pratense*; 4, *Centaurea montana alba*; 5, *Phlomis lanata*.—W. & B. *Holcus mollis*.—J. G. *Prunus Padus*. Such communications should be sent to the Editor, not to the Publisher.—W. R. *Pyrus intermedia*.—W. D. You are unreasonable in your demands on our time. Another time do not send more than six. 1, *Toxicophlaca spectabilis*; 2, *Adonis vernalis*; 3, *Gentiana lutea*; 4, *Veronica gentianoides*; 5, *Ornithogalum umbellatum*; 6, *Iberis corneifolia*; 7, *Scilla peruviana*; 8, *Asphodelus luteus*; 9, *A. Salvia*, not in flower; 10, *Centaurea montana*; 11, the same, white var.; 12, *Pulmonaria officinalis*; 13, *Phlox subulata*; 14, *Oxalis Bowiei*; 15, *Aubrietia deltoidea*; 16, *Gnaphalium* or *Antennaria margaritacea*; 17, *Euphorbia Lathyris* (Caper-Spurge); 18, not recognised.—Y. C. 1, *Muscari*, not recognised; 2, *M. comosum monstrosum*; 3, *M. comosum*.—Chose. *Dendrobium Devonianum*.—E. C. L. 3, *Crossandra undulata*.—H. *Akebia quinata*.—A. B. 1, *Paulownia imperialis*; 2, *Ceanothus azureus*; *Cattleya* roots not found.—J. C. 1, *Euonymus japonicus*; 2, *Podocarpus andina*; 3, *Smilax aspera*; 4, *Cassinia fulvida*; 5, *Kerria japonica variegata*.—H. H. D. 1, *Saxifraga (Megasea) cordifolia*; 2, *Caragana arborescens var. incernis*; 3, *Scilla campanulata*; 4, *Saxifraga (Megasea) crassifolia*; 5, *Euphorbia myrsinites*; 6 and 7, next week.

**NARCISSUS FASCIATED:** W. M. Many thanks; not uncommon.

**PEAR MARIE LOUISE:** J. A. B. The first cause of disease in the Pear trees is the common scab-mould, which affects the leaves and branches. On the dead twigs are other fungi, such as *Dothiora*, but these only attack the dead tissues. The destructive pest is the *Fusicladium pyrorum*, and this is common wherever Pear and Apple trees are cultivated. M. C. C.

**ROSE:** H. W. We cannot tell from a single bloom; perhaps it is W. A. Richardson.

**ROSES AT BACK OF VINERY:** C. D. Put the Roses in a position where they will obtain the fullest amount of sunlight; or let them run up to the top of the vinery, and spread out sideways, unimpeded by the Vines. The Roses get too much shade where they are.

**SCALE ON SHOOTS OF THE VINE:** Essex Hall. The insects sent are splendid specimens of a white woolly scale, allied to that which sometimes causes great havoc in plantations of Currants (*Pulvinaria ribesiae*), and known under the name of *P. vitis*. The woolly web contains numberless eggs, which hatch out in the web, becoming whitish or orange-coloured larvae. At this season, the only remedy which could be adopted would be to touch the scale with methylated spirits. In the autumn, white-washing the Vines with thick whitewash, to smother the insects, and after the lapse of a month removing this with water, and dressing with petroleum emulsion, or petroleum and soft-soap, according to the formula given on p. 589, in last week's issue, as against insects which suck. All infested shoots which can be removed should be burned.

**SCIENTIFIC GARDENING:** W. G. You should place the youth in a good botanical garden, or in an extensive nursery. He might then go to some big private gardens for several years.

**SPLIT CUCUMBER STEM:** C. B. & Co. The result of unequal growth, due probably to excess of food, and, perhaps, of water. You might mound up the stem with sandy loam, and thus get roots out of the former above the rupture.

**STRAWBERRIES ATTACKED BY OIDIUM SPS.** J. Geary. The white mould on Strawberries resembles the mildew of Turnips, *Oidium Balsami*, and has been called by the same name, but it is probably a distinct species. "The fungus makes its first attack on the leaves, and then speedily invades with increased vigour the flowers and footstalks, ultimately inducing the scorched appearance so well known in connection with the *Oidium* of the Vine." We can only suggest sulphur as a remedy, or anything which may have been found useful in checking the Vine disease. It is at first a superficial, or epiphytall mould, and as such is amenable to treatment, if it is taken in time. M. C. C.

**TARRED STAGING IN GREENHOUSE:** A. E. H. You will have to clear out the staging, or no plant will remain in health in the house.

**TULIP AND LILY:** G. E. Your Lilies and Tulips are evidently attacked by a fungus disease, and we have found no fruit in the specimens sent. It can only be suspected that the mould which causes the mischief is *Ovularia elliptica* (*Gardeners' Chronicle*, September 10, 1881). We can only suggest spraying with a copper solution. The disease will spread from plant to plant, unless checked or rooted out. M. C. C.

**COMMUNICATIONS RECEIVED.**—C. Y. M.—E.—W. D.—W. B.—W. C., next week. —R. A.—F. K., Berlin. —A. H. K.—W. W.—American Florist Co.—R. W.—T. B.—J. L.—Dr. Mottareale, Naples.—W. H., see present issue.—G. S., Barnet.—S. C.—Rev. G. H. E.—A. P.—J. G.—A. G.—E. U.—U. Ed., Hoogeveen.—C. D.—D. R. W.—W. L. A. Y.—R. T.—D. T. F.—F. Q. C.—H. M.—J. D.—J. B.—W. P. W.—C. Y. M.—A. C. P.—R. # GREEN'S PATENT "SILENS MESSOR" AND "NEW MONARCH" ROLLING AND COLLECTING MACHINES FOR 1896.

The Winners of every Highest Prize in all cases of competition, and the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by— They are the first, foremost, and best in the world. HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions. HIS ROYAL HIGHNESS THE PRINCE OF WALES.

THE KING OF THE BELGIANS. The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA. And most of the NOBILITY, CLEROY, and GENTRY of the United Kingdom.

And most of the Horse Lawn Mowers having been in use here for upwards of thirty years; but combined with good workmanship is the further important recommendation that they are of very light and easy draught.

And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others. Upwards of 220,000 of these Machines have been Sold since they were first introduced in the year 1856.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given. The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

## SINGLE-HANDED SILENS MESSOR LAWN MOWER.

- With Improved Steel Chains, Wheels, and Handles.
- To cut 6 in., can be worked by a Lady ... £1 15 0
  - To cut 8 in., do. ... 2 10 0
  - To cut 10 in., do. by a strong youth ... 3 10 0
  - To cut 12 in., do. by a man ... 4 10 0
  - To cut 14 in., do. do. ... 5 10 0

We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.

BEWARE OF DECEPTIVE IMITATIONS.

## DOUBLE-HANDED LAWN MOWER.

- To cut 18 inches, can be worked by one man } £8 10 0
  - To cut 22 inches, can be worked by two men } £8 10 0
  - To cut 24 inches, do. do. ... 9 0 0
  - To cut 18 inches, do. man and boy ... 7 10 0
  - To cut 20 inches, do. do. ... 8 0 0
- \* If made stronger, suitable for Donkey, 30s. extra.

These Mowers are the "Ne Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.

Donkey, Pony, and Horse Machines, including Patent Self-Delivery Box, or Side Delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Olg Harness. We have dispensed with the old-fashioned method of side delivery in these machines, so that they are thoroughly up to date.

## DONKEY AND PONY MACHINES.

- To cut 26 inches ... £14 0 0
- To cut 28 inches ... 18 0 0
- To cut 30 inches ... 18 0 0
- Leather Boots for Donkey ... 1 0 0
- Leather Boots for Pony ... 1 4 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

## HORSE MACHINES.

- To cut 30 inches ... £22 0 0
- To cut 36 inches ... 26 0 0
- To cut 42 inches ... 30 0 0
- To cut 48 inches ... 34 0 0
- Leather Boots for Horse ... 1 9 0

- Large size for Clubs and Large Grounds, price 17s.

Small Bag of Marking Composition, 9d.

## Green's Patent New Monarch LIGHT DRAUGHT LAWN MOWER.

It is superior to any Mower of this class yet brought out. Very suitable for Small Lawns and Banks.

- SALE SIZES AND PRICES.
- To Cut ... 6 8 10 12 14 18 inches.
  - Without Grass Box 30s. 35s. 40s. 50s. 60s. 70s. each.
  - Grass Box extra ... 5s. 5s. 5s. 8s. 6d. 8s. 6d. 8s. 6d.
- If fitted with a Long Handle for cutting banks, &c., 5s. extra. No charge for packing-cases, except for shipment.

## GREEN'S PATENT Ordinary IRON and WATER-BALLAST ROLLERS

FOR Lawns, Drives, Bowling Greens, Cricket Fields, and Gravel Paths.

PRICES OF	wt. qr. lb.	Diam.	Length.	Reduced Prices
HAND ROLLERS.	3 0 0	18 in.	by 17 in.	£2 5 0
	5 2 0	20 in.	22 in.	3 0 0
	8 2 0	24 in.	26 in.	4 5 0
HAND ROLLERS.	6 2 0	26 in.	28 in.	5 10 0
	8 2 0	30 in.	32 in.	7 5 0

## GREEN'S IMPROVED WATER & SAND BALLAST ROLLERS.

They can have the weight regulated to suit the requirements of the ground, and also have it increased up to 45% on the empty weight of the Rollers. Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in Great Britain.

PRICES, INCLUD-	Weight-cwt. qr. lb.	Diam.	Length.	Reduced Prices
ING WATER FUNNEL.	2 1 14	18 in.	by 17 in.	£3 0 0
	3 1 0	20 in.	22 in.	4 0 0
	5 2 0	24 in.	26 in.	5 5 0
ING WATER FUNNEL.	8 2 0	28 in.	30 in.	7 0 0
	8 2 0	32 in.	33 in.	9 5 0

These Rollers possess many advantages over all others; they are made in two parts, and are free in revolving on the axis, which affords greater facility for turning, and the outer edges are rounded off or turned inwards, so that the unsightly mark left by other Rollers is avoided. They are manufactured of the best materials, bored true in the lathe, turned on the inner edges, fitted on polished shaft, and are got up in a manner surpassing any hitherto brought out.

## GREEN'S IMPROVED PATENT GRASS EDGE CLIPPER. THE "HANDY."

The work it does is clean, neat, and effective, and we have every confidence in recommending this useful "Handy" implement.

Price, 30s.

Carriage paid to all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

The largest stock of Mowers kept by any manufacturer is to be found at our London Establishment, SURREY WORKS, BLACKFRIARS ROAD, where Purchasers can make selection out of several hundred Machines of Hand, Pony, and Horse Power, and have their Orders supplied the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, Free of Cost to the Purchaser.

N.B.—Those who have Lawn Mowers which need repairing should send them either through their Ironmonger or Seedsman to our Leeds or London Establishment, or direct to us, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

GARDEN SEATS AND CHAIRS, AND HORTICULTURAL IMPLEMENTS OF EVERY DESCRIPTION, WIRE NETTING, &c., &c. Descriptive Illustrated PRICE LISTS Free on application to

**NOTICE.**—The American Plants at Knapp Hill are now in bloom, and may be seen daily, *Sundays excepted.*

The Rhododendrons and Azaleas in Botton Row are from Knapp Hill. **ANTHONY WATERER, Knapp Hill Nursery, Woking, Surrey.**

**ARUM LILIES.**—300 very fine Plants out of 8-inch pots. £3 per 100. **J. WOODS, West Derby, Liverpool.**

### Sow Now.

**SUTTON'S PERFECTION CALCEOLARIA.**—By continually crossing the finest types of flower, we are able to ensure great diversity and richness of colour, and we continue to save seed from the choicest flowers only, produced on plants possessing the dwarf and vigorous habit, for which our strain has an established reputation. Mixed colours, per packet, 3s. 6d. and 5s., post-free.

**SUTTON'S PERFECTION CALCEOLARIA.**—The Rev. Robt. Hole, North Tawton, says:—"My Calceolarias are surpassingly beautiful from your strain—short, bushy plants crowned with masses of large flowers of every imaginable hue. I have seen nothing to equal them, and this is the unanimous opinion of all who have seen them."

**SUTTON'S SEEDS GENUINE ONLY DIRECT FROM SUTTON AND SONS, THE ROYAL SEEDSMEN, READING.**

**DICKSONS' SUPERB WALLFLOWERS.**—Golden Beauty, Primrose Dame, and Selected Dark Blood-Red are the best single varieties in cultivation. Each 6d. and 1s. per packet, or 2s. 6d. per ounce. Choice mixed Tall and Dwarf Double German varieties, 6d. and 1s. per pkt.; **DICKSONS, Royal Seed Warehouse, CHESTER.**

**FANCY POLYANTHUS.**—A splendid, richly-coloured First Prize Strain. See report of Auricula Show in all the Gardening Papers. Choicest English-saved seed, 1s. per packet, post-free. **J. DOUGLAS, Great Bookham, Surrey.**

**CINERARIA SEED** saved from First Prize Strain, Named Varieties, 1s. per packet. The choicest mixed.—**J. DOUGLAS, Great Bookham, Surrey.**

**KENT, THE GARDEN OF ENGLAND.**—**GEORGE BUNYARD & Co.,** The Royal Nurseries, Maidstone, are the largest growers and the best cultivators of fruit trees. CATALOGUE, six stamps. 800 kinds, true to name.

Normandy, near Guildford, Surrey.

By order of the Trustees.

IMPORTANT SALE of a HIGH-CLASS FRUIT GARDEN and NURSERY, with Possession.

MESSRS. PROTHEROE and MORRIS in conjunction with Messrs. MUMFORD and BOND, will SELL by AUCTION, at the Mart, Tokenhouse Yard, London, E.C., on WEDNESDAY NEXT, May 27, at 2 o'clock, at a low reserve, to balance an Estate, by order of the Trustees of J. P. Parratt, deceased and Mr. Wm. Parratt, the productive MODEL FRUIT GARDEN and NURSERY, of 4 1/2 a. 3 r. 39 p., stocked with thousands of thriving young Fruit Trees of the highest grade, and in splendid condition; 16 modern Greenhouses, heated and fitted upon the best hot-water principles; ranges of newly built Stables, Coach-houses, Van, Cart, and Store Sheds, Piggeries, &c. The soil is of the best quality, and there are 1500 feet of frontage to existing roads. Particulars, Plan, and Conditions of the above, also the Farm and of the remainder of this Estate, may be had on the Premises; at the principal hotels in the neighbourhood; at the Mart; of Messrs. J. & T. PARRATT, Solicitors, Aylesbury; of Messrs. MUMFORD and BOND, Auctioneers, Brill, Bucks; and of Messrs. PROTHEROE and MORRIS, Auctioneers, Valuers, and Estate Agents, 67 & 68, Cheapside, London, E.C.

Wednesday Next, May 27.—Special Sale.

2000 TUBEROUS BEGONIAS, started into growth. This strain of Begonia is the finest in the country. During the past three years the collection has been shown at all the principal London and Provincial Exhibitions, and has gained upwards of sixty First Prizes, Awards of Merit, Diplomas, and Certificates, including three Gold Medals, Silver Cup, Silver-gilt, and Silver Medals.

1000 LILium PHILIPPINENSE, a recent importation of one of the most attractive and useful Lilies, a veritable pure white, long-flowered Lily, much in the style of L. Brownii, having long leaves, linear, light green, slender stems, growing about 2 feet high; found in the Philippine Islands at an altitude of 8000 feet. As easy of cultivation as L. Brownii or L. Harrisonii. Flowering Bulbs in splendid condition.

500 DAHLIAS, green plants, ready for immediate planting, of all the finest and most showy attractive varieties.

20 OBYSSANTHEMUMS, in fine condition, splendid exhibition varieties. A select lot of sorts.

CANNAS.—New, dwarf-growing, large-flowered varieties. Very showy, summer bedding varieties.

MESSRS. PROTHEROE and MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 & 68, Cheapside, London, E.C., on WEDNESDAY NEXT, May 27, at 12 o'clock. On view morning of Sale, and Catalogues had.

Wednesday Next.—American Roses.

A LARGE CONSIGNMENT of AMERICAN EVER-BLOOMING ROSES of the best varieties; same as used by the New York florists. Extra strong large plants, 2 1/2 to 3 feet high; very bushy, in five varieties, viz.,

- BRIDESMAID, BELLE SIEBRECHT, MADAME CUSINE, MRS. PIERPOINT MORGAN, AMERICAN BEAUTY

MESSRS. PROTHEROE and MORRIS will include the above in their SALE on WEDNESDAY NEXT, May 27, at 12 o'clock. On view morning of Sale, and Catalogues had.

Merstham, near Redhill.

25,000 BEDDING PLANTS, in immense variety; and 100 lots of choice STOVE and GREENHOUSE PLANTS, PALMS, &c. Third Great ANNUAL TRADE SALE. By order of Messrs. F. Rose & Co. Without reserve.

MESSRS. PROTHEROE and MORRIS will SELL the above by AUCTION, on the Premises, The Nurseries, Merstham, close to Merstham Station, and a mile and a quarter from Redhill Junction, on THURSDAY NEXT, May 23, at 2 o'clock.

May be viewed day prior and morning of Sale. Catalogues may be had on the Premises, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Friday Next, May 29.

Another Property offered for the first time.

200 ROSE-COLOURED ARUM LILIES (Richardia Rehmanni). Warranted true.

This fine plant has handsome lanceolate leaves, spathes resembling those of the white Arum Lily, but tinged with soft rose colour, which in some of the specimens is rose-purple, especially on the outside on the spathe. It inhabits but one locality, so far as is at present known; and even there it is very scarce. In itself it is a valuable addition to our garden plants, and to the hybridist it will prove a grand plant on account of its novel tint and ornamental character. Plants from the same sander have flowered with the Hon. Walter Rothschild, and were of a pleasing soft pink colour.

MESSRS. PROTHEROE and MORRIS will include the above in their ORCHID SALE, on FRIDAY NEXT, May 29, at half-past 12 o'clock. On view morning of Sale, and Catalogues had.

Friday Next, May 29.

By order of Messrs. W. L. Lewis & Co., Southgate, N. SALE of choice IMPORTED ORCHIDS, amongst which will be found:—

ODONTOGLOSSUM MADRENSE, O. LONDESBOURGHIANUM, G. DOWIEANUM.

LÆLIA DAYANA, a grand lot; L. PEDUNCULARIS, CATLEYA SKINNERI, a very fine lot; C. CRISPA, C. WARNERI, and C. HARRISONIÆ VIOLACEA.

Also, by order of Mr. J. W. Moore, of Bradford.

- 200 CYPRIPEDIUM SPECIOSUM, 1 BELLATULUM ALBUM, 50 DENDROBIUM BENSONIÆ MAJUS, 50 FARMERI (true), 50 PARISHII, 50 FORMOSUM GIGANTEUM, 50 FITCHIANUM, 100 VANDA KIMBALLIANA, and 200 PANAMA HATS, received direct.

MESSRS. PROTHEROE and MORRIS will include the above in their ORCHID SALE on FRIDAY NEXT, May 29, at half-past 12 o'clock. On view morning of Sale, and Catalogues had.

Friday Next May 29

MESSRS. PROTHEROE and MORRIS will include in their ORCHID SALE on FRIDAY NEXT, May 29, at half-past 12 o'clock, a small lot of exceedingly rare semi-established and fresh-collected Costa Rica Orchids, brought home by Mr. Richard Pfau, and including 24 MILTONIA ENDRESII (Odontoglossum Warszewiczii), with growth of M. vexillaria, and handsome white flowers, more nearly resembling M. x Bleviana; a few of the rare MILTONIA SCHROEDERIANA; some strong plants of the beautiful white EPIDENDRUM ENDRESII MAJOR, and healthy plants of Batemanis Burtii Wallichii; all of which are so difficult to import, as to render it necessary to bring them over and tend them; also, fine pieces of ODONTOGLOSSUM SCHLEPERIANUM, and three of the wholly yellow G. S. ATRIUM, ONCIDIUM AMPLIATUM MONSTRUM, BRASSIA BRACHIATA, the largest and rarest Brassia; Cattleya Downiens, Oncidium ansiferum, &c. Also, about 50 plants of a splendid strain of ODONTOGLOSSUM LUTEO-PURPUREUM (?) with magnificent flowers, gathered in a new district. On view morning of Sale, and Catalogues had.

DUMBAROTNSHIRE.

THE ARDDARROCH COLLECTION OF ESTABLISHED CATTLEYSAS and LÆLIAS.

So well known for the grand varieties contained. HIGHLY IMPORTANT SALE.

By order of R. Brooman White, Esq., Without Reserve, who is giving up the Cultivation of Hot-house Orchids.

MESSRS. PROTHEROE and MORRIS are instructed to SELL by AUCTION, on the Premises, Arddarroch, about 3 miles from Garelochhead Station on the West Highland Railway (freight boats leave Craigendorran Pier for Garelochhead Pier, which is about 3 miles from Arddarroch), on TUESDAY and WEDNESDAY, June 9 and 10, at half-past 12 o'clock precisely each day, entirely Without Reserve, the above valuable collection of ESTABLISHED CATTLEYSAS and LÆLIAS, together with about 100 ODONTOGLOSSUM ALEXANDRÆ, in Flower and Bud. Many plants have secured First-class Certificates and Awards of Merit, and have been specially mentioned in the leading horticultural papers and reviews. Amongst the principal plants the following may be mentioned:—

- Cattleya gigas purpurea: Hardyana, labiata varieties, Mendeli Bluntii, Kiln's variety, Empress of India, Whitei, Rajah, Wallichii, Mrs. Brooman White, superbissima, Sea-gull, Morganie type, J. O'Brien, Argus, Adonis, Eonchantress, Duchess of Montrose, Cook of the North, Mossie Wagnerii, Horsmanni, Rex, Trianae alba, 3 plants, 100 Plants of CATTLEYA AUREA, also about 150 Plants of ODONTOGLOSSUM ALEXANDRÆ in flower and bud.

May be viewed any day prior to the Sale on application to Mr. G. Roberts, the Gardener. Catalogues may be had on the premises, and of the Auctioneers and Valuers, 67 and 68, Cheapside, London, E.C.

Friday, May 29, 1896.

MESSRS. PROTHEROE and MORRIS have received instructions from Messrs. F. Sander & Co. St. Albans to SELL by AUCTION in their Central Auction Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, May 29, at Half-past 12 o'clock.

THE PURE WHITE CATTLEYA GIGAS.

The whole consignment is offered. We cannot guarantee all, or, in fact, any, excepting lot 826, to be pure and snow-white, but this lot we do guarantee as being, not only pure white, but grand in form and size. The whole batch is possibly white. The peons assert that this is the case, and our man has good reason for believing them, but lot 826 is the only one he is certain about, and therefore we guarantee it. They are most distinct looking plants, and, as one is white, there is no reason why all should not be. Also

CATTLEYA AUREA.

The Monte Cornelia Form. The finest of all. The flowers are unequalled for size and brilliancy of colour. Our Collector assures us that even C. Chrysozona, hitherto considered the finest in this section, is totally eclipsed by this magnificent form, some of the labellums he saw being 4 inches across and the most rich colours.

The whole of the plants received of these two superb Orchids will be offered on FRIDAY NEXT, May 29. On view morning of Sale, and Catalogues had.

Southwick, within 2 1/2 miles of Brighton (West). IMPORTANT SALE of MARKET GARDEN LAND.

MESSRS. WM. WOOD, SON, AND GARDNER will SELL by AUCTION, in a Marquee on the Estate, on TUESDAY, June 2, 1896, at 3 o'clock, several plots of very rich MARKET GARDEN LAND. Free conveniences. Easy instalments. Particulars and Conditions of Sale may be had of F. W. VERRALL, Esq., Solicitor, Worthing; and of Messrs. WM. WOOD, SON, AND GARDNER, Land Agents and Surveyors, Crawley, Sussex.

**AN APPEAL.**

MANY of the older generation of Housekeepers will remember Mrs. ELIZABETH WARREN, the Editress for many years of *The Ladies' Treasury*, and Authoress of a large number of practical works on Cookery and Domestic Economy. At an advanced age, and in too feeble a state of health to continue her work, this veteran authoress has fallen penniless, owing to circumstances entirely beyond her own control. This is a hard fate for one who has worked so much, during a long life, for the good of others. Some of her literary friends are endeavouring to raise a fund to comfort her remaining years, contributions to which, however small, will be thankfully received by—  
Miss ELLEN T. MASTERS,  
4, Mount Avenue, Ealing, W.

**GARDENERS' ROYAL BENEVOLENT INSTITUTION.**

THE 57TH ANNIVERSARY FESTIVAL DINNER, in Aid of the Funds, will take place at the "Hotel Métropole," on SATURDAY May 30, 1896, when the Right Hon. the EARL OF LATHOM, G.C.B., P.C., will preside. The Committee have the pleasure to announce the following further amounts, which have been promised or received, and added to the Chairman's List:—

H. Morley ... ..	£25 0 0	A. Clanfield (annual) ..	£1 1 0

Prices from £17, including Pump and Timber Supports.

May 27, 1893, The Dell, Englefield Green, Surrey.

ROBERT WARNER & Co., Engineers, 37, Jewin Crescent, E.C.

Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail geared Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,

H. BALLANTINE, Head Gardener to Baron Schröder.

R. WARNER & Co. have made and erected a similar Mill and set of Pumps for Lord Northbourne.

NUMEROUS OTHER TESTIMONIALS ON APPLICATION TO

## HILL & SMITH, BRIERLEY HILL, near DUDLEY.

## H. & S.'s BLACK VARNISH, For Iron, Wood, or Stone Outdoor Work.

REGISTERED TRADE MARK.

Forty years' regulation. Ready mixed. Dries in ten minutes with perfect gloss. Is used at Windsor Castle, Kew Gardens, and London and Dublin Parks, and most Landowners. In 18 and 36-gallon Casks only, 1s. 6d. per gallon at works, 1s. 8d. at nearest Railway Station.

**CHEAP CLOTH**  
For Trouserings, Suitings, Ladies' Jackets, Melton and Tweed Dress Cloths. Patterns sent post free.  
C. HEWITT, 14E, Winfield Road, LEEDS.

## STANDEN'S ESTABLISHED OVER 30 YEARS. MANURE.

Exceeds all others in General Fertilising Properties and Staying Power.

It promotes a rapid, healthy, and robust growth to plants generally.

It is a clean and dry powder, with very little smell. The highly-fertilising properties of this Manure render its money value, in comparison with other Manures, at least double; and users will find that very small quantities will produce favourable and lasting results.

THE ANALYSIS SHOWS—

THE  
**Gardeners' Chronicle.**

SATURDAY, MAY 23, 1896.

**STRAWBERRIES IN THE PROVINCE OF NAPLES.**

**N**APLES is, as is well known, one of the most populous cities of the world; cultivation, therefore, especially on the small tracts of common land near the town, is on a most extensive scale, as produce finds a brisk sale in the great market of this district.

The cultivation of the Strawberry has greatly extended into the province, the demand being very large; the system employed has, in most cases, special characteristics that distinguish it from the ordinary modes of cultivation described in gardening books. The plants are grown, in fact, in the fertile plain included in the land of the province of Terra di Lavoro, not in gardens, but in ordinary soils, whereon the Vines grow beside Poplars and cereal and herbaceous plants, such as Hemp, Wheat, Maize, &c.

The kinds cultivated here are two—the *Fragaria vesca*, ordinarily called common or red Strawberry; and the *F. chiloensis*, Ehrh., var. *ananassa*, Duchesne, commonly called Ananas *ananassa*, or Garden Strawberry.

Its place in the rotation of the crops (*avvicendamento*) is the fourth, as generally the Maize is cultivated first, Wheat second, followed by green manuring; Hemp third, and Strawberries the fourth year, and after.

The duration of a Strawberry plantation extends, for the common Strawberries, from three to six years, and over even ten years for the Ananas.

In September, after the Hemp-harvest, the ground is dug to the depth of from 1 to 1½ foot, and raked over. Barley is afterwards sown in rows 10 to 12 inches distant from each other. During the time from October to January, and after the cereal is grown, the small plants of Strawberries are planted, without any other preparation, between the rows of Barley, being arranged in alternate rows at a distance of about 12 inches from each other.

The plantation is made with a planter, and is always done by two labourers. They are placed at the two extremities of the little field, and work forward, each at the same time putting in three rows of Strawberries. The runners are usually planted singly, or in clusters varying in number according to the strength of the plant; each cluster may contain as many as twelve runners. The little plants are obtained from a one-year-old Strawberry-bed, or from wild plants; in the latter case, the clump from the small plant always contains very few plants. Gardeners, however, prefer wild plants to the cultivated ones, as it is known for certain that the Strawberry-bed bears better, and the fruit has a finer aroma. Here, again, is noted the effect produced by improved cultivation, which, while valuable to some plants, is unsuitable for others. Thus, *Fragaria vesca*,

which is a very sturdy plant, soon dwindles when cultivated, the aroma of the fruit is less, and the physiological equilibrium between the productive and vegetative systems is disturbed to the benefit of the latter. But Strawberries are never grown alone. Barley is associated with them during their first year, or Wheat is substituted for it, in rows, as has been said, in cases where Strawberries are not planted between Beans, or in the Pear and Apple orchard. But these latter cases are less frequent.

When Barley is sown, it is generally mown as fodder in spring, and the ground disposed in beds about  $5\frac{1}{2}$  feet wide, and divided from each other by a furrow 12 inches wide. After this, early French Beans or Maize can be sown between the Strawberries.

In subsequent years the plants are always associated with Beans or late Maize, to afford time for the Strawberry harvest, which is from April 10 to June 15, or thereabouts. Strawberries are hand-gathered daily, the stalk being broken with the thumb-nail.

The method of cultivation used is certainly not perfect, but is constantly being improved. And now for the weeding. After mowing the Barley, the roots and leaves are removed, and the ground is manured with road-sweepings, in the proportion of about 45 cubic metres to every hectare. [1 c. m. = 1.31 cubic yard; 1 hectare =  $2\frac{1}{2}$  acres (*circa*).] This quantity, however, is very variable, especially with the Ananas (Pineapple) Strawberries, which sometimes are not manured at all.

The manure is spread by hand, and is covered over lightly with earth, which the gardener carefully and evenly spreads with the mattock, taking the soil from the dug-up ground, so that the earth remains divided into rows  $5\frac{1}{2}$  feet apart, as before said.

In December the Strawberry-bed is cleared, and re-stocked with the plants required. In January and February of the second year the ground is again manured and weeded with care, extirpating even any Strawberry-runners that are left. This plan is repeated until the fourth year, and sometimes even until the fifth or sixth. As may be seen, manuring and weeding are but little done.

A practice which does not seem sensible at first sight is that of mowing the Strawberry-bed as soon as the fruit-gathering is over; but it should be remembered that the Strawberries are cultivated without irrigation, so naturally the production depends very much on atmospheric conditions, i.e., on the season being more or less favoured by rains, and it is understandable that, by cutting down the plants, their evaporation in summer is prevented, and the plants will shoot up in the autumn with greater vigour.

In this way the *Sphaerella fragariae*, known in England as white-rust, blight, or spot-disease of Strawberry leaves, and the forms of which are all known—*Conidia* (Graphium, Desm.; Graphiothecium, Sacc.; Ramularia Sacc., Peck.; *Cylindrosporium*); *Spermatogonia* (*Septoria fragariae*, Desm.); (*Ascochyton fragariae*), Lib.; *Phyllosticta fragariaecola*, Desm.); *Ascophora* (*Stigmatea fragariae*, Rul.), is prevented from appearing in consequence. The formation of the reproductive system of ascophore of the *Sphaerella fragariae*, Sacc., is prevented, which otherwise would permit to the parasitical to remain during the winter in the ground. And the plan suggested by the pathologists, i.e., to take off the infected leaves, and to pulverise the plantation with a mixture of

sulphur and quick-lime, is rendered unnecessary. The net proceeds of an acre of Strawberries are about £7. *Dr. Giovanni Mottravale, Portici, May, 1896.*

## NEW OR NOTEWORTHY PLANTS.

### CENOLOPHON VITELLINUM, *Horaniinow*.

This plant was first described by Lindley under the name of *Amomum vitellinum* (*Journ. Hort. Soc.*, ii., 245), in 1847, from a plant of unknown locality, cultivated in the Chiswick gardens. He figured it also in the *Botanic Register*, 1847, t. 52.

It was supposed to have come from Ceylon, but no

leaves lanceolate acuminate petioled, 10 inches long, 3 inches across, dark green; petiole short, less than  $\frac{1}{2}$  inch long, ligule rounded, usually split, edged with red fur,  $\frac{1}{2}$  inch in length; panicle terminal much shorter than the leaves, branches few, rachis pubescent, 4 inches long. Bracts narrow linear, caducous, light green, 3 inches long. Flowers sessile or nearly so; calyx tubular, green, pubescent, 1 inch long, trifold and split along the back; corolla-tube as long as the calyx, yellow, lobes linear, blunt, erect, 1 inch long, posticous one hooded, yellow; lip longer than the corolla, flat (not convolute as in typical *Alpinias*), oblong, cuculate, apex bilobed, edge crisped, orange, veined with darker colour and numerous red dots. Anther filament shorter than the lip, flat, pale orange, connective (crest) very large three-lobed and much

FIG. 101.—MESSRS. WILLS AND SEGAR'S GROUP AT THE TEMPLE SHOW. (SEE P. 650.)

one seems to have seen it again, till in April of this year while I was staying on Penang Hill, Mr. Curtis and Mr. Woolridge, a local amateur of plants, came across some plants in full flower, growing in dense jungle on the top of the hill, at an altitude of about 2000 feet. The description and figure agree very well with the Penang specimen, except that the latter are bigger and stouter, attaining a height of  $3\frac{1}{2}$  feet, the stems being  $\frac{1}{4}$  inch through, and the inflorescence was not a globose spike, but a few-branched panicle. The bracts, too, are described as oblong,  $\frac{1}{2}$  inch long, while in the Penang plant they were (at least the lower ones), narrowly linear and 3 inches in length. They are, however, very caducous, and perhaps most had fallen off in the Chiswick garden plant.

The following is the description of the Penang plant:—Rhizome stout, branched; stems 3 to  $3\frac{1}{2}$  feet, tall, dull green, slightly flattened and ribbed;

incised; staminode at base of free portion of the filament adnate to lip (as in many *Alpinias*), short linear, subulate red. The anther-cells are divaricate at the apex.

From this it will be seen that the plant is very closely allied to *Alpinia* (such species as *A. bracteata*), differing only in the development of the anther-connective. In most *Alpinias* the sides of the lip are convolute round the stamen, or so erected as to compel the fertilising insect (usually a bee) to go direct to the nectary along the line of the lip. In the *Cenolophon* the lip is quite flat, so that the fertiliser could get at the honey from the side of the flower without touching the pollen, were it not for the large connective which closes the entrance at the sides.

The plant bears no definite relation to any *Amomum*, and the only question as to its classifi-

FIG. 102.—MESSRS. KELWAY'S TREE PEONY FLORIZEL: FLOWERS WHITE. (SEE P. 650.)

cation can be whether *Cenolophou* should be kept as a distinct genus, or as an aberrant section of *Alpinia*. The typical *Cenolophou* (*C. rubrum*, Bl.) is a very little known plant from Celebes, with which, generically, *C. vitellinum*, of Horaniow, appears to agree. It will probably be most convenient to retain the genus *Cenolophou* for these plants, placing them, as indeed Horaniow does, close to *Alpinia*. *H. N. Ridley, Singapore, April, 1896.*

## ORCHID NOTES AND GLEANINGS.

### LÆLIA PURPURATA.

Mr. W. E. JOHNSON, gardener to J. Moore, Esq., Borton-on-the-Water, sends us a spike of *Lælia purpurata* with a perfect leaf produced on the raceme above the lowest flower. It is the first time we have seen such an occurrence in this plant.

### CYPRIPEDIUM CHAMBERLAINIANUM.

Having seen several notices in the *Gardeners' Chronicle* referring to the long time the above plant will continue to flower, I may say we have here a plant that commenced flowering in June, 1893, and has flowered continuously ever since. The first raceme finished flowering in April of this year, after bearing flowers for a period of two years and ten months; and during that time the plant made a strong growth, which commenced flowering simultaneously with the other raceme going over. As showing what a vigorous constitution the species possesses, the new raceme is stronger than the old one, and at the present time it has three flowers open upon it, and there are also two new growths coming on. *William Dawes, Little Ness Gardens, Shrewsbury.*

## METHODS OF PROPAGATION.

(Continued from p. 618.)

ORNAMENTAL VARIETIES OF THE CRAB.—Among cultivated Crabs there are many forms richly deserving a place in pleasure-grounds and shrubberies, and beautiful objects to stand singly on a lawn. In front of me, whilst writing, I have a branch of a Japanese Crab covered with flowers of a bright carmine colour, the variety of *Pyrus floribunda*. Then we have *P. M. spectabilis*, not so brilliant in colouring, nevertheless a useful companion plant to the above, and flowering somewhat later. The old-fashioned Siberian Crab, or "Cherry Apple," is well worthy of cultivation for its pretty blossom and elegant fruit, while the latter may be made good use of by the housewife, as many other kinds of fruiting Crab. There is also a form of Siberian Crab called the American variety, which bears oval fruits, and two new sorts worthy of culture, the first having an elegant weeping habit, must be grafted on a tall stem, in order to exhibit its full beauty, this is named *Elize Rathke*; and the second an exceedingly handsome form, named *John Downie*, which, if not very attractive when in flower, produces abundance of highly-coloured fruits in the autumn. Then there is the dark crimson fruited Dartmouth, and other well-known Crabs, that may be grafted on the wild Crab or on the Paradise stock, and grown as standards, dwarfs, or pyramids, making good trees for conspicuous positions, while the fruits are well adapted for decoration in the house or on the dessert-table, or used with the foliage retained on the branch for church decoration at harvest festivals, &c.

So much for fruit-tree grafting; now for a few words concerning the same operation among purely ornamental trees. These are all increased in nurseries by grafting, marching and budding. Let us now take the grafting, and I may here remark that the processes are more complicated and difficult than fruit grafting, for the simple reason that the bark or outer skin of many ornamental trees is thin and fragile, therefore very easily broken and bruised by the unskilful workman.

It will be advisable to take these subjects in the order of their leafing. First the Willows and Poplars, which though easily increased from cuttings are yet

more rapidly produced from grafts and buds, as the scion or bud may be inserted in a tall already-formed stem where it will soon form a good head, thus saving much time. This subject will be resumed shortly. There are other fruit trees which must not be forgotten, namely the Medlar, the Chequer (*Sorbus domestica*), and the Quince.

The first is frequently grafted on the common Hawthorn, on which it grows but slowly, making, however, a fertile and long-lived tree; but for rapid work the Pear stock is the better one, and on this stock the various Medlars may be grafted or budded either at the ground-line, or at a height of 5 to 6 feet. The Dutch produces the largest fruit, and forms a depressed and spreading head, and its large white blossom makes it a handsome tree in the spring, but the fruit is dry and insipid. Preference should be given to the Nottingham, which, although it has small fruits, has the best flavour; the Royal Medlar to many palates is too acid. These two trees are more upright in habit, and smaller in the blossom and fruit.

The Quince may be budded or grafted; the only variety, with the exception of some novelties from America and the Continent, is the Pear-shaped; the one called Portugal is tender, and blossoms too early for our climate. All may be raised from suckers, or grafted or budded on the common Quince stocks, but unless worked high up, they take a long time to make a good head. It often occurred to me that as the Pear can be grafted and budded on the Quince, if the reverse were practicable, viz., the Quince on the Pear? which might be worth trying. And here is another problem for an experimental gardener or amateur. I must confess that I never essayed it. The last-named fruit I have found in my travels is almost unknown out of Kent and Sussex; I allude to the Chequer tree, or edible Service. This is found as a wilding in the Weald of Kent, and in those parts of Sussex adjoining. The trees are very handsome and marked, assuming an elegant pyramidal form, while the foliage is glossy green above, and slightly silvery beneath, deeply lobed, and elegant; the flowers, produced in May, are white, and conspicuous. The fruit, like the Medlar, only edible when in incipient decay—"bletted." The stock for this is the Mountain Ash, on which it may be grafted in the spring, or budded in July. A near relative is, to my thinking, one of the most attractive flowering trees, next to the Thorns, that we possess. I allude to the "Snowy Mespilus" or Grape Pear of America (*Ame-lanchier Botryopium*). Whether in flower in May-June, or in its scarlet livery in autumn, this tree is worthy of more extended use. To successfully graft it, the scion should be taken from the wood of the year before, but cut with a heel of older wood at its base, while great care should be used not to bruise the bark, but to cut it clean with a very sharp knife, well binding the scion to the stock, which, like the Chequer, should be the Mountain Ash (*Sorbus aucuparia*), and using grafting-wax to cover the union. *Experience.*

(To be continued.)

## HORTICULTURAL SCHOOLS IN BELGIUM.

THE Belgian Government has, for a long time, contributed generously to the support of agricultural and horticultural science, which has become a national study. Instruction is also given in the principles of agriculture in all the more important garrisons, so that after his period of service the peasant youth may return home with a knowledge sufficient to enable him to intelligently till the fields. The school of horticulture at Ghent was founded in 1849. The teaching staff consists of a director and six professors. The course of instruction is entirely free to Belgians, but foreigners must pay a fee of about £7 per annum. The school is required by the State to combine theoretical and practical work; the tone of its instruction is highly scientific. It aims to graduate learned horticulturists, and is particularly devoted to the cultivation of ornamental flowers and plants. The institution at Vilvorde, on the contrary, pays

especial attention to the kitchen garden, and endeavours to educate practical workmen. The Ghent school makes a specialty of the cultivation of hybrids, and of work in the laboratory. The chief plants cultivated and studied are Palms, Ferns, Azaleas, and Camellias. Arboriculture is taught to perfection. The course of instruction covers a period of three years. The examinations for admission take place during the first week in October, and the candidates must be sixteen years of age. The subjects of examination are an exercise in writing and orthography, a simple composition, arithmetic (including the metric system), explanation of a printed extract, general geography, and national history. All the lectures at the school are given in the morning, and during the afternoon the students are divided into three sections. Each of these sections is occupied one week at a time in a horticultural establishment, in a nursery, and in the botanical garden, rotating throughout the year between these three places. A thoroughly practical instruction is thus imparted. Examinations for advancement from one class to another are held every August before a jury appointed by the Government. In addition to the regular course of instruction, there are several annual series of lectures which are open to the public. For example, for thirty-five years there have been given annually twelve to fifteen lectures on fruit-tree arboriculture. These are delivered on Sundays in Flemish, especially for gardeners; and every Thursday they are repeated in French for the general public. For three years a course of lectures upon kitchen gardening has also been given. As regards the commercial relations of horticulture which have in recent years contributed so greatly to the prosperity of Ghent, the number of horticultural establishments in Ghent and its suburbs is 366. There are 2535 hot-houses, with 3,625,500 square feet of glass-roofing. The total space occupied by cultivation amounts to 1521 acres. There are about 20 very large establishments, and these have 70 to 72 hot-houses each. Concerning the capital invested, accurate statistics do not exist, but estimates vary from £800,000 to £3,000,000. The difference may be explained by a variation in the extent of territory comprised in these respective figures. Numerous societies exist throughout Belgium for the promotion of the interests of horticulture, the most important organisation of this kind being at Ghent—the Royal Society of Agriculture and Botany. There are altogether in Belgium 25 important, and 15 smaller societies of horticulture and botany. The total membership approximates 12,000. There are a dozen great floral exhibitions annually held in Belgium, and prizes amounting to £1000 are yearly distributed. Finally, all these various societies are united in a national organisation known as the "Fédération des Sociétés d'Horticulture de Belgique." This organisation holds annual conventions, and publishes a series of bulletins in the nature of reports of its proceedings. The first international congress of horticultural botany was held at the Brussels Exposition of 1864. *Journal of the Society of Arts.*

## FLORISTS' FLOWERS.

### THE CARNATION FROM SEED.

SOME remarks were made at p. 550 on raising Auriculas, Polyanthuses, &c., from seed, and the results obtained by cross-fertilisation, and in a private note to the Editor I stated that I had obtained about 80 per cent. of yellow and white Polyanthuses from yellow and white parents. Similar results were also obtained from yellow Auriculas. The seeds from edged varieties, perhaps, do not produce 50 per cent. of edged varieties.

It is now time to sow seeds of Carnations to produce plants that will flower next year. Many amateurs are now raising seedling Carnations, owing to the distribution of seed by the Carnation Society. Seedling Carnations appear above-ground in a week after the seed is sown, if aided by a little bottom-heat. The plants grow rapidly if pricked out in the open

garden after being gradually inured to the open air, and grow into fine flowering specimens by the autumn. The next season they flower at the usual time (July).

I wrote an article on the raising of seedlings in the *Carnation Manual* a few years ago, in which I gave the results of raising seedlings by cross-fertilisation from the best named varieties. To begin with, some 12 to 15 per cent. produce varieties with single flowers; 70 or 80 per cent. would have double flowers of one sort and another, but all inferior to the parentage; some 5 or 6 per cent. would be worth trying again, and not more than one in 500 would be worthy of holding a first place. It is very difficult indeed to obtain good form in seedlings, but the variation in colour is remarkable. The yellow-ground Picotees vary to the greatest extent; a large proportion of the seedlings will be selfs of various colours, and many will be nondescript white-ground varieties.

We know where the first yellow-ground Carnation came from; but it would be of much interest to know how it was produced. It was sent from Constantinople to London towards the end of the sixteenth century. Lady Mary Wortley Montague, writing from Constantinople on January 4, O.S., 1715, says, "My chamber is set out with Carnations, Roses, and Jougouils fresh from my garden." I have raised many thousands of seedling Carnations, but have never yet obtained a yellow-ground variety from a white ground, showing that the first sport must have been quite exceptional. The above quotation from Lady M. Montague's letters would show that the Carnation was a common flower at Constantinople nearly 200 years ago; and in such a climate, seedlings would be easily produced.

I expect during the next few years to see many remarkable varieties of seedling Carnations. The Editor of this paper, I am sure, would be pleased to have any eccentric productions in form or colour sent to him for exhibition at the Scientific Committees held in July and August. The curious fancy Auriculas used to be thrown away as soon as the flowers appeared, but a collection of them has been formed, and they are much admired by tasteful persons. They are also interesting to the scientist as being probable reversions to the state of the Auricula early in the eighteenth century.

The study of seedling Carnations in their infinite variety is most interesting when the record of the crosses have been kept. I have a batch of seedling tree Carnations now flowering, obtained by crossing Uriah Pike, a dark crimson variety, with white and rose-coloured sorts; there are rose and red-coloured varieties of many tints, and as yet only one with white flowers, but many of them are merely replicas of Uriah Pike, and yet there can be no doubt that the flowers from which the seed was obtained were cross-fertilised. The plants have been cultivated in pots from the first, and none of them have produced single flowers. This may have happened from the same cause. Single Stocks, if grown in pots for seed, produce more double flowers from the seed than if the same plants had been planted out.

#### GOLD-LACED POLYANTHUS.

In answer to "J. P.," I have already stated why the gold-laced Polyanthus were omitted this year from the schedule of the National Auricula and Primula Society (Southern Section). Doubtless they can be included again, if fanciers will support the Society. I knew quite well what I was writing about when I stated that the varieties which were exhibited sixty years ago were still the best at the leading northern exhibition. George IV. (Buck), mentioned by "J. P.," still holds the highest place; and in a list before me, published 1833, George IV. (Buck) is included; there is also George IV. (Waterhouse), but that seems to have gone out of cultivation. It may be interesting to fanciers to give a list of the best twelve sixty-three years ago; they are—Alexander (Pearson), George IV. (Waterhouse), Prince of Orange (Cartwright), George IV. (Buck), Princeess Royal (Collier), Lord Nelson (Park), Lord Crewe (Clegg), Invincible (Crownshaw), Defiance (Timmin), Bang Europe (Nicholson), Jolly Dragon (Eckersley),

Prince Regent (Cox). Burand's Formosa did not come in as one of the best twelve, but there is an excellent coloured plate of it in the *Floricultural Cabinet* for July, 1834. It is stated to have been raised from seed in the garden of J. P. Burand, Esq., Formosa Cottage, Holloway, near London. Mr. John Renell, of Sheffield, was the leading cultivator and writer on Polyanthuses in those days. A paper by him is published in the *Floricultural Cabinet* for August, 1834, and the more important points of culture are: Compost for potting—"Three barrowfuls of light maiden soil, one of stable-manure six weeks old, one of decayed leaf-mould." He further adds:—"I pot in August, for if done sooner they are too early in bloom for the show, which takes place in the latter end of April or early in May. In parting the old roots, I cut off all the leaves, then pot them in the above-stated compost, and place them in a shady position, where I let them remain till November." These are the leading points in his culture. In November the plants are put in frames or pits, which are covered with shutters instead of glass lights. The details of preparation for exhibition, flattening the pips, and thinning them out, &c., are rather tedious, but he asserts that if the plants are placed in total darkness for two or three days before the show, the colour becomes much darker, an assertion which any fancier can prove for themselves. I may remark, as showing to some extent the number of fanciers, that all the thirteen varieties I have named are by different raisers. J. Douglas.

## TREES AND SHRUBS.

### JUNIPERUS PACHYPHLLÆA.

Owing to the intense glaucous hue of its foliage, this species is one of the most distinct and interesting of hardy Junipers. The difference in colour between the old and young foliage is likewise remarkable, that of the young shoots for at least half the year being so intensely glaucous, that they appear as if coated with hoar-frost, while the older is of a soft bluish-green.

Generally, the habit is irregularly upright, rarely formally so, the branches comparatively short and erect, and the scale-like leaves, broad and short, stiff and sharp to the touch, and very closely arranged. The berries are produced in twos and threes, and resemble greatly both in shape and colour those of our common Juniper, but they are twice as large, or fully half-an-inch in diameter, and in the young stage suffused with the same silvery-glaucous hue for which the foliage is so remarkable. This Juniper is quite hardy, but has, with several other species of Juniper, the unfortunate drawback, for ornamental purposes at least, that the lower branches give way even in specimens that are freely exposed to light and air. It is not averse to rather stiff soil, and to exposed situations. A. D. Webster.

### MAGNOLIA KOBUS,

claimed to be the hardiest Magnolia, is blooming on young seedling plants about 6 to 8 feet high. It has been considered a shy bloomer while young, but these seedlings, now six years old, have bloomed sparingly for two seasons. It blooms with *M. conspicua*, and three or four days before *M. soulangeana*; flowers pure white, smaller and whiter than *M. conspicua*, but larger than in *M. stellata*. I find it an excellent stock for grafting *stellata* on, which is an elegant little bush, but so slow a grower that it is hard to get up to salable size, and is always scarce. S. C. Moon, in the "National Nurseryman."

## THE PRODUCTION OF GARDEN VARIETIES IN PLANTS.

The origin of the garden Cineraria has perhaps been sufficiently discussed, until we can get some practical information from gardeners who have manipulated the wild plant. I am now flowering seedlings from *C. cruenta*, and find there is scarcely any difference between the seedlings and the wild plants. I am saving

seed from these, and they have been flowered in a house 300 yards from any other Cineraria. Even at this distance, however, a bee may convey the pollen from one to another. I certainly do not expect to see much change in the seedlings next season. The *Botanical Magazine* specimen was figured in 1798; and Mr. W. Curtis there states that "the seed usually proves abortive," and that the plant was propagated by division. I am sorry I have not a plant of *C. lanata*, so that I could cross the two species, for *C. lanata* has, perhaps, more resemblance to the garden Cineraria than *C. cruenta* has [save its now herbaceous character], and it is also more liable to be infested with aphides than *C. cruenta*, which is also a strong characteristic of the garden varieties. But my object in referring again to this subject is not to discuss the Cineraria alone, as all my experiments so far go to prove that most garden varieties of popular flowers are the results of hybridisation between species rather than of cross-fertilisation in the first place. If two species of the same genus be hybridised, the progeny usually bears a likeness to both parents. Some twenty years ago, I crossed *Aquilegia californica* with *A. chrysantha*, and at the same time, *A. cœrulea* with *A. chrysantha*. In each instance the cross was intermediate, and when I exhibited them at Regent's Park, with particulars of their parentage, they created quite a sensation. Seed saved from these hybrids year after year has produced a most remarkable combination of beautiful colours. I parted with the seed to Messrs. Veitch, of Chelsea, and they have produced by selection a most varied race; but the uncrossed parents do not change, and perhaps few who grow the hybrid *Aquilegias* in their gardens know anything of the source whence they were derived. Certainly, some of the seedlings bear no trace of the original parentage. I had seedlings from Messrs. Veitch's strain with white flowers, but one may expect almost any change in colours.

My point is, that such variation arises most readily from hybrids after the first original cross. On the other hand, when a cross is effected between an original species on the one hand, and a garden variety of the same genus, there is much greater variation. I have experimented a good deal with *Primula* species, and witnessed an interesting result from seed saved in 1894. In that year I saved seed from *Primula pubescens*, but the plant was placed by accident near a frame containing Auriculas, with the result that the seedlings which have flowered this year are intermediate between the Auricula and *Primula pubescens*; but there is considerable variation also, I believe, owing to one of the parents being a garden variety and not a species. The humble-bee does much cross-fertilisation in a house of flowering plants. It has been stated in the *Gardeners' Chronicle* that a bee will not visit a mutilated Auricula flower—this is an error; they pay no attention to the state of the flowers, thrusting their snouts into mutilated flowers, and half-faded ones, as freely as into the more perfect. I saw a humble-bee enter the Auricula-house the other day, and I watched its movements for more than a quarter-of-an-hour; during that time it visited 508 flowers, and flitted rapidly from one to another, the entire length of the staging being filled with plants to the extent of 50 feet.

I need not add any more to what I have said of the laced Polyanthus at pp. 550 and 551. There is so little variation in seedlings obtained from the named varieties, that I believe it has descended by ordinary generation from the Cowslip.

I have raised the *Hippeastrum* in quantity from seed. How can one account for the infinite variety of colour and form in the garden varieties of this plant, except for the fact that few garden plants have benefited so much from the hybridisation of distinct species? Deau Herbert began the work early in the present century, and carried it on for some thirty years. He describes some twenty-three crosses in the *Amaryllidaceæ*, which he effected at Mitcham, and afterwards at Spofforth. These would not be all lost. Herbert's great work was published in 1837; and he was working on the *Hippeastrum* up to that date. And I have the authority of W. S. A. de Graaf, of Leyden, for

saying, that his father began to hybridise and cross-fertilise the *Hippeastrum* in 1830; but his work was begun and carried on by hybridising in the first place. Some thirty years later, Messrs. Veitch, of Chelsea, introduced the distinct species *Hippeastrum pardinum* and *H. Leopoldi*, and by obtaining the best varieties from de Graaf and others, they have brought the garden varieties to their present character. There is no other garden flower more varied in form

he has been since he started in 1862. We can trace the progress of the *Hippeastrum* through the century, and fresh blood has been brought in constantly through distinct species being used as seed or pollen-bearers. If the above is correct, reasoning from analogy, we must conclude that wherever great variation of character exists in any garden plant, it is probable that this variation is the result of hybridisation rather than of cross-fertilisation.

#### FRUIT EXPERIMENTS AT WOBURN.

THE invitation issued by the directors of the Experimental Fruit Farm at Ridgmont, near Woburn, is one which should be accepted by anyone who is interested in the improvement of fruit culture. It is not often that scientific and practical work are met with in such happy and instructive combination, and

FIG. 103.—MR. C. TURNER'S GROUP OF ROSES AT THE TEMPLE SHOW (SEE P. 650).

and colour than this one, but if we trace its history from Herbert's work, beginning in 1810, or a little earlier, it will be found that all the growers who have made their mark in raising high-class varieties have practised hybridisation as well as cross-fertilisation, and all of them had a definite object in view. Mr. S. A. de Graaf says his father worked for rich colours, but when the work was handed on to the son he tried for large flowers, and for this purpose obtained species (not garden varieties) with large flowers, and those of us who have seen De Graaf's work in this class of plants at Leyden, know how very successful

I believe that in a few years we shall find this abundantly proved in the Orchid genus, *Calanthe*. The first step was taken when the late Mr. Dominy raised *C. Veitchii*, which was described by Dr. Lindley in the *Gardeners' Chronicle* for the year 1859, p. 1016; it was a hybrid between the purple spotted *Calanthe vestita*, male parent, and *Limatodes rosea*. Mr. Norman C. Cookson, of Wylam, and others, have at distant intervals followed up Dominy's work, and there is at present very considerable variation, nothing of which would have been obtained without hybridisation in the first place. *J. Douglas.*

it may safely be said that there is something of interest for all. The broad plan of procedure is a subdivision of the greater part of the ground into sections, which are planted on different systems, with the object of indicating the most appropriate and economical methods of utilising the ground respectively by the cottager, farmer, and market grower. But within these simple limits there is a large network of experiment, which embraces every morsel of the plant, root, and branch, and extends to hybridisation. When the time for reports comes on, I should like to suggest that in addition to the com-

plete report of the experiments, which Mr. Spencer Pickering will, it is to be hoped, eventually publish, there should be an abridged edition, in which the mere abstruse experiments of special scientific interest shall be subordinated to records of the practical work, on the ground that the sympathy of the doubting farmer can be best won, and he himself led on to higher things with the greatest certainty, by a succinct story of plain work a-day progress.

In the latter connection, nothing can be more significant than the experiment of planting a number of trees on the shuffle-scuffle system—unfed soil, small holes, broken roots, and no pruning. These trees are growing side by side with others, in which the most

so that the visitor in need of a practical lesson can have it. Further, there are experiments bearing on the particular methods of cutting—a movement, so to say, from principles to details. The exact spot, as regards the bud, at which a knife is passed through the shoot is a matter of small concern to the average pruner; but it is a fact that some of the most experienced “knifemen” lay great stress upon it. At Ridgmont there is abundant material for comparisons. Not less interesting, perhaps even more so, are the experiments with stocks. There is no man so bold as to maintain that the stock problem is solved by an airy reference to Crab or Paradise for Apples, Free or Quince for Pears, Myrobalan or

hardly fail to accrue. The practical work is being excellently done by Mr. L. Castle; indeed, the rapidity with which 20 acres of ground have been covered by experimental quarters of young trees is not a little striking. *W. P. W.*

## ALPINE GARDEN.

LYCHNIS LAGASCÆ.

This pretty little Pyrenean alpine seldom does well in our climate, for being shrubby and evergreen, its

FIG. 104.—MESSRS. SUTTON'S GROWING PEAS. (PHOTOGRAPH TAKEN AT TEMPLE SHOW.)

(See Report on p. 650.)

approved method has been adopted, and nothing could better bring home the truth of the practical teaching which has been disseminated so widely of late years. Such a simple test as this must, one would think, strike the most bovine intelligence. The badly-planted trees are dismal scarecrows by the side of their better-treated neighbours, Cox's Orange Pippin being particularly conspicuous. As a further experiment, a number of trees have been set apart for the purpose of illustrating the result of an attempt to improve badly-planted trees.

Pruning has an equal share of attention with planting. There are, to begin with, drifts of trees which have been shortened at planting time, and there are others which have not been headed back

Brompton for Plums. Double working has undoubtedly advantages in the case of many Pears, and some nurserymen, but not all, give their patrons the benefit of practical experiment in this direction. There is a want of definite and widespread knowledge on a matter so important, and the Station is endeavouring to supply it. Then hybridisation opens up another very wide field. The product of the first crosses is already apparent in batches of sturdy young plants, and further work is mapped out.

That the Duke of Bedford has done a great public service in establishing this Station is beyond question, and so comprehensive is Mr. Spencer Pickering's plan of action that results of great interest can

brittle branches get broken to pieces in the alternate snows and thaws of our winter. I find, however, that it succeeds admirably, and each plant lives for several years, if planted on the perpendicular face of a brick wall with any aspect. The mortar should not be too good, or the courses set too close. Seed is easily obtained, and if sown now, the plants will be ready to be plastered with mud into the crevices in early autumn. When once established it will increase by self-sown seeds. I have it now flowering well on both sides of two walls placed at right angles to one another, and cannot say which point of the compass it prefers to look at. Other plants suited for the same treatment are *Erinus alpinus* and *Saponaria ocyroides*. *C. Wotton Dod, Edge Hall, Malpas.*

## HURSTSIDE, WEST MOLESEY.

This fine old place has obviously taken its name from its proximity to the old Molesey Hurst, which for generations was open to all comers, but converted during recent years into a race-course, and enclosed by a huge black fence. It is situated quite near to the quaint old church of the village, and equally near to the River Thames, the banks of which at this point still retain their old-time beauty. Here, in summer visitors throng in ever-increasing numbers. Hurstside, however, is sufficiently removed from the river itself to enjoy to the full seclusion and quiet in its own domain of seventeen acres or so. A very large proportion of the extent is devoted to pleasure-grounds, in which are flower-beds and borders. The greenswards are rich to a degree. Herbaceous and shrubby borders prevail here also, but these were only springing into life at the time of our visit. There is a large and spacious kitchen-garden, already in a great measure cropped with the earlier requisites of this department. The soil is deep, easily worked, and as is often the case when situated near the bed of a great river, is more than usually rich and fertile, and crops of great excellence are obtained. Perhaps the most interesting feature of the place early in April was the extensive range of glasshouses, erected some years ago by Gray & Sons, of Chelsea. These include several vineries and other houses, erected in pitch-pine, and in convenience of arrangement as well as design these are among the best of the kind we have seen. The range of vineries is excellent in every way, and equally meritorious too are the Grapes that are grown therein. Indeed, high-class Grapes, both for exhibition and home use are produced here in quantity, and the gardener, Mr. G. Elliott, is well known as an exhibitor of ability. In what is known as the early vinery were found examples of Foster's Seedling and Madresfield Court Vines, the latter inarched on the Black Hamburgh. In the Hamburgh-house, besides some half-dozen Black Hamburgh Vines, were also Alnwick Seedling, Foster's Seedling, and Madresfield Court, the first named already giving signs of an abundant crop. The late vinery is devoted mainly to Black Alicante, Gros Colmar, and Gros Maroc.

Peaches and Nectarines are grown in large numbers, some of the trees being of large size and full of excellent bearing wood. Of the former there are in the early-house some fine trees of Violette Hative and Belle de Doué, the latter practically an improved Royal George. A notable specimen of Nectarino Elruge was here also, with a spread of branches 24 feet wide, and about 11 feet in its upward extent. This is one of the very best Nectarines, and as grown here it ripens annually a large crop of its richly-flavoured fruit. For several years past this tree alone has yielded between 400 and 500 fruits, but in 1895 it perfected some 600 fruits of high quality. In the late Peach-house were examples of Sea Eagle, Goshawk, and Golden Eagle, on the front or roof-part of the house; and Barrington and Princess of Wales on the back wall—in the latter position was a good tree of Lord Napier Nectarine. These were all in a distinctly promising condition. Strawberries are largely grown for early and late supplies, the varieties mainly consisting of President and Vicomtesse Héricart du Thury for early work, and other suitable and well known kinds for succession and late crops.

Apart from the fruit-growing and forcing, such necessaries as Cucumbers, Melons, and Beans, are also forced early. Of the latter a new Bean is grown, that appears both in earliness, dwarfness of habit, and productiveness, to be likely to take a prominent place among dwarf Beans for forcing in the future. This variety owes its origin to Mr. Elliott, and is the result of crossing Sutton's Forcing and Sion House. At present only a few plants exist, but compared with other early varieties sown on the same day, the new-comer has all the appearances of an excellent kind.

Until this year Chrysanthemums have been grown extensively and well. For the moment, however, the culture of Chrysanthemums is placed on one side, on account of Mr. Graham's change of residence during the present year. J.

## PLANT NOTES.

CRINUM POWELLI *alias* C. LESEMANNI.

THE *Wiener Illustrirte Garten Zeitung* for April, 1896, contains a coloured plate of a hybrid Crinum raised by Herr H. Lesemann, Vienna, and named in compliment to him by Dr. Günther. The parents are said to be *Amaryllis longiflora* and *Crinum Makoyanum*, and as these are synonyms of *Crinum longifolium* (capense) and C. Moorei, Herr Lesemann has only repeated the cross made by Mr. Powell twenty years ago which produced the well-known C. Powellii, the best of all hardy Crinums. The plate in the *Garten Zeitung* represents what is known in gardens as C. Powellii roseum, the scape bearing an umbel of ten fine rose-coloured flowers. W. W.

## THE WEEK'S WORK.

## THE FLOWER GARDEN.

By HEDLEY WARREN, *Gardener, Aston Clinton, Bucks.*

THE BEDDING-OUT of plants in the flower garden has now commenced in most places, there being a desire to curtail, as soon as possible, the unusual amount of watering that has been necessary of late, of plants still growing in pots. Care should, however, be taken to see not only that the plants are well watered, but also that the soil in the beds is in a moist state before the plants are put out. It is a good plan to well water the beds a few hours previously. This will dispense with watering for at least a few days, except an occasional sprinkle overhead.

ORNAMENTAL GRASSES should be made use of as decorative plants for the lawn and flower garden. Most of these adapt themselves to almost any soil and position, and should be associated with Solanums, Ricinus, Cannas, and other subtropical plants. *Ealalia japonica*, *E. zehriana*, and *E. gracillima*, are exceedingly useful, and there are dwarf-growing kinds as *Briia media*, *Poa*, *Agrostis*, *Festuca elatior*, *Bromus inermis*, and *Avena elatior*.

ANNUALS should be given timely attention in the way of thinning, and they may require frequent waterings during dry weather. It is very important that they should not be crowded together, or the size and general quality of the bloom will be poor, and the duration of the blooming season considerably shortened. Asters, Stocks, Zinnias, and other similar plants may still be pricked off into boxes or borders, where attention may be given them until they are planted out in their final quarters.

HERBACEOUS BORDERS are now becoming gay, and they afford a good supply of cut flowers for decorative work. All plants needing support should be securely staked and tied, before any damage has been sustained. Clumps of the Everlasting Pea may be supported by a few sprays of Birch or Hazel branches, among which they will freely ramble, and find quite sufficient support. Weeding, and the filling of vacancies with annuals and other suitable plants, should also receive attention.

GENERAL WORK.—Climbers in various situations will require to have the growths thinned out, or secured in their proper places. If green-fly, or other insect pests have made their appearance on these, make use of a safe insecticide, and afterwards cleanse with clear water. Clematis montana is one of our best climbers in the shrubby or wild garden, and the flowers are seen to good advantage when growing among the foliage of other trees. Roses at the foot of walls may need a good soaking of water. Add to the water a little artificial manure, or manure-water from the farm. Trees growing near walls are especially liable to get very dry, and then mildew attacks them. At the present time the growths are remarkably clean and strong, and give promise of a fine crop of flowers, some of which are already opening in sheltered positions. If rain should fall, the rolling of walks should be at once attended to, so as to again get them into a firm and perfect condition. Coarse weeds in the lawns should be removed or destroyed. Carnations that are now completing their flower-stems should be supported by stakes, and neatly tied, and thinned if necessary. Violas should be pegged down, and the flowers picked off until the plants have made sufficient growth. Petunias and Verbenas that are intended for bedding purposes, should have the points of their growths removed; or if planted out, peg them to the ground.

## THE HARDY FRUIT GARDEN.

By G. WOODGATE, *Gardener, Rolleston Hall, Burton-on-Trent.*

STRAWBERRY PLANTATIONS, owing to the continued dry weather, should be supplied with copious soakings of water, to assist the plant during the flowering stage, or the crop will be small in quantity and poor in quality. Water taken from cesspools, or from the drainings of the manure-heap, and diluted according to its strength, will do much good; or, failing this, 2 lb. of nitrate of soda should be given to the square rod. Break up the soda finely, so that it can be evenly distributed. Keep it clear from the foliage, and well water afterwards with clear water. Strawberries that have been planted for the purpose of providing runners for fruiting in pots should be relieved of the trusses of bloom as they appear, so that the whole strength of the plant may be concentrated in the production of good strong runners. These will also require to be well supplied with water during the continuance of such dry weather.

GOOSEBERRIES.—A sharp look-out must now be kept for any signs of the caterpillar, and on their first appearance spare no means to destroy them, or much damage to the fruit and to the trees will result. In private gardens, where there is not a great quantity of bushes, the best remedy is hand-picking, and if time is spared for this purpose when the caterpillars are first discovered, much time will be saved, and trouble avoided afterwards.

GENERAL FRUIT TREES.—Young trained trees which were planted during the last season have made a little growth, and now require attention in selecting and securing the young shoots necessary for the formation of a well-balanced foundation. It is very important that no more growths be laid in than are necessary to form the main branches. Pears, Plums, Apricots, and sweet Cherries produce their fruit on spurs, and the distance between the branches should be about 9 inches; should the points of the leading shoots, therefore, exceed 9 inches in distance from each other, another young growth should be laid in, and the same principle carried out, until the whole space is filled. Well-placed shoots for forming fruit-spurs should be stopped at the third leaf, removing all others. Peaches and Nectarines produce their fruit on wood of the preceding season's growth. Sufficient young shoots should be retained that they will average from 4 to 5 inches apart. Morello Cherries require much the same treatment as the Peach and Nectarine, except that they produce a portion of their fruit on spurs. After laying-in sufficient young growths, some of the best-placed fore-right shoots on the older branches should be pinched to form fruiting-spurs. All growths which are not required for the purposes mentioned should be gradually removed, taking away those from the upper part of the trees first. Any leading shoots which show signs of making too strong a growth should have their points taken out, so as to encourage the flow of sap to the weaker portions of the tree.

## PLANTS UNDER GLASS.

By JNO. MCINTYRE, *Gardener, Woodside, Darlington.*

EUCHARIS GRANDIFLORA.—Specimen plants will have completed their growth, and may be removed to a house with a lower temperature to rest, in which state they should be allowed to remain till within one month of the date that they are wanted in flower. To start *Eucharis grandiflora*, place in a warm stove. Where several specimens exist, they can be managed in this manner, and some of them will flower at almost any time of the year. These remarks apply to healthy plants only, for such as are infested with the bulb-mite cannot be relied upon to produce as good results as healthy plants; in fact, if the bulbs become unhealthy, it is almost impossible to get them to flower at all.

THE CONSERVATORY.—Regular attention should be given to creepers on pillars and roofs, regulating the shoots before these get entangled and difficult to regulate without injury. A good number of Fuchsias should now be pushed on for use in the conservatory during the summer. When these beautiful plants are well done, nothing is better for keeping the conservatory gay. Large plants which have had their shoots pinched several times may now be allowed to flower, and one-half of the collection may have the shoots so treated for the last time a fortnight hence. All species of Fuchsias require frequent watering with liquid-manure; that prepared from sheep's dung may be used continuously, even during their flowering season.

**HYDRANGEAS.**—The plants will now be coming into flower in the intermediate-house, and just before the heads expand the plants should be removed to a cooler house, and be occasionally afforded soot-water. Other *Hydrangeas*, of which one of the best is *Dr. Hogg*, come in usefully for various decorative purposes. Some plants of *Hydrangea* should be raised yearly from cuttings, for in this way the finest flowers are obtained. As soon as the plants have finished flowering, cut the shoots back, and allow the plants to break, when abundance of shoots fit for cuttings will be obtainable. Insert the cuttings singly into thumb-pots, and place in the propagating-box. When rooted, shift on at once, into a compost of loam and rough leaf-mould, in equal parts, repeating the re-pottings till they reach 6-inch flower-pots, in which size they are useful for all sorts of purposes. Should the plants become leggy, and dwarf plants are wanted, as soon as they have set their flowers the tops may be taken off 4 or 5 inches long, and rooted; they flower equally as well as older plants.

**STATICES** now pushing up their flower-spikes will require staking, using for this purpose Hazel twigs, which are less stiff than deal stakes. The plants should have applications of liquid-manure from the farm-yard tank twice a week or weaker ones of artificial manure. The best variety to form a specimen is *Statice profusa*; *S. Butcheri*, and *S. Holfordii* are varieties which may be grown for variety. Young plants intended to be grown into specimens should be regularly pinched at the points till a foundation is formed, and not allowed to flower the first year. A compost to suit the plants consists of two parts good fibrous loam, charcoal, lime-rubbish, and a sprinkling of coarse silver-sand.

**THE ORCHID HOUSES.**

By W. H. WHITE, *Orchid Grower, Burford, Dorset.*

**PHAIUS TUBERCULOSUS.**—This beautiful Madagascan species is commencing to grow afresh. Being of scant habit, its leading growths quickly get beyond the limits of the pan or basket, but sufficient space should be allowed for the rhizomes to run their full length, and to allow the roots to spread freely in all directions. Where this plant grows well, the rhizomes grow to a greater length than is desirable, and to prevent the plant becoming unmanageable the leading growths should be severed with about 2 inches of the rhizome attached to it, and put singly or several pieces together in a pan. The divided rhizomes may be laid upon a bed of living sphagnum-moss, where they will soon produce several young plants. The roots do not adhere to the sides of the pot as do some of the epiphytal Orchids, so the plant may be turned out of the pot, the whole soil carefully removed, and the roots perfectly disentangled. Rather large shallow pans are most suitable, and they should be filled to two-thirds of their depth with drainage, secured with a thin layer of moss, and afterwards a thicker layer of peat and sphagnum, with a few lumps of fibry loam intermixed with it. Keep the divided pieces well to the centre of the pan, as they soon make growths towards the outside. Then spread the roots well out and lightly cover them with the soil, to which add a few broken crocks, then fill up close to the rhizomes with clean living sphagnum-moss. After re-potting, place the plants on a low stage in a hot moist corner of the East Indian-house where they will get plenty of air. Water carefully, and at first merely sprinkling the moss to encourage it to grow. Immediately there are new leaves, they must be examined each day for small yellow thrips, and if these insects are seen, treat them with the XL All Vaporiser; it is a remedy preferable to the constant use of sponge or brush, by which tender foliage is easily bruised. Large fleshy scales are sometimes troublesome at this season, but if taken in hand when first seen, and sponged off, they are easily eradicated. *Phaius tuberculatus* is a valuable species for hybridising purposes, several handsome hybrids, as *P. Cooksoni* × *P. amabilis* ×, and *P. Marthe* × having been obtained from it. These hybrids are also commencing to grow, and may be re-potted if necessary. They are deeper rooting than their parent, and pots are preferable to pans. The compost should consist of equal parts yellow turfy loam, rough fibry peat, and chopped sphagnum. Add a few broken crocks, and mix the whole together. Place the plants in a shady position in the warmest house or moist stove. They will require abundance of water at the root throughout the growing season.

**INTERMEDIATE-HOUSE.**—Such *Cymbidiums* as *C. eburneum*, *C. grandiflorum*, *C. giganteum*, *C. Mastersi*, *C. elegans*, *C. Lowii* or *eburneum*, may

now be re-potted. These plants should not be disturbed oftener than is really necessary, therefore give them sufficient space to suffice for several seasons' growth. Use the same fine kind of compost as for *Phaius*, and pot moderately firm, leaving sufficient space below the rim to receive abundant supplies of water during the summer months. Place the plants in a shady position, and they will be less liable to red-spider. Other *Cymbidiums* which grow well in this division are *C. ensifolium*, *C. longifolium*, *C. chloranthum*, *C. aloifolium*, *C. pendulum*, and *C. Lowianum*. The last named species may be re-potted as it passes out of bloom. *C. Devonianum* is an intermediate-growing species, has pendulous flower-racemes, and basket-culture is best for it. The pretty dwarf-growing *C. tigrinum* is generally a difficult species to cultivate, but the warmest end of the cool-house appears to suit it best. A similar position will answer for *Lycaste Skinneri* and its numerous varieties during the summer months. Now that their flowering season is over, the plants may be re-potted into well-drained peat and sphagnum, with a little dried horse-manure added. Great care is necessary not to over-dose the plants with water, as the growths are inclined to decay like the deciduous *Calanthes*. Red-spider must be checked quickly, or it will soon disfigure them; but periodical sponging with soft tepid water will prevent their reproduction.

**THE KITCHEN GARDEN.**

By C. HERRIN, *Gardener, Draymore, Maidstone.*

**CAULIFLOWERS.**—Continue to put out plants that are large enough into their permanent quarters. Such varieties as *Early London* and *Pearl* are more particularly referred to. These should be fit to cut by the end of June, and continue serviceable until *Eclipse* or similar varieties come into use. Before planting dip the roots into a puddle made of clay and soot, about the consistency of thin paint. This practice is useful as a preventive of maggot at the root, and it also helps the plants to become sooner established. Cauliflowers that were planted early have been subjected to very dry and hot weather, and some mulching should be given them. Rotten manure of any kind, or leaf-mould even, will answer for this purpose. When this has been done, give a good watering with a weak solution of sulphate of ammonia, using about a good handful to 3 gals. of water. This will stimulate the plants, and the mulching tending to retain the moisture, the plants will grow rapidly. Seedlings of later kinds on borders must not stand sufficiently long to become drawn before they are thinned. When they are pricked-off into nursery beds, a few branches should be inserted around them to provide a little shade, and if the present dry weather continues, frequent waterings will be necessary.

**CHOU DE BURGHEY.**—Seeds of this useful winter vegetable should now be sown. If this be done during the present month the plants will be ready, as soon as the ground can usually be spared for them. They will be early enough to produce good heads for use during the first three months of the following year, whilst some may be cut earlier. I find this delicate-flavoured Cabbage very useful at the time mentioned, and prefer its flavour to that of any other variety.

**CAPRICUMS** should now be in condition for potting into the pots in which they will fruit, or for planting-out. If a large quantity be required, the latter plan should be adopted, and the plants be put out in moderately rich, firm soil, in frames or pits, with a mild hot-bed. The plants should be 18 inches apart each way, and be kept well syringed until a crop of fruits have set, and ripening commences. If pots are used, those 6 inches in diameter will be large enough, and the plants should be grown in a Melon or Cucurbit-house if a light position can be given them.

**LETTUCE.**—Maintain a constant supply of these. The seed should be sown thinly in rows where they will not need to be transplanted, as this entails much trouble during dry weather. Where Celery trenches have been thrown out, seeds may be sown on the ridges between these. The selected strains of the *Paris White Cos* are excellent summer varieties, and *All the Year Round* is still one of the best Cabbage Lettuces for summer sowing. Lettuces nearly ready to cut should be well supplied with water, to keep them crisp and succulent. *Brown Cos*, from autumn sowings, and *Early Paris Market*, sown in February, are both in good condition now.

**GENERAL WORK.**—During the dry weather hoeing should be done as frequently as possible. Potatoes should be moulded-up as soon as the tops are high enough, and those in frames must not be allowed to get so dry that the skins become firmly set. Mulch and water Peas, especially those from which the earliest pickings are expected. Before these notes are published, I hope to gather from the varieties *May Queen* and *Chelsea Gem*. Beech-sticks should be placed to successional crops, and the tops of the sticks be kept well open, to give the haulm plenty of room. Make further sowings of *Late Queen* and *Ne Plus Ultra*, or other suitable varieties.

**FRUITS UNDER GLASS.**

By W. POPE, *Gardener, Highclere Castle, Newbury.*

**MID-SEASON AND LATER PEACHES AND NECTARINES.**—Those trees which were started in the month of February will, in most instances, have fruits in process of stoning, and should not, therefore, be much excited by having a high degree of warmth afforded them till this period is passed, 55° to 60° at night, and 65° in the daytime by artificial heat will be quite safe temperatures during this period. If it be necessary to have the fruit ripened as quickly as possible, it may be hastened when stoning is completed, a temperature at night of 65° to 70° and by day of 75° being then afforded. The ventilation of the house should begin at the latter figure, and take off early in the afternoon, and damping down copiously, and allowing the thermometer to rise to 90° or 95° for a time. With a fair crop, and trees in good health, the fruit will speedily swell to a large size under this kind of treatment, but before the ripening period commences, the atmospheric moisture should be reduced, and more air given, so as to give good flavour to the fruit. Aged or weakly trees, if bearing freely, should have liquid-manure afforded them frequently, whilst for young or very vigorous trees, clear water will suffice till the stoning is finished, when, if the fruit crops are abundant, manurial aid may be required.

**LATEST HOUSES.**—The trees in these peacheries must have the usual attention in the matter of fruit- and shoot-thinning, and be afforded ventilation freely by day and night, if fruit be wanted very late, other points of management being similar to those given in earlier Calendars. Fire-heat will scarcely be necessary for these trees, but the ventilators may be closed early in the afternoons with sun-heat for an hour or two, and afterwards opened a little, and so remain all night. Examine the inside borders once a week, and when necessary thoroughly water them, as well as the outside border when necessary, mulching with short stable litter.

**MELONS.**—When the fruits on the earliest plants change colour, and in other ways show signs of approaching ripeness, moisture at the root and humidity in the house must be lessened, but not unduly so, or the foliage will flag, and it is important that this be kept fresh and healthy. Ventilate freely, keep the temperature at 70° to 75° artificially, or 85° to 95° with sun-heat. Should any of the fruits crack, afford much less water at the root, and a still drier air. To prevent cracking of the fruit it is a good practice to cut the stem a few inches above the fruit half-way through. Melons should always be cut from the plants a few days before they are fully ripe, and stored in a cool dry room to ripen fully. The growth of plants having immature fruits on them should be encouraged, the laterals thinned, stopped, and secured thinly to the trellis, for the quality of the fruit depends in great measure on the proper development of the leaves. Syringe the plants when closing the house or frame, and sprinkle the floors or the bed, &c., with very weak guano-water once or twice a day. If canker be noticed about the collar of the plant, apply quick-lime to the part, rubbing it in, and keep water away from the stem as much as possible. Melon plants need no shading unless the leaves flag, then it should be as thin as possible, and it should be removed on the decline of the sun or when clouds hide its rays. The Melon plants in pits and frames should be kept in good health and vigour by keeping up a suitable top and bottom-heat by renewals of the dung linings, &c. The fruits should be raised above the leaves by placing them on inverted flower-pots, and the lights should still be covered at night.

**ACTION OF FORMIC ACID ON THE GROWTH OF PLANTS.**—Mr. SEMPLER records in *Nature* the repeated failure of his experiments with this substance, which was stated greatly to promote the growth of plants.

## EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

## APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, MAY 27 { Bath and West of England Agr. Show at St. Albans (5 days).  
Flower Show at Olympia (3 days).  
FRIDAY, MAY 29—Royal Botanic Society: Lecture.

## SALES.

WEDNESDAY, MAY 27 { Important Sale of the Model Fruit Garden and Nursery, at Normandy, near Guildford, by order of the Trustees, by Protheroe & Morris, at the Mart, London.  
Special Sale of Tuberous Begonias, Liliiums, Dahlias, American Roses, Cannas, &c., at Protheroe & Morris Rooms.  
THURSDAY, MAY 28 { Unreserved Annual Sale of Bedding and other Plants, at the Nurseries, Merstham, by order of Mr. F. Ross, by Protheroe & Morris.  
FRIDAY, MAY 29 { Imported and Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK—57°.

BY the time these pages are in the hands of the reader, the "Temple Show" will have become a thing of the past. Its record will certainly be a good one, for though there was nothing startling, and there was a marked want of specimen plants, the general average quality of the exhibits was high. The arrangement was of the usual monotonous type, so that some of the groups occupied precisely the same positions that they did last year, and little, if any, attempt was made to arrange the plants so as to show them to the best advantage. Some improvement was here and there noticeable in the fact that the crowding was not so great as usual, and there was less repetition of common material, but still greatly too much. Again some of the exhibitors, or the authorities of the Society, had the good taste to put the too-often-obtrusive labels where they could be seen without interfering with the view of the plants.

For the details of the show we must refer to our report in another column, but we may here remark that the Roses were unusually beautiful. Mr. MOUNT's specimens from Canterbury showing extraordinary purity and brilliancy of colouring, and the varied uses to which TURNER's Crimson Rambler can be put was well shown in the groups of Mr. TURNER, Messrs. PAUL, and others.

Orchids were less well represented than usual, the abstention of Baron SCHRODER being painfully conspicuous, while the plants shown were small. Sir TREVOR LAWRENCE showed a large and very interesting collection. Messrs. LINDEN showed a remarkable spotted form of *O. crispum* named *augustum*, which won an award, even when there are now so many fine varieties of that species (see fig. 106, p. 649).

Caladiums were shown of a very high degree of excellence, those of Messrs. PEED being specially remarkable for fine cultivation.

Messrs. VEITCH showed a remarkable group of hybrid Phyllocacti, which ought to do some-

thing to bring these gorgeous flowers into public favour.

The rock-gardens of Messrs. BACKHOUSE, PAUL & SON, CHEAL, and others, were delightful oases in the long tents. Messrs. SUTTON's group was an object-lesson for Londoners, who have so few opportunities of seeing how plants grow; and, as presumably the QUEEN has not a much better chance, the exhibit has been accepted by Her Majesty, and will be transferred to Frogmore. New plants were shown by MM. LINDEN of Brussels, and SANDER of St. Albans.

In the open air Messrs. VEITCH had a charming group of hardy flowering shrubs, and a rather large collection of quaint Japanese, crippled Pines.

We hardly expected to find large collections of fruit and vegetables at the Temple Show, but what there were did credit to their exhibitors. Messrs. RIVERS' exhibit of pot-Nectarines deserved high commendation; and Messrs. BUNYARD seem to have some special method of keeping Apples.

A noteworthy feature of this show was the Catalogue, which, in addition to the usual information, contained several clear plans, showing the position of the principal exhibits. This Catalogue will not only be serviceable at the time, but useful for reference hereafter.

The weather was everything that could be desired, though the strong gales of Tuesday and Wednesday nights caused much anxiety and trouble, and so we earnestly hope the Society will reap a substantial advantage, and that its well-earned reputation of nearly a century will be perpetuated for another century to come. The attendance on the first day was larger than ever before.

Much praise must be given to the authorities, who performed their onerous task with marked ability, patience, and courtesy.

The Prince and Princess of WALES, with their daughters, visited the exhibition on Tuesday afternoon on their return from Croydon. During the gale of Wednesday those in charge of the tents and marquees had very great difficulty in preventing their being overturned, and a mishap was happily averted that would have occasioned irretrievable damage to their valuable contents.

TEMPLE SHOW.—We are unable to publish all the illustrations we have of this exhibition this week, next week we shall publish several more. This week we publish more than 2000 extra copies.

OLYMPIA.—Among the attractions of this metropolitan place of amusement, a flower-show of large extent as regarded flowers in season, Caladiums, &c., was held on Saturday, May 16, in a new building entered by a subway from the great building. The chief exhibitors of cut flowers and plants were Messrs. Laing & Son, Forest Hill, S.E.; P. Barr & Sons, Covent Garden, W.C.; H. Howell, Ravenscourt Park, Hammersmith; Thos. Ware; the St. George's Nursery Co., Hanwell; and G. Mount, Canterbury. A considerable addition has been made to the gardens by taking in the area upon which the Irish Exhibition of some years ago was held. This is laid out with long narrow, raised beds, having turfed sides, now filled with Pelargoniums and Marguerites, with Thujas and other Conifers as "stairers," and wide gravelled areas for promenading between. During the summer evenings this should be a much-frequented part, especially now that good music is provided by bands of male and female performers. Horticulture forms a considerable portion of the attractions of the older building, Palms being freely used in what is called the "Palmarium," although it is too much to hope that the plants can remain in health in the semi-darkness of the place.

## THE TREE OF TEN THOUSAND IMAGES.—

In Tibet there grows a tree which excites the religious veneration of the natives by reason of the letters, words, and even sentences which are said to be traced either on the leaves or on the trunk. When the Abbé HUC first brought this tree under notice, his narrative was treated as a traveller's tale. Successive explorers, however, have proved the existence of such a tree, and shown that there is a substantial basis of fact which calls for explanation. M. ENOUARD BLANC has received from a lama two specimens taken from the Sacred Tree in the north of Tibet, and on the bark of which Tibetan characters are perfectly legible, forming "not only words but pious ejaculations, and even prayers!" M. BLANC describes the specimens in the last part of the *Bulletin of the Botanical Society of France* (1896, p. 61). Three explanations have been offered: 1, that the markings are purely fortuitous, like the *ATAI* of the Martagon; 2, insect agency; 3, a priestly trick. The last hypothesis is supported by the regularity and perfectness of the characters, and by the circumstance that the monasteries derive a considerable revenue from the holy tree. The tree has been considered to be *Ligustrina amurensis*. Others refer it to some species of *Morus*, or *Broussonetia*.

## TRANSPIRATION AS A GUIDE TO CULTIVATION.

—M. H. MÜLLER-THURGAN, in *Weinbau und Weinhandel*, 1895, Nos. 5 and 6, contributes a paper on the "Amount of Transpiration of Plants as a Guide to their Cultivation." The following is a summary of the conclusions arrived at, as cited in the *Annales Agronomiques*, March, 1896.—Three conditions chiefly have an influence on transpiration. There is, first, the quantity of water fallen during the growing period. There is also the moisture of the air. Trees with delicate leaves, well adapted to the function of transpiration, do not, under any circumstances, prosper in regions where the atmosphere is deficient in moisture. The movement of the air must be considered. When the air is very calm transpiration is slight, even if it is dry, because each leaf is surrounded by an atmosphere saturated with watery vapour. If the wind blows, this layer of watery vapour is unceasingly evaporated, it happens that the amount of humidity in the air remaining the same, transpiration may be greatly increased. These conclusions of the author are deduced from comparative observations of plantations of fruit trees and experimental researches which prove how great are the differences between different kinds of fruit trees as regards protection against transpiration. The leaves of the Pear transpire less than the leaves of the Apple; it is no doubt for this reason that Apples withstand a long drought badly, and require screening from the wind. Much of the ill-success, the cause of which has hitherto been sought for in plantations of trees, may be attributed to the disturbance of the equilibrium between transpiration and absorption. The amount of the transpiration should furnish an excellent way of discovering if any variety can be profitably cultivated. Much costly experience could thus be saved. A simple method of estimating the variations of the transpiration would be to calculate the progressive loss of water by successively weighing the cut leaves.

COTTON-SEED OIL.—It is stated in a report from New Orleans that in 1859 there were a few small mills making Cotton-seed products worth, perhaps, £1,000,000. Now the trade uses a capital of near £3,000,000, and makes a product worth over £14,000,000. The material consumed was regarded as worthless in 1861. In 1892-93 the price was £3 10s. per ton, but fell to about £3 per ton or under. In 1894-95, owing to the largeness of the Cotton crop, the price fell to less than £2 a ton. There are some 300 mills manufacturing Cotton-oil from the seed. The value of the foreign business in 1895 amounted to over a million. The greatest demand comes from Great Britain.

## DICTIONNAIRE PRATIQUE D'HORTICULTURE.—

The third volume is now completed, the volume ending somewhat awkwardly with the word "Penée."

FIG. 105.—MESSRS. SANDER'S GROUP OF ORCHIDS, AS STAGED AT THE TEMPLE SHOW. (SEE ORCHID COMMITTEE, P. 626.)

**PHOTOGRAPHY IN COLOURS.**—Our French contemporary, *Le Jardin*, published in its issue for May 5 a photographic illustration in colours of *Cypripedium callosum*—a very promising beginning, on which we venture to congratulate our contemporary.

**A NEW CAMPANULA.**—M. ALBOFF has discovered in the Caucasus a new species of Campanula, which, according to the report in *Nature*, so much exceeds all known species of the genus by its beauty, that M. ALBOFF proposes for it the name of *C. regia*, and remarks that its general shape so much differs from that of all other now living Campanulas, that it must be without doubt a remainder from a foregone geological flora.

**DEVON AND EXETER GARDENERS' ASSOCIATION.**—The Committee have fixed the third Wednesday in July (15) as the date of the summer outing for the year. The following is the programme as arranged:—To meet at Bedford Circus at 8 A.M., and proceed *via* Countess Weir, to Powderham; passing through the Castle gardens, the American garden, and pleasure-grounds, the party will rejoin the breaks, and proceed *via* Starcross and Dawlish to Teignmouth. At Teignmouth a visit will be paid to the Jadoo factory at the Quay, and to the gardens and conservatories of Col. HALFORD THOMPSON. The party will then be entertained to luncheon by Col. THOMPSON, at Eastcliff. Leaving by way of Shaldon Bridge, the drive will be continued to Torquay. The return journey being made from Torquay for Exeter direct, *via* Newton Abbot, Chudleigh, and Kenford, leaving the "Torbay" at 7 o'clock. No tickets can be obtained after Friday, July 10.

**COLLECTION OF DRUGS AT THE BERLIN INDUSTRIAL EXHIBITION.**—Those of our readers who intend to visit the exhibition now being held in Berlin will be interested to know that the firm of BRÜCKNER, LAMPE & Co., of that city, display in the scientific portion, in Group XXII. (Horticulture), a number of rare living examples of medicinal plants and original trade packages. The collection having been commenced more than a hundred years ago, and continually received additions, its inspection will have much interest for all persons engaged as pharmacists, doctors, chemists, dealers in drugs, &c. The published catalogue of the entire collection comprised, in the year 1893, more than 3000 objects.

**DOUBLE PEAR.**—Mr. HORNE kindly sends us a double flower of the Duck's Egg Pear. It is a pretty little, thoroughly double flower, not at all suitable as "a market Pear," as no fruit is produced.

**BRANCHING TULIP.**—Messrs. BARR & SON send us a Tulip with eight flowers from a single stalk. We have never seen so many before. The bulb will be kept under observation to see if it will repeat the performance.

**THE WEATHER IN THE NORTH OF SCOTLAND.**—The long period of fine dry weather experienced came to an end on Thursday, the 14th inst., when rain fell at intervals. Every day since there have been slight showers. Monday, 18th, was a glorious day for the country. Throughout the whole day heavy showers of rain fell, which gave much-needed relief to those who cultivate thin and sandy soils. Vegetation of all kinds has derived immense benefit from the grateful rainfall, and it has just come in time to prevent the drought doing serious damage. Gardeners in the North have been more fortunate in this respect than their southern brethren, whose crops have suffered considerably by the prolonged drought. The whole countryside is now looking refreshed and beautiful.

**SHIRLEY AND SURROUNDING DISTRICTS GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.**—The monthly meeting was held on the 18th inst. at the Parish Room, Shirley, Southampton, G. T. HARPER, Esq., J.P., presiding, there being a good attendance of the members. "Fertilisation of Flowers" was the subject provided for the evening, and the lecture was

given by Mr. W. F. PERKINS, illustrated by lime-light with slides specially prepared for him by Mr. J. Hornell, of the Biological Laboratory, Jersey. The illustrations embraced each method of fertilisation, and included a large number of flowers, showing most effectively the surprising number and ingenuity of the devices of Nature for securing the desired object, and which were fully explained by the lecturer. On the proposition of the Chairman, seconded by Mr. W. F. Mayoss, a hearty vote of thanks was accorded Mr. Perkins for his interesting and instructive address. There was a good exhibition of cut blooms of American shrubs, &c., contributed by Mr. W. H. Rogers, Red Lodge Nursery; Grapes, by Mr. W. Perkins; Orchids, by the chairman; Orchids and Pansies, by Mr. C. G. Stuart Menteth, J.P.; Peas, by Mr. J. K. Allen; and hardy flowers, by Mr. B. Ladhams. A hearty vote of thanks was accorded to the chairman and the exhibitors at the close of the meeting.

**THE SURVEYORS' INSTITUTION.**—The adjourned discussion on the paper read by Mr. R. M. D. SANDERS (Fellow), at the meeting of November 25, 1895, entitled "Landlord and Tenant in Ireland," was resumed, and, after a long debate, concluded. The annual general meeting of the Institution, to receive the report of the Council, and the announcement of the result of the election of officers for the ensuing year, will be held on Monday, June 1, at 3 o'clock. The prizes awarded to successful candidates, in connection with the recent preliminary and professional examinations, will be presented by the President at the annual general meeting.

**TASMANIAN FRUITS.**—The Peninsular and Oriental Company's steamer arrived at the Albert Dock on the 19th inst., having on board 20,968 boxes of Apples from Hobart, 1991 boxes of fruit from Melbourne, and 134 boxes from Adelaide, making in all 23,093 boxes.

**VEGETATION IN A VITIATED ATMOSPHERE.**—According to the *Revue Scientifique*, M. LOUIS MANOIN lately published the results of a series of experiments on the composition of the air in the soil in those streets of Paris which are planted, and where it is, presumably, vitiated by excess of carbonic acid and diminution of oxygen. He has, since then, experimented upon the influence upon growing plants of an atmosphere rich in carbonic acid and poor in oxygen. The results of his first trials, made in winter on seeds and tubers, show: 1st, a diminution of respiratory activity, the consequence of which is a distinct retardation of growth; 2nd, modifications of the respiratory phenomenon characterised by an alteration in the nature of the phenomena of oxidation, as the proportion  $\frac{CO_2}{O}$  in the gases absorbed or expelled increases in specimens kept in an atmosphere rich in carbonic acid and poor in oxygen.

**THE OPENING OF GENOTHERA FLOWERS.**—M. E. ROZE has contributed to the *Bulletin de la Société Botanique de France* the results of his experiments on the expansion of the blossoms of *Genothera suaveolens*. The object of the experimenter was to discover, if possible, the causes producing and the effects resulting from the well-known sudden expansion of the corolla and reflexion of the sepals. M. ROZE, after carefully perforating, gashing, and otherwise in various ways hastening or retarding the development of many different buds and flowers, did not satisfy himself that the thick rim in the throat of the calyx was possessed of much influence; microscopic examination showed little, and did not prove that the phenomenon was excited by any internal development of the flower. The cause of the sudden expansion of the buds must therefore be sought externally, and is due to moisture, either liquid or in the form of vapour, and operating in the evening with a force proportionate to the amount of heat to which the plant was exposed during the preceding day. The turgescence of the tissues of *Genothera* flowers, which is the cause of their abrupt expansion, is itself the result of warmth during the day, succeeded by moisture of the atmosphere in the evening.

**HEALING OF INCISIONS IN VEGETABLE TISSUES.**—"Mr. S. G. SHATTOCK read, on May 5, before the Pathological Society of London, a communication on this subject, giving a detailed account of the different methods as studied experimentally by himself. The methods were comparable to those of first intention and third intention in the human subject. The author commenced by adverting to the process of 'immediate union,' which assumed the reunion of the parts of cells actually divided. He had never observed this in plants, in spite of every care; and he did not believe that it took place in animal tissues, even in the case of so simple a cell as a leucocyte, for HOFER had shown that if an amoeba were divided, two individuals resulted, of which the one wanting the nucleus after a while perished. Under healing of incision in plants by first intention, the author stated that in general it consisted in cell-division on either side of the face or plane of the injury; the remains of the cells laid open in the course of the incision became compressed, and as growth proceeded the line of these adpressed remnants was interrupted or broken into segments by the interpolation of new cells. This was the most perfect process, occurring without separation of the surfaces. Starch shed into the incision from the opened cells remained unchanged, doubtless because it was no longer in contact with living protoplasm; and its fate contrasted with that in slowly-dying branches, from which it was removed for consumption elsewhere, as happened in the life of ordinary foliage leaves. Sometimes the faces of the incision were separated by tension; the gap was then filled up by the growth of large callus-cells from those bounding it. These callus-cells might undergo secondary thickening, but no cork tissue was produced if the wound was sealed from the air, and it was upon this distinction that the author made the division into healing by first and healing by third intention. In the petioles of *Rheum rhaponticum* a coagulable latex was shed into and filled the wound, and it hindered union, just as blood clot does in animal textures. Under third intent on was considered the case where two surfaces were freely exposed and frequently coalesced. Each of the surfaces under such circumstances healed by the formation of a stratified layer of cork; but when they at length met, seeing that no further physiological reason existed for a protective production of cork, the latter was broken through by the subjacent parenchyma, which thus becomes continuous. This process occurred as the final stage in the well-known method by which deuded wood was covered over by callus in exogenous shrubs and trees; and it was commonly seen in grafting, where no union took place between the cut surfaces, but between the callus from the cambium of the stock and scion. The analogy with the human process, however, differed in this, that the two surfaces were first healed by cork, whilst in animal tissues they remained granulating till brought together. The investigation had a further interest in that its results coincided with what was now generally held of animal tissues, namely, that in repair of common connective tissue the scar tissue was developed from the connective corpuscles, the leucocytes taking no part in its formation." *From the British Medical Journal, May 9.*

**NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.**—The monthly meeting of this society was held at their rooms, 25, Westgate Road, on Tuesday, May 18. There was a good attendance of members, presided over by the chairman, Mr. JOHN BULLOCK. Mr. D. N. MACKIE, gr., Shorbridge, Warkworth, read an able paper on "Stove Plants," including *Crotons*, *Dracenas*, *Pandanus*, *Anthuriums*, *Caladiums*, *Diefenbachias*, *Aralias*, and others, embracing their various modes of propagation and general culture. An excellent discussion ensued, in which many took part.

**CRDYDDN.**—We are informed that on the occasion of the visit of the Prince and Princess of Wales to Croydon on Tuesday last to open the new municipal buildings, the floral decorations of the reception rooms for the Royal party, as well as the railway station, were undertaken by Mr. JOHN R. BOX.

Begonias were largely employed, together with Roses, Orchids, Caladiums, &c., and afforded great satisfaction to all concerned. Mr. Box also had a magnificent group of Begonias at the Temple Show, which was visited by the Royal party on their return to town from Croydon.

### SOME VEGETABLE PRODUCTS OF PERSIA.

In some recently-issued reports on the trade and commerce of Ispahan, Yezd, and the Kerman Conular district, some interesting facts are given in relation to vegetable products under cultivation in the above districts of Persia. The cultivation and preparation of opium is described as by no means a small or unimportant industry in Ispahan, where almost every native or European merchant who trades in the drug sees it prepared under his own eye. The collection commences early in May; the Poppy-head is lanced in the afternoon, and the opium which exudes

about a quarter of a pound weight, and keeps kneading it on the board and manipulating it with the implement as already described, until it dries up to the standard degree, and assumes a somewhat golden colour. It is then collected, and made up into cakes of 1 lb. each; after a couple of days these are wrapped up in pink paper, and tied round with string, then put into tin boxes, packed in layers with Poppy-chaff, so that the cakes do not roll about; then again packed into wooden boxes, the boxes covered with hide and gunny, and the opium is ready for exportation. If the drug is prepared in cold weather, it has to be dried in the beginning by artificial warmth, and by rubbing on the board, and keeping the boards while in manipulation near a charcoal fire.

The local produce of opium in Yezd has for some years past been a partial failure. The cause of this is assigned to unexpected rains when the sap was gathering, causing the juice to be washed away; to unseasonable winds, which blew the Poppy-heads off before they were ready for the incisor's knife; and to

ness, have felt disinclined to smoke, and the sudden cessation of their chief nourishment has proved fatal. An opium smoker exposes himself to innumerable dangers, but on the other hand he is usually fully aware of their nature, and his opium is his first thought. The Yezd smokers collect the burnt opium off their pipes, and this blackened refuse finds a ready sale in Khorassan, where it is smoked by those who have fallen to the very lowest depths of its indulgence, and are past redemption. Those who do not smoke, eat the drug in the form of pills, of one six-hundredth of an ounce each." In South-eastern Persia the habit of opium smoking is said to be greatly on the increase, women especially indulging in the narcotic.

Almonds are exported from Yezd to Bombay in very large quantities: last year as many as 2,509,000 lb. were sent; they are usually exported in the shells, but the kernels alone also find exporters. The Bitter Almond is the most extensively grown.

Asafetida was exported during the year to the extent of 130,000 lb. There is no local use for this article; its medicinal qualities are not understood; and as a seasoning, it is not fancied as in some parts of the East.

Of Rose-oil, only 1000 miskals, or 140 oz., were exported. There being such a small demand for this perfume, not more was made; the district is capable, however, of producing annually ten times the above amount.

An important industry in Yezd is said to be the grinding of Henna and Ring, the two dyes used all over the East in the adornment of the person. The nails, hands, feet and hair, all receive attention; and in Persia the venerable grey beard is a rarity, being supplanted by bright red or black beards.

Henna is the powdered leaves of *Lawsonia inermis*, the properties of which are well known. It is used in some places for dyeing woollen fabrics yellow or brown, but in Yezd it is not yet used for this purpose. Some 250 maas of the leaf were imported during the year. The plant grows wild in the Bam district.

Ring is an annual cultivated in the same district; it produces a deep black dye, and is the hair-dye of the country. During the year 30,000 maas were imported into Yezd. [The plant referred to is probably a species of *Indigofera*. The name Ring or Rang means colour or dye-stuff.] The treatment of both these dyes is identically the same. The leaf is crushed in mills, which form a distinct feature of the Yezd life. There are thirty-five of these mills in the town, with an average of two stones each. The stones, which are cut from flint-bearing rock, are brought from the mountains near Mehriz, some 36 miles distance; they are usually very large, 8 feet diameter by 1½ to 2 feet deep, every wheel requires two of these, one flat and the other upright, while the latter is revolved slowly by a camel. Each stone will crush 25 maas of Henna daily, and requires three camels for a day's work. When ground into a fine powder, the Henna is packed into bags of 25 drams each, and is exported to all parts of Persia and the Caucasus. The whole system is so laborious and slow, that it is surprising that some simpler form of mill has not been thought of. Some easier form of crushing-machine would, no doubt, be acceptable to the people, but it would still have to be worked by animal power, as fuel for the production of steam is not available. The cheapest quality Henna finds its way into the wilds of Kurdistan, and the finest into the palaces of Teheran.

Dates, we are told, grow to great perfection in many parts of the country, notably at Pabraj and Fanooh. The output could be easily doubled by planting fresh Palm groves. Date Palms begin to yield at three years, and reach their prime at thirty. A good crop from a single tree is estimated at from 80 to 100 lb. They are fertilised by hand, one male tree supplying pollen for perhaps forty female. The Dates used for export are those that grow at the summit of the tree. From the action of the sun they become hard and dry, thus being easily packed. The lower branches remain soft, and are kept for local consumption.

FIG. 106.—*ODONTOGLOSSUM CRISPUM* VAR. *AUGUSTUM* (LINDEN), AT THE TEMPLE SHOW.  
(See Orchid Committee, p. 654.)

and dries during the night is collected into copper pots early the following morning. The opium gathered is kept in store until it is required to be prepared, in thick earthenware or copper pots. Only those hands who have a special knowledge of crude opium are engaged in its manipulation. When the opium is required for preparation, it is taken out of the pots and assorted, and is next put into a very large copper-pot (as the quality of various villages give different "touch" and morphia), for this reason, they are obliged to mix the bulk together, so that all the cakes should be of one quality. Each manipulator has a smooth board about 23 inches long, and 11 inches broad. He takes from the bulk about 1 lb. of the crude opium, and rubs it on the board, puts it in the sun for about ten minutes, and afterwards takes it into the shade and rubs it continuously on the same board with an iron implement having a wooden handle, something like a small solid spade, and continues in the same manner until it dries up to a certain degree; it is then collected together in a mass sufficient for about a day's work, and then heated over a slow charcoal fire, in trays, until it becomes plastic. Again each man takes

a species of worm which attacks the roots of the plants, and prevents growth. The Yezd opium is considered a very good quality, and as it has a special name in Persia, quantities of opium are imported into Yezd from Ispahan, Hamadan, and Khorassan in the raw state, and after preparation are exported under the name of Yezd opium.

During the past year, some 3000 maas (a mau equals about 6½ lb.) were prepared in sticks for Persian consumption. This form of the prepared drug is very carefully made in Yezd, and is much preferred in other towns to their own preparations. The opium-sticks appear to be unknown in the China market; the quality, however, is superior to the cake preparations. The Yezdis are very great opium smokers, and the Consul says:—"Amongst my acquaintances I have many inveterate smokers, who are by far the most active in their movements, and good men of business. On the other hand, one often sees the dull sleepy-looking imbecile reduced to such by a too frequent enjoyment of the opium pipe. I have known deaths from what would appear very slight causes, but on investigation prove to have been those of confirmed opium smokers who, under the effects of ill-

## SOCIETIES.

ROYAL HORTICULTURAL.  
THE TEMPLE SHOW.

MAY 19, 20, 21.—The ninth consecutive show, held under the auspices of the Royal Horticultural Society in the gardens of the Inner Temple, commenced on Tuesday last, and remained open until Thursday evening. The general quality of this show for some years past, the splendid demonstration of present-day horticulture it always presents, and the popularity of the exhibition from the visitors' point of view, have been most satisfactory. Beyond this there is but little to add regarding the exhibition just closed. It was a magnificent display, but judged by such exhibitions as have preceded it upon the same site, it can hardly be said that there has been any decided improvement or extension. It may be regarded with satisfaction, however, that there has been no falling off in the attractions of the show, for it shows considerable tact and energy upon the part of the society's officers that such an exhibition can be maintained at its present degree of development. One fact may be borne in mind in regard to the show from the exhibitors' point of view. So long as the Council feel compelled to keep the exhibits for three days in order to make the fixture a financial success, so long will there be some little reluctance on the part of exhibitors to subject their choicest and most delicate plants to the inevitable risk of injury. Perhaps the absence of the collection of Orchids usually exhibited by Baron Sir Henry Schroder may be thus explained.

Whilst the exhibition was of decidedly good quality throughout, a gardener visiting it may be struck by the fact that there were no exhibits of preponderating importance that stamped themselves as especial features of the show. No really new departure in the method of exhibiting or arranging the plants could be noticed, and probably little in this way is possible unless greater space was at command. Owing to the limited space in the tents for the display of exhibits, the Society were obliged to curtail by about one-third the space applied for by exhibitors. Altogether the tents afforded about 12,000 square feet of tabling space, and this was fully utilised. Some of the groups are figured in the present issue, and others will be given in subsequent issues.

Certificates and Awards of Merit to new or rare plants were dispensed by the several committees, and the relative value of the groups were judged by the following gentlemen:—

*Orchids*: Messrs. Thos. Statter, Jas. Douglas, and E. Hill. *Plants in bloom (Orchids excluded)*: Messrs. J. T. Bennett-Poë, John Laing, and J. H. Fitt. *Groups and foliage plants*: Messrs. Owen Thomas, Jas. Hudson, and E. Molyneux. *Cut flowers, table decorations, and bouquets*: Rev. G. H. Engleheart, Messrs. H. Herbst, and J. Walker. *Fruits and vegetables*: Messrs. H. Balderson, A. F. Barron, and Jos. Cheal.

## Floral Committee.

*Present*: W. Marshall, Esq., in the chair; and Messrs. H. J. Jones, R. Dean, J. Laing, S. A. de Graaf, J. H. Fitt, R. Owen, W. Bain, J. Fraser, C. Jeffries, H. B. May, C. Bliok, C. E. Shea, E. Beckett, G. Stevens, R. M. Hogg, J. Hudson, E. Molyneux, C. J. Salter, J. Jennings, J. F. McLeod, J. Walker, H. Herbst, and J. Fraser.

## CALADIUMS.

The groups of these plants made an almost overpowering mass of brilliant colour in the large tent, and in point of rarity of varieties, varied and vivid colours, those of Messrs. J. Peep & Son, Roupell Park Nurseries, took the leading place. Their plants were excellently grown, varying in height from about 1 foot in that of M. Léon Say to 3 feet in Charlemagne, and some others. The first variety we have named has leaves 9 inches long, and 6 inches broad, pale carmine, with deeper-coloured veins, on which some white spots are sparingly shown. Duchess of Teck, although of the same height and general contour as the last, is the reverse of it in colour, the leaves being opaque, white, greenish towards the edges. An Award of Merit was made to this variety. Madame Léon Say has a leaf lighter in colour than Léon Say, a wavy surface and a lighter coloured margin. Argentine somewhat resembles Duchess of Teck; Raymond Lenoir has a grand leaf, crimson-coloured in respect to its central area, with a margin of creamy-white averaging 2½ inches in width. Louis Van Houtte has a large leaf of deep crimson, and the plant is likely to grow to large dimensions. Michael Buchner has a leaf of a shade of crimson, which is mottled slightly with green, and the ribs are of bright crimson; the habit is dwarf. B. S. Williams is crimson, veined and bordered with green, with ribs of a deeper shade of crimson; it is a fine thing. John Laing, light green and crimson, and Rose Laing, greenish-

white, with a suffusion of carmine, are pretty varieties, and worthy of the notice of growers. Roncador, scarlet ground colour, with all the ribs and veining coloured green, is an exquisitely-finished leaf, and the height of the plant shown was about 2 feet, the blade of the leaf 10 inches long and 8 wide. The new old Minus rubescens, a small-foliaged variety, a companion plant to argyrites, colours green and scarlet, was remarked in one or two examples. L'Insolite has leaves of a cheerful colour, mostly green, with a few light crimson dots and veins of the same colour. Madame Groult in general appearance resembles Roncador, excepting that the ground-colour is white, and the main ribs crimson, and veining green. Candidum is very distinct, having green veining and ribs, on a ground of white. Madame Mitjana is a massive-looking large leaf of crimson, with a purple tinge in it, and bright red ribs. Madame J. Box, a commendable variety, seems to lack methodical arrangement of the chief colours—green and crimson. M. A. Hardy, Auguste Carpentier, Charlemagne, Sanchonathon, Mrs. Harry Veitch, Excellent, Duchess de Mortinair, and Assuaguay, are varieties that have only to be seen to be admired for their beauty of colouring.

We must not omit to mention Le Nain Rouge, President de la Devauxaye, Marie Duhal, Duke of Teck, His Rouge, amongst varieties of dwarf habit, and very suitable plants for anyone provided with a hothouse, and who has much table decorative material to supply.

Messrs. J. Veitch & Sons, Royal Exotic Nurseries, Chelsea, S.W., showed a handsome, evenly-graded bank of large and small plants, the intermediate spaces being filled with Maidenhair Ferns. Amongst them many choice novelties were remarked. It was, as a group of plants, undoubtedly the best set up, although opinions differed as to whether it should be considered the best in regard to choiceness of the varieties and fine culture. Awards of Merit were meted out to Sir Julian Goldsmid, a large-leaved variety, with a ground-colour of white densely veined and ribbed with crimson; to Duchess of Connaught, a medium-sized leaf of greenish white, with a thin edge of green, and faint pink-coloured ribs; and to Silver Cloud, a white leaf with a faint rosy tint and spot of carmine where the stem joined the leaf. Lord Derby had a leaf which looked like an old-fashioned pattern in chintz; the ribs of this one are coloured green, as also the narrow edge of the leaf; Leonard Bause, a very showy variety. For a fuller description of the capital lot of varieties, we refer our readers for an account of the varieties shown to our issue for May 9, p. 583.

Messrs. JOHN LAING & SONS, Nurseries, Forest Hill, London, S.E., had a group equalling in size the foregoing, and generally larger specimens. The firm, as most of our readers are aware, has made Caladium culture a speciality of recent years, and some of the older varieties shown were therefore of large size. We noted Cléo, a showy leaf, with mottlings and blotchings of pink on a ground-colour of green; the plant, together with the pot, was 4 feet high. Somewhat less tall was a fine piece of Mrs. H. Veitch. Another of Leopold Robert, a pretty leaf of white ground colour, pink ribs, and minute green veining; Gaspar Crayer, a blood-coloured leaf of a very large size; Barao Namore, white, with ribs conspicuous for their deep crimson colour and breadth; Triomphe de Conte, crimson and green; Baron Adolphe de Rothschild, of dull crimson in various shades, with pink spotting. Of dwarf varieties we may mention Michael Buchner and Madame d'Halloy.

A group of small plants, consisting of modern and old varieties, was staged by Messrs. HENRY LOW & CO., Nurseries, Upper Clapton, N.E. Beside many that we have noticed in the foregoing collections, were Rio de Janeiro, with crimson ribs, a pink ground colour, isolated dots of the same colour surrounding the central area of the blade, which latter possessed a green edge; Roi de Danemark, Madame Mitjana, John Peed, a large leaf of crimson and green; Crystal, with a semi-transparent leaf of greenish-white; Peripet, green, mottled with white, and with rose-red ribs. Small plants of Aloecia Loxley var. grande, an improved form, were remarked in this group; and a row of C. argyrites formed the edging.

## ANTHURIUMS.

JOHN LAING & SONS, Forest Hill, showed A. triumphans, an apparently free and tall-growing variety, with a spathe of a peculiar shade of pink, and a yellowish spadix—a new variety, obtaining a First-class Certificate. They also showed a few plants of A. Soberzerianum in variety; A. Duvicarianum, a white spathe variety.

MESSRS. F. SANDER & CO., St Albans, exhibited Anthurium Rothschildianum, A. Soberzerianum in variety, but nothing of superlative degree of merit.

## CROTONS.

Codiaeums in variety were observed in a group of miscellaneous plants set up by Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, including C. Aigburth Gem, recurved leaves, ½ inch wide, yellow and green in colour when young, but changing to red, yellow, and green when aged; C. Golden Ring, a spirally twisted, narrow, pendent leaf; C. Warreni, C. Emperor Alexander, broad mottled leaf of green and yellow, margined with carmine when aged; C. Baron Frank Selliere has broad green leaves, with a central white rib and white veins running at right angles from it, the leaves taking a slightly twisted form when young.

Messrs. H. LOW, Upper Clapton, had a group of small plants, of which C. Thompsoni, with much yellow in the leaf, which is broad and long; C. Russellii, green with yellow, in considerable mass of yellow colour running down each side of the midrib; C. chrysophylla, a distinct-looking variety, with a broad leaf part green and part yellow; C. Flamingo,

the young leaves chiefly yellow and green, which change to dark green, with a rosy-red midrib, bordered with a yellow line. Other varieties consisted of Disraeli, Musarcus, Chelsooi, Weismanni, Lord Derby, &c.

## MAPLES.

THOS. CHIFFS & SON, Tunbridge Wells Nurseries, showed Japanese Maples in good-sized examples of good colour, and otherwise well cultivated in pots. We may mention very meritorious Acer palmatum var. sanguineum, A. p. roseum marginatum, A. p. atropurpureum, A. p. dissectum, A. p. involutum, A. p. septemlobum, A. p. flavescens, A. p. palmatifidum, and others; A. japonicum aureum, and A. j. vitaeifolium.

Messrs. W. FROMOW & SONS, Sutton Court Nursery, Chiswick, W., had a large group in the open air, consisting of varieties of Acer palmatum, viz., discolor variegatum, a delicate-looking leaf in white, green, and pink; Sanguineum, Sanguineum variegatum dissectum purpureum, dissectum ornatum palmatifidum, linearifolium atropurpureum, and others. Of Acer japonicum we remarked the distinct looking palmatum with light-green elegant foliage and A. j. aureum. This group of Messrs. Fromow was relieved by a few Lirium longifolium being distributed through it, and it was edged with Eurya latifolia.

Messrs. J. VEITCH & SONS showed two beds of Acers, the plants being sunk in the soil, one bed containing A. palmatum palmatifidum and A. p. sanguineum. The other bed consisted of A. palmatum dissectum. The varieties of Acer from Japan have great apparent capabilities, and this year the colours seem particularly bright, and the season so far has suited them.

## CONIFERS.

Messrs. J. VEITCH & SONS exhibited a number of Japanese Conifers, very old and courted, but not measuring in any instance more than 2½ feet in height. We may note two specimens of Podocarpus macrophyllus variegatus, several of Retinospora obtusa aurea, generally in good health; two of Pinus parviflora. Podocarpus Nageia also variegatus, a species with ovate leaves 2½ inches long, 1½ inch wide. Many of these Conifers are believed to be one hundred years old. This same bed contained baskets filled with small plants of Japanese Acers. Each bed was edged with plants of the pretty variegated Eurya latifolia.

## BEGONIAS.

*Tuberous-rooted*.—These were distributed in groups through two or more of the long marquees, being collectively a marked advance on previous years, the grouping being carried out more effectively; whilst from the point of quality, no possible fault could be found.

Mr. JOHN R. BOX of Croydon showed a large and very varied group of considerable length, in which the quality was remarkably good, the flowers of large size, whilst the colours were distinct and good; the foliage, too, was dark in colour, and the growth robust and sturdy; both doubles and singles were equally good. The most notable were the single yellows, the crimines, and dark crimines; and the double apricot, primrose and buff-tinted forms; Brilliant, an extra-large crimson scarlet, was very notable (a Silver-gilt Flora Medal was awarded to this group).

Messrs. JOHN LAING & SONS, of Forest Hill, showed another very extensive group in their characteristic style, by the association of several plants of one shade of colour in distinct small groups, the effect being thereby greatly enhanced. The growth here also was excellent, and the plants well flowered. Very notable were the Duchess of York, a fine double Primrose coloured variety; Duke of Fife, a fine double rose colour; and Duchess of Fife, a double pale yellow, as well as another, a single, called The Giant, orange-scarlet in colour, and of large size; pure white and scarlet doubles, and crimson shaded singles also abounded.

Mr. T. S. WARE, of Tottenham, had a small group of select varieties, the plants of extra size and vigour, the best of these were the named varieties, viz., of doubles, Miss Bertha Joseph, a fine clear yellow; Maid of Kent, double rose colour; Duke of York, extra large double crimson-scarlet; and Princess of Wales, a soft blush; and of singles, Pride of Buxley, pure white, extra large; Champion, bright orange; Merrill, dark blood-red; and Goliath, orange and buff tinted.

Another, and a remarkably varied, well-grown and well-arranged group, came from Mr. H. J. JONES, Lewisham. This group was lightened by the addition of several plants of Asparagus tenuissimus, interspersed here and there, whilst another feature was the stout erect footstalks; the growth, too, was distinctly robust. The best single kinds were Golden Queen, a pale golden yellow; Rose Queen, a deep rose, of fine form; Miss Helmer, rosy pink, of extra quality; Delicatum, a very soft blush pink; and Miss Blundell Maple, a rich orange colour; the double varieties, too, were of excellent quality.

Begonias (semperflores section). These were to be seen included in the comprehensive group of Messrs. STURTON & SONS, each kind being arranged en masse in baskets, and with decidedly good effect, most noteworthy here were Princess Maude, rose-pink, dwarf; Princess Louise, pale flesh coloured; Princess May, pale pink; Duchess of Edinburgh, pale pink and white, of large size; and Coral Gem, pale coral-red, large.

## ORNAMENTAL LEAVED VARIETIES.

Messrs. F. SANDER & CO. showed Charlotte Sallier, a dwarf variety with small leaves of a uniform silvery colour; B. Pride of Castlewellm, resembling B. Rex in the leaf-markings but even prettier; B. Madame Louise Fournier, with leaves of a hoary tint, having the ribs for a few inches from the centre of dark-green colour. The firm showed the so-called "Pillar"

Begonias, Princess, and Prince of Wales, small-leaved varieties of slightly differing tints, the shape of the leaf being identical; B. Adrien Schmit, a leaf of moderate size, furnished with white spots of irregular size on light-green ground; B. Souvenir de Jean Bart, hoary or silvery in the middle area, the edge of green colour, with numerous round white spots upon it; this variety received an Award of Merit. B. Claudine Schmitt, a leaf much indented at the margin, silvery, edged with dull brown, and with a central irregular blotch of plum or chocolate colour densely spotted with white.

GLOXINIAS.

These were shown in large numbers, a few distinctly fine varieties being apparent here and there, the other predominating feature being the fine quality of the individual flowers in nearly every instance.

Messrs. J. VEITCH & SONS showed a fine assortment of their strain, in which great freedom of flowering, with comparatively small leaf growth, were conspicuous, a few of the most notable were Virginalis, pure white; Nestor, an extra

profusion of flowers; the reds and crimson here were very conspicuous, the variety called Prince of Wales, a glowing scarlet, being one of the best of these. Another, a spotted variety, was also prominent by reason of its brilliance and large size.

Mr. E. CAR, gr. to W. A. GILLET, Esq., Fair Oak Lodge, Bishopstoke, showed a collection of large well-flowered plants, which had not borne the journey so well as one could have wished, otherwise they were good examples of culture.

Messrs. J. LAING & SONS showed a small group of younger plants, and of a good strain. One of these gained an Award of Merit, in the list of which awards it will be found.

ROSES.

The reputation of the meeting for exhibits of Roses was well maintained, while many of the cut-blossoms surpassed in excellence any of previous years. Near the entrance of No. 2 tent Mr. MOUNT, Canterbury, staged a dozen large boxes of cut blossoms in grand form: those of Ulrich Brunner, Catherine Mermet, Fisher Holmes, Countess de Nadallac,

of Teck, and Duchess of Albany were also bright and clean. Their new Tea Rose, Sylph, was in much better form than last year, and is a most promising Rose, with deep salmon-flesh centre, paler edges, a large, full, and well built up flower. An Award of Merit was given to a new Tea, Grand Duc de Luxembourg, which, from foliage and habit, appeared to be a Hybrid Tea. The colour is deeper and brighter than C. Testout. Zephyr, a lemon-yellow Tea; Empress of India, fawn and salmon; an Eucharistia, a soft creamy-flesh, are also promising new Teas from Waltham Cross.

Messrs. C. TURNER & SONS, Slough, had a most attractive group at the bottom of the large tent, a large number of well-grown plants being most tastefully arranged. In the centre was an arch clothed with their Crimson Rambler, and although this is suitable for any form and situation, we never saw it more happily arranged. The same variety was shown as standards on 4-foot stems, excellently flowered. Ulrich Brunner, Crimson Rambler, Maréchal Niel, Madame de Watteville, Camille Bernardin, La France, Juno, Edward Morron, and Madame V. Verdier were particularly well-

FIG. 107.—MISCELLANEOUS GROUP OF CUCUMBERS, TOMATOS, PEAS, BEANS, AND GLOXINIAS, SHOWN BY MESSRS. SUTTON AND SONS, AT THE TEMPLE SHOW.

fine scarlet; Monarch, dark crimson-scarlet. Antigone, a fine spotted variety, dwarf and profuse; and Sunbeam, a bright crimson.

Messrs. SUTTON & SONS had their Gloninias distributed amongst their large exhibit, adding to the general but detracting from the individual effect; had these been staged collectively, they would have made a fine display of colouring. These plants were particularly noteworthy by reason of the fine cultivation, robust growth, and large flowers of decided substance, with great variety of colour; the plants, too, had borne the journey from Reading very well. One of the best of named kinds was Her Majesty, a remarkably fine pure white of good form. Another feature was the well marked and clearly defined colours, the selection having evidently been proceeded with under very careful methods.

Messrs. J. CARTER & Co. had an excellent group of their strain, in which freedom of flowering, combined with a dwarf habit, were special features; the crimson here were specially good, and the range of other colours very diffuse.

A small group was contributed by Messrs. J. PEED & SONS, consisting chiefly of their strain of spotted varieties, which possess more vigour than usual in this section.

From Messrs. H. CANNELL & SONS came a large exhibit, which, as usual in their contributions, betokened high-class cultivation. The plants were of large size, and bore a great

Camille Bernardin, Mrs. J. Laing, Maréchal Niel, Captain Christy, Prince Camille de Rohan, La France, and Baroness Rothschild being particularly good and clean. Mr. MOUNT had also a number of cut blossoms with long stems and good ample foliage, the greater value of blossoms cut in this manner for decorative purposes being very apparent. There were in this exhibit some fine examples of Crimson Rambler grown in small pots.

Messrs. G. COOLING & SONS, Bath, had a grand collection of "Old Fashioned" or Garden Roses; Austrian and Persian, and the double yellow Scotch Briars, Banksian, L'Idéal, Madame Falcot, and a promising white seedling, with long buds and good habit, being the more prominent varieties. Lawrence Allen (a light H.P.) we have seen exhibited in better form, but their single crimson bedder, with its large carmine-shaded blossoms, and compact habit, is a great acquisition in Garden Roses, especially for planting in beds. The honours for best-grown and grouped Roses may be shared between Messrs. W. PAUL & SON, Waltham Cross, and Mr. C. TURNER, Slough. MESSRS. PAUL & SON had some well-grown standards and dwarfs of Clie (evidently a better variety under glass than in the open), W. A. Richardson, Niphotos, Crimson Rambler, Medea, Caroline Testout, and Duke of York, showing in a marked manner its many varied forms and colours; White Lady, Spencer, Duke

grown, foliage healthy and ample, and blooms numerous and good.

A nice collection came from Messrs. G. PAUL & SON, Cheshnut, perhaps the best being standard plants of Madame de Watteville, a large plant of William Warden, and Paul's Carmine Pillar. The last is a grand single Rose for pillars and walls.

Messrs. W. RUMSEY, Waltham Cross, also had a good lot. The Crimson Ramblers here were the brightest in the show. Catherine Mermet, The Bride, C. de Nadallac, and Anna Olivier, were among the best pot plants. Some good boxes of Niphotos, Maréchal Niel, and others made up a good collection. Messrs. G. JACKMAN & SON, Woking, staged a large group of pot Roses that contained by far the best grown dwarf Crimson Ramblers. This grand Rose was again found in good form throughout all groups of Roses, and seemed as popular as ever. The best groups were those from Messrs. W. PAUL & SON, and Mr. C. TURNER, while the finest collection of cut blossoms came from Mr. G. MOUNT.

GROUPS OF PLANTS.

Messrs. F. SAMNER & CO., St. Albans, exhibited a group of new and rare plants, which was awarded a Gold Medal. The following plants were noticed:—Three fine but dwarf specimens of Echinocactus aureus, a species remarkable for very

formidable yellow spines, and sometimes called the Hedgehog Cactus. *Arisea fimbriatum*, and the large green *Sarracenia flava* were both represented in this collection; and there was an excellent specimen of the highly ornamental Palm, *Phoenix Robelenii*, a dwarf-growing species, with narrow leaf-segments, and possessing a most graceful drooping habit, especially valuable (see fig. in *Gardeners' Chronicle*, 1880, vol. ii., p. 475, where an old plant was illustrated) (First-class Certificate). *Dracaena Sanderiana* was represented by the best clump in a pot we have yet seen; when well grown, it is a most useful decorative plant (figured in the *Gardeners' Chronicle*, 1893, vol. i., p. 445). Some good specimens of the ornamental variety of St. John's Wort, named *Hypericum Moserianum* tricolor were shown; the centre of the leaves is usually green, with bright red margins, and white variations (Award of Merit). A First-class Certificate was awarded to a lovely Fern, *Alsophila strobilifera*, one of the prettiest of a very handsome genus. The showy species of *Cyrtanthus* (*C. obliquus*) was very well shown; the flowers are orange-red, and yellow towards mouth. There was a capital plant of *Heliconia illustris* var. *rubricaulis*, and its large handsome leaves, finely veined with rose colour, were most attractive. Another First-class Certificate was awarded to *Calamus ciliaris*, a pretty Palm that has frequently been seen; it has a very neat and compact habit, especially in a young state, that makes it very suitable for decorative purposes. *Geonoma aculis* and other fine Palms were included in the group, in addition to the ornamental-leaved *Begonias* and specialties noticed under various headings.

Messrs. LINDEN, Brussels, contributed a group of choice plants, among which the following were noticed:—*Davallia Truffautiana*, a low-habited, very delicate-looking Fern, with handsome light green foliage; the leaves, produced close to the soil, were about 3 feet long, the pinnae being minutely divided (First-class Certificate). Also some *Berteroias* (*Berterola* × *Sonerila*), the best of these being *Madame Freyran*, Mille. *Lucien Linden*, dark green leaves with silver spotting; *Madame Jean Linden*, minutely spotted with silver on an olive-green ground; and *Madame de Toiet*, dark bronzy-green with silvery spots. *Adiantum lineatum* (Award of Merit), a dwarf-habited Fern, with large cuneate lobes to the fronds, green, striped with white. *Pholidendron Devansyanum* (First-class Certificate), a plant with handsome green leaves, about 15 inches across, the stem of the youngest being blood-red, and the general habit of the plant being almost like an *Anthurium* or *Alocasia*. *Acanthophoenix grandis*, a noble Palm of very graceful appearance, was awarded a First-class Certificate.

Messrs. SUTTON & SONS, Reading, appropriated the whole of the centre table in tent No. 2 for the display of a very large and equally miscellaneous exhibit, which was awarded a Gold Medal. The vegetables, and most of the other specialties in this collection are noticed under their respective headings. A number of *Gloxinias* represented the quality of the Reading strain, and varieties in different shades of rose, purple, yellow, and white, were staged of Sutton's Spring Bedding Stocks. Double *Petunias* in pots were present. Various *Azaleas*, *Tulips*, *Lilias*, *Lilios* of the Valley, and Sutton's Prize *Colous*, were all noticed. The *Colous* is a very decorative variety, with foliage of mixed and varying colours. On an ordinary single leaf we noticed shades of red, green, yellow, and purple. *Streptocarpus Wendlandii* hybridus was represented by a group of well-flowered plants; and there were several varieties exhibited of fibrous-rooted *Begonias*, all of which are pretty, and free-flowering, differing from each other in the colour of the flowers and, in less degree, the strength of the growth.

A group of attractive appearance, and composed of a very miscellaneous selection of plants, was arranged in one of the Orchid tents by Mr. W. J. Emson, gr. to Mrs. WINGFIELD, Amphill House, Amphill, Beds. Some of the plants answerable for the greater part of the effect were *Crotonas*, *Palms*, *Dracaenas* (including *Sanderiana*), *Hydrangeas*, *Ericas*, *Caladiums*, *Hippeastrums*, and *Carnations*; a few *Orchids* in bloom afforded some additional attraction.

Messrs. CUTBUSH & SON, Nurserymen, Highgate, London, N., furnished a corner of one of the tents with a fine assortment of plants in flower and otherwise, the individual species or varieties being arranged in groups. The principal feature of the exhibit was a capital collection of varieties of *Souvenir de la Malmaison* *Carnation*, elsewhere noticed. Other features of the exhibit were groups of small plants of Indian *Azaleas* in new varieties, *Crassula rubra* and *rosa*, *Pimelea spectabilis*, several varieties of *Astilbe* (*Spiraea*), *Hydrangeas*, *Erica* *ovoidissima* and *Cavendishii*, well-grown *Mignonette*, *Saxifraga pyramidalis*, and other things, represented in fine condition.

A group of Palms and other decorative foliage plants, exhibited by Messrs. WILLS & SOAR, Onslow Crescent, South Kensington, was an excellent demonstration of tasteful arrangement upon a small area. Fine examples of *Carulodocia palmata*, *Rhapis humilis*, *Kentia Belmoreana*, *Verschoffia splendida*, and other Palms were used in the background, and small groups of such handsome plants as *Alocasia Thibautiana*, *A. intermedia*, *Anthurium crystallinum*, *Dracaena Goldieana*, *Caladiums*, *Phyllanthium Lindenii*, and dwarfier facing plants were all very effectively placed.

Mr. WILLIAM KETON, of Putney Park Lane Nurseries, S. W., furnished with specimen Palms, Bamboos, and other plants, one of the corners of a tent containing many *Orchids*. conspicuous in the group was a plant of *Kentia Posteriaria*, with yellow fronds and foliage. The varietal name of *aurea* was attached to the plant. *Asparagus Sprengeri*, *Eurya latifolia variegata*, excellent varieties of *Caladiums*, *Lilium longiflorum*, a variegated plant of *Dracaena australis*, and other *Dracaenas*. Flowering plants, such as *Crassulas*, *Saxi-*

*fragas*, *Ericas*, &c., were also used in this display with considerable effect.

In one of the Orchid tents a small group of choice plants from Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, faced the entrance. An excellent specimen of *Verschaffeltia splendida* showed well above the other plants, which included well-grown *Crotonas*, small-sized Palms, *Dracaenas*, *Dieffenbachias*, *Caladiums*, and other excellent foliage plants.

Messrs. JAE VEITCH & SONS, Royal Exotic Nurseries, King's Road, Chelsea, furnished one of the large beds upon the grass out-of-doors with a miscellaneous collection of flowering plants. The *Azalea mollis* × *sinensis* var. *Anthony Koster*, and varieties of *Azalea pontica*, *Hydrangeas*, *Lilios*, *Olearia stellulata*, and other things, were included.

#### FERNS.

The exhibits under this head showed no marked advance on previous years, but had there been a few good examples of Tree Ferns on tall stems available, a distinctly good effect could have been made in the large marquee. This idea should receive attention, if possible, on a future occasion. Messrs. BIRKENHEAD, Sale, Manchester, had the largest exhibit in point of numbers and variety, and it included several rare and seldom-exhibited species and varieties. A small case of the "Filices" was remarked, in which were *Todea Mooreana*, a plant resembling *T. pellucida*, but denser and more robust, as well as other good kinds. *Platynerium grande* and other species were to be seen here, also *Gymnogramma Alstoni*, one of the most distinct forms of the Golden Fern, the inverted pinnae showing to good advantage; *G. schizophylla gloriosa*, small plants and as such very pretty; *Adiantum speciosum*, a distinct Fern, having the appearance of great endurance; *A. palmatum*, a good example of this rather uncommon variety; *Balanium culcitatum*, not so much known as it deserves to be, were noted.

Of hardy Ferns the best were *Polystichum concavum*, a novel and distinct form, and *P. angustilobum plumosum-divisifolium tenue*, an extremely fine and distinct plant; two other good things being *Athyrium plumosum superbum* and *A. p. elegans*, both distinct acquisitions.

Messrs. J. VEITCH & SONS showed a choice group of larger plants, many of which were medium sized specimens. Here were to be seen *Todea arborea bipinnatifida*, a distinct variety of this old species with more finely-divided fronds, somewhat lighter in colour, and altogether more elegant than the type; *Platynerium Veitchii*, a distinct species of stout erect growth, each frond being of unusual leathery substance and dark green in colour, was also a prominent plant; so also were *Lomaria gibba platyptera*, a distinct variety with the pinnae much undulated; *Pteris longifolia Mariesi*, a very pretty form of this old Fern, much more elegant and of more compact habit than the type; *P. reginae cristata*, a distinct addition to small decorative Ferns of light growth; *P. serrulata gracillima*, a miniature form of the species; and *P. tricolor* not often shown; *Gymnogramma tenuifolia Veitchiana* and *G. Veitchii*, a decided addition to the light forms; *Davallia filijensis elegans*; *Nephrolepis davalloides furcans plumosa*, of dense growth; and *Dryaria morbillosa* were all well represented in this group.

Mr. H. B. MAY contributed a choice group of small plants, all of excellent culture. Amongst these were remarked *Chelidanthus elegans*; *Asplenium marginatum*, distinct with its broad pinnae; *Gymnogramma Alstoni* and *G. chrysophylla grandiceps*, both in their best character; *Onychium auratum*, very light and pretty; *Actinopteris radiata*, in fine form; *Pteris Indens*, very robust and healthy, with several other choice kinds, were also to be seen here.

Another noteworthy new Fern was apparent in *Davallia Truffautiana*, a species quite distinct and very beautiful, with large fronds of plumose character, exhibited by Messrs. LINDEN of Brussels.

*Pteris Boultonii*, shown by Mr. T. S. BOULTON, The Nursery, Tyrell Road, East Dulwich, received an Award of Merit; as a decorative variety it bids fair to be of use by reason of its hardy appearance—it comes intermediate between *P. serrulata* and *P. tremula* in character.

#### CANNAS.

These were shown in capital character by several growers, the display made proving their suitability for pot-culture, and that, too, over an extended season.

Messrs. H. LOW & CO. showed a good assortment of dwarf-grown plants, bearing a profusion of flower; the best were *Königin Charlotte*, L. E. Bailey, Paul Marquant, Edward Neig, the latter a fine crimson variety, with large flowers.

Messrs. H. CANNELL & SONS staged a fine selection of well-grown, vigorous examples, amongst which we noted *Duchess of York*, yellow and orange spots; *Aurora*, orange-scarlet; *Paul Brant*, bright scarlet; and *Königin Charlotte*, one of the most showy kinds grown.

Messrs. J. VEITCH & SONS showed a select collection of the most useful pot varieties, the plants robust and freely flowered; these were arranged with the Ferns from the same source.

Messrs. PAUL & SONS had also a few examples of the newer kinds, to one of which an Award of Merit was given, viz., to *Madame Pichon*, a bright golden-yellow with orange spots, the growth dwarf.

Mr. PERRY, gr. to C. TASKER, Esq., Middleton Hall, Brentwood, also had a group, chiefly of the older and best-known kinds, the plants extra vigorous and well-flowered; *Madame Crozy*, *Procession* and *Cheshunt Yellow*, being three of the best.

#### CLEMATIS.

Of these extremely useful spring-flowering plants under pot culture only one group of specimen plants was shown. This came from the well-known growers, Messrs. R. SMITH & CO., of Worcester, finer specimens than these, both as regards size, fine foliage and splendid quality of the flower, could not possibly be desired. The finest were—of the *C. lanuginosa* section, viz. *Gloire de St. Julien*, white and mauve; *Imperatrice Eugénie*, pure white; *Lady Carolina Nevill*, blush with mauve; *Lord Nevill*, dark plum colour; *Marie Lefebvre*, light mauve; *Purpurea elegans*, deep violet purple; *Princess of Wales*, satiny mauve, and *Sensation*, also mauve; and of the *C. florida* section, *Countess of Lovelace*, bluish lilac, and *Lucy Lemoine*, double white, were the two best, the latter a specially fine variety.

*Clematis Crimson Beauty*, a new and distinct hybrid with medium-sized flowers, crimson, flushed with purple, was shown by Messrs. JACKMAN & SON, Woking; this is a decided addition to its class, receiving an Award of Merit from the Floral Committee.

#### AZALEAS.

The greenhouse or indoor varieties did not play an important part in the display; in fact, we do not remember to have seen fewer examples shown at any previous Temple Show. A group of medium-sized plants, with compact heads of bloom, came from Messrs. B. S. WILLIAMS & SON, the best being *Roi d'Hollande*, *Madame Van der Cruyssen*, *Empress of India*, and *Vervaneana*.

Of hardy species there were more exhibits, but these were not over numerous. Messrs. J. VEITCH & SONS showed a selection of the best kinds of *A. mollis*, *A. rustica*, and *A. occidentalis*, all useful early-flowering plants. Of the *A. mollis* section, a new variety, named *M. Dubois*, a dark apricot-coloured form, received an Award of Merit. In colour it is quite distinct, and its habit is good. Of the *A. rustica* section (a most useful one for pot culture), the best were *Diamond*, blush colour with coral-red upper petals, was a singularly fine variety, the plants bearing a profusion of flowers, whilst the growth was vigorous; to this an Award of Merit was given. Another named *Aida*, rosy-blush; and one called *Ariadne*, a creamy-white, were both of great excellence. *A. Daimio*, of dwarf, india-like growth, was also shown; this should be a good companion plant to *A. obtusa*. *A. mollis* *Anthony Koster* was also shown in good style.

Of *A. rustica*, a small group of distinct varieties came from Messrs. T. CRIPPS & SONS, Tumbidge Wells. Here were to be seen again *Aida* and *Ariadne*; also *Phoebe*, a clear pale yellow; and *Virgil*, a lemon yellow variety.

#### FLORISTS' FLOWERS.

##### CALCEOLARIAS.

Some very attractive collections of *Calceolarias* were staged, and being dotted about the tents, gave attractive masses of colour at various points. Mr. J. W. JAMES, Woodside, Farnham Royal, Slough, had about two score of plants of his dwarf and compact strain, finely grown, the foliage clean and vigorous, the flowers massive, and covering the plants in bold bunches; the colours varied, and the quality excellent.

Messrs. H. CANNELL & SONS, The Nurseries, Swanley, had some two dozen excellent specimens like the foregoing, admirably grown and bloomed, the colours good, and the quality most desirable.

Messrs. JAMES CARTER & CO., Seed Merchants, Holborn, also had a collection of some eighty to one hundred plants, excellently grown, and freely flowered, the flowers a little smaller, perhaps, than in the case of either of the preceding collections, but what was lost in point of size was compensated for in the matter of quality; the looseness which is sometimes found in the largest blooms was to a great extent absent in the plants forming Messrs. CARTER & CO.'s collection.

##### CARNATIONS.

These were to be met with at various points; Messrs. W. CUTBUSH & SON, The Nurseries, Highgate, making an effective display with a quantity of plants of the old *Malmaison*, which were tastefully arranged, and they dotted about among them a few plants each of the yellow-self *Germania*, in fine character; *Uriah Pike*, in good form; *General Stewart*, shaded crimson; *J. B. Bryant*, red-edged *Picotee*, and two new varieties of decided promise, viz., *Harrow Weald Beauty*, delicate pink with flakes of rosy scarlet; and *La Villette*, sulphur ground edged with bright rosy pink. Close by Mr. C. BICK, gr. to MARTIN R. SMITH, Esq., Hayes, Kent, had a group of plants of his own raising, consisting of varieties resembling the *Malmaison* types in the size and fineness of their blossoms, including *Lady Grimston*, pale rose flushed with pink, large full flowers of fine quality (Award of Merit); *Lord Rosebery*, bright scarlet, the full flowers having finely cupped petals (Award of Merit); *Trumpeter*, deep scarlet, good form; *Mephisto*, shaded deep crimson, a very fine border variety; *Alabama*, delicate blush, a very pleasing flower; *Nell Gwynno*, white; *Sir Pritchard*, pale yellow, &c., a collection of a highly attractive character, and much admired for their superior cultivation.

Mr. CHARLES TUNNER, Royal Nursery, Slough, had at each end of his superb group of *Roses* a small collection of admirably-grown and bloomed plants, mainly of Mr. MARTIN SMITH's new varieties, such as *Cardinal Wolsey*, pale buff ground, heavily flaked on the petal edges with ruby red (Award of Merit); *Little John*, really a grand *Malmaison* type, the large and full pale rose-coloured blossom having

handsome shell-like petals (Award of Merit); The Gift, yellow ground, pencilled with orange-red on the petal edges, a very fine and attractive yellow variety (Award of Merit); Loveliness, pink, very fine in the petal (Award of Merit); Water Witch, delicate blush, very fine; Pride of Penshurst, &c. These beautiful Carnations received great attention from the ladies on account of the soft tints of most of them.

Mr. T. S. WARE, Hale Farm Nurseries, Tottenham, also had in one of his collections some boxes of cut blooms of the old Malmaison Carnations.

Mr. JAMES DOUGLAS, florist, Bookham, had bunches of cut blooms of some of Mr. Martin Smith's new varieties, such as Mephisto, dark shaded crimson (Award of Merit); Mrs. Eric Hambro, white, very fine in petal and shape (Award of Merit); Miss Audrey Campbell, pale yellow; Mrs. Seymour Bouverie, pale ground, flaked with salmon-red; Braw Lass, bright pale rose; Winnifred, deep salmon;

byblemens, Mauve Queen, flamed, and Friar Tuck, feathered; Talisman and Lord Denman, flamed. Of roses, Sarah Headly, Kate Connor, Heroine, Mabel, and Annie McGregor, all flamed. In addition there were large bunches of Darwin and other types. Quite a large collection was staged by Messrs. JAMES VETTER & SONS, which comprised in the main self varieties, some being very fine and richly coloured, such as Clarinda, bright crimson; Crepin, crimson; Buccophalus, deep crimson; La Grande, blush and cerise; Bouton d'Or, yellow; Velvet Gem, a very fine dark; General Kohler, Muriel, cerise with a broad border of white, and a black base, &c.; some fine examples of the double yellow Rose and striking Parrot varieties were included. Then Messrs. ANTHONY ROOZEN & SONS, Overveen, Haarlem, Holland, staged a number of breeders and broken varieties, among them some remarkable for their dark colours, viz.:—Faust, Negress, Cesar Borgia, Peter Barr, Louis XVI., Paul Boudry,

King Cesar, bright crimson. Of single varieties, Golconda, deep bright crimson, of fine shape (Award of Merit); Triumphant, bright cerise-rose; Ruth, blush; Mand, pink, &c. In addition, there was a box of blooms of hybrids of *Aquilegia conculca*, and boxes of cut blooms of tree *Faenones* so badly named that it was very difficult to find them; a few of the best were Louisa Mouchelet, Athlete, Triomphe de Vandermeulen, Dejanire, Mr. Chaplin, maroon-crimson; Aphrodite, white; Triumph, magenta-crimson; and Feversham, white. There were also bunches of spikes of *Lupinus polyphyllus* varieties, and also of *L. Foxi*; a deep-coloured form of the old red *Valerian* was sent under the name of *Centranthus sanguineus*; spikes of *Delphiniums*, not fully in bloom; *Oriental Poppies* in variety, *Iris* in variety; one of the most distinct forms of *I. germanica* was *australis*, deep bronzy-purple.

Messrs. Doune & Co., seedsman, &c., Orpington, Kent,

FIG. 108.—GROUP OF JAPANESE MAPLES.

Duchess of Orleans, pale yellow; and Mr. Weguelin's *Garville Gem*, of a shade of heliotrope, but not shown in its best character.

#### CUT FLOWERS.

Tulips took a foremost place, and in addition to collections of blooms, nearly every bank of cut flowers contained some Tulips, and handsome bunches of them, with those of *Anemones*, *Ixias*, *Narcissus*, &c., flanked Messrs. SUTTON & SONS' splendid central table of Peas, &c. Mr. T. S. WARE had large and striking bunches of Darwin breeder Tulips.

Messrs. BARR & SON, King Street, Covent Garden, had a large collection of English florists' Tulips showy breeders (selfs) being particularly prominent, among them the following bizarres: Catherine, William Lee, Samuel Barlow (figured in our last issue), Sulphur, Dr. Hardy, and Sir J. Paxton; Talisman, Miss Foster, Philip 1st, and Martin's No. 117; byblemens, Annie McGregor, Mabel Kate and Connor; roses of rectified flowers, there were flamed bizarres, Colbert, Sir J. Paxton, Samuel Barlow, Dr. Hardy, and Ajax; of feathered flowers, George Hayward, Sulphur, and Lord Lilford; of

and Schubert, with some of lighter shades, such as George Maw, cerise rose, feathered with pink and white; Bouton d'Or, the finest yellow self; Rev. H. H. D'Ombraun, bright crimson; Jaune d'Oeuf, bronzy gold; Hitchcock, bright rosy crimson; Petrus Hondrus, bright rose; Gondrunk, bronze and orange; Albion, white; Yukand, rosy pink; and many rectified, feathered, and flamed, in very showy bunches, in all about 100.

Anemones were represented by one small collection from Messrs. BARR & SON, double and single varieties of no great merit; but they more or less formed a part of several collections of cut flowers.

Messrs. KELWAY & SONS, nurserymen, Langport, set up one of those representative collections usual with them at this exhibition. They had boxes of cut blooms of *Amaryllis*, Mr. Chaplin, orange-crimson being one of the best; also *Pyrethrums*, both double and single. Of the former a number of blooms each of *Toison d'Or*, primrose; *Duchess of York*, deep pink; *Purpureum*, pale purple; *Ernest*, bright crimson; *Perle*, bright deep pink; *Carl Vogt*, white; and

and *Rothsay*, had a collection of bunches of *Cactus* and *Decorative Dahlias*—an unusual sight at this exhibition, such varieties as *Bertha Mawley*, *Matchless*, *Delicata*, *Professor Baldwin*, *Mrs. Peart*, *Robert Cannell*, &c.; and also of the single *Cactus* varieties they have introduced, which attracted much attention, prominent being *Lady Clare*, scarlet and magenta; *Marmion*, crimson scarlet; *Guy Mannerling*, creamy white and sulphur; *Earl of Ravenswood*, old gold colour; *Pirate*, dark crimson and purple; *Sir Walter*, rosy pink; *Alice Lee*, soft pink and white; and *Highland Mary*, cardinal red. Those who are not attracted by the formal character of the *Cactus*, *Pompon*, and single types, will find these of great use in their floral decorations. In addition there were a large number of sprays of *Violas*, chief among them being *Mary Gilbert*, *Sylvia*, *William Niel*, one of the most distinct and pretty; *Border Witch*, very delicate; *True Blue*, *Marchioness*, *Humish*, *Mr. C. F. Gordon*, *Cherry Park*, *Blue Gown*, *Florizel*, *Crimson King*, *J. B. Riding*, *Craigie*, *Minnie*, and *Christiana*, those constituting a very good selection. In addition, there were a number of bold

sprays of bright-coloured fancy Pansies which were very attractive.

A considerable collection of cut flowers was staged by Messrs. W. CORBISH & SON, of the Highgate Nurseries, who had *Heuchera sanguinea*, various Parrot Tulips, *Ixia* in variety, *Calla palustris*, *Cytisus Scoparius*, *Andreas*, oriental Poppies, varieties of *Peonia officinalis*, *Pyrethrum* in variety, bunches of the double *Narcissus poeticus*, *Carnation Mrs Leopold de Rothschild*, *Papaver umbrosum*, *Lupinus polyphyllus* in variety, the yellow Welsh Poppy, *Iris* in variety, *Cheiranthus Marshallii*, Tulips, &c.

Messrs. BARR & SON had a collection in which *Iris* played a leading part, mainly of the Germanica type, prominent being *The Khedive*, pale purple, very fine; *Florentina*, Germanica major, Asiatica, pale purple, very fine; *Prince of Wales*, white; *Purple King*, *Hannibal*, violet-blue; *Bacchus*, yellow and bronze, &c.; also bunches of *Columbines*, herbaceous *Peonies*, *Pyrethrum*, *Ixia*, *Doronicum*, *Lupinus*, the scarlet *Geum*, *Lilium*, &c.

Mr. M. PRICHARD, nurseryman, Christchurch, Hants, had a collection mainly of cut flowers, such as *Iris*, *Peonies*, *Achillea mongolica*, *Trollius caucasicus* var. *Orange Globe*, in very fine bunches (*Award of Merit*); *Anthericum Lillastrum* major; *Rubus nutkanus*, *Campanula glomerata dahurica*, some fine spikes of *Erenurus robustus*, *Peonies*, &c.

Messrs. YOUNG & DOBSON, florists, Stevenage, had bunches of Pansies, of somewhat poor character. Mr. ARTHUR RHODES, nurseryman, Guisely, near Leeds, bunches of *Myosotis*, *Princess Victoria*, which is scarcely an improvement on the type.

Messrs. WALLACE & CO., Colchester, had *Calochortis* in variety, chief among them being *C. Benthami*, yellow, and *ceruleum roseum*; also *Brodiea Howellii*, white, with faint lines of purple, and *B. capitata*; *Dodecatheon Jeffryanum*, *Fritillaria recurva*, &c., a small but interesting collection.

Mr. B. LADHAMS, nurseryman, Shirley, Southampton, had cut examples of *Pyrethrum Carl Vogt*, double white, very good; *Vanic*, blush and apricot; *Delicata*, single pink; *Melton*, double crimson, one of the best, the feathered *Hyacinth*, *Doronicum*, *Harpur Creve*, *Aquilegia*, *Pinks*, *Anemones*, *Erigeron aurantiaca*, &c.

From Messrs. CREAL & SON, nurserymen, Crawley, came a large collection, which included trusses of *Rhododendrons* and bunches of various flowering shrubs; also of hardy perennials, such as the scarlet *Geums*, *Doronicum*, *Lupinus*, *Poppies*, with bold bunches of *Iris*, &c., at the back, and also a collection of nicely arranged sprays of *Violas*, the leading varieties being *Duchess of Sunderland*, *Aurora*, *Josephine*, *Lord Elcho*, *J. B. Riding*, *Dawn of Day*, *Sylvia*, *Jena*, one of most distinct; *Ada Adair*, *Roh Roy*, *Countess of Kintore*, *Arlet*, *Royalty*, and *Icarus*.

Messrs. JAMES CARTER & CO. also had a number of bunches of showy Tulips, *Ixia*, the double *White Narcissus*, *Iris*, *Lilies*, *Anemones*, *Primula Sieboldii*, *Violas*, *Camassia esculenta*, &c.

Messrs. GEO. JACKMAN & SON, nurserymen, Woking, also had a limited collection consisting of bunches of *Papaver orientale*, *Lupinus polyphyllus*, *Aquilegia*, *Pyrethrum*, *Iris*, *Thermopsis montana*, *Peonies* of the herbaceous type, and bunches of *Carnations*.

#### PELARGONIUMS CUT.

Messrs. H. CANNELL & SON staged from forty to fifty bunches, tastefully set up with Ferns. Among them were *Fanny Edin*, Mr. H. M. Stanley, Duke of Fife, *Princess May*, *Lady Duff*, a very pleasing variety, the centre white, the bright orange-rose petals much fringed; *Duchess of Portland*, delicate pink lower petals, with slight dark top, very pleasing; *Vivid*, bright orange-scarlet; *Purple Emperor*, Mr. James Rogers, *Duchess of Teck*, white; and *Spotted Beauty*, one of the best spotted varieties.

#### HARDY HERBACEOUS PLANTS.

The finest collection of plants—and it was one of exceeding variety and attractiveness—came from Mr. T. S. WARR, Hale Farm Nurseries, Tottenham, and constituted a striking object at one end of a long tent. Here were tree and herbaceous *Peonies* in smallish pots, admirably flowered; *Iris*s, German and Spanish, in attractive variety. The beautiful *florentina*, *elsiana*, and many others unnamed, formed very pleasing features. *Spiraea astilboides*, multiflora, and compacta were capitally presented. *Aquilegia* in a big basket formed a telling and very varied clump. *Geums nigratum*, aureum, and *coccineum flore pleno*; *Saxifraga pyramidalis* in good clumps, *Lilium longiflorum* and *Thunbergianum*, *Trollius europaeus*, *Ranunculus acronitifolius* plenus in quantity, various perennial *Lupines*, *Dodecatheons*, *Thrits*, prostrate *Phloxes*, *Orobis aurantiacus*, *Erigeron alpinus*, *E. rupicola*, and diverse species and varieties enabled visitors to see how very attractive hardy herbaceous plants in pots or pans may be made.

In their collection of cut flowers, Messrs. W. CORBISH & SON, Nurseries, Highgate Hill, showed a plant of *Arctotis aureola* in bloom—a fine single bright yellow flower, recently Certificated.

Messrs. BARR & SON, of King Street, Covent Garden, and Long Ditton, showed amidst their remarkable variety of cut flowers, pieces of some alpinas, such as the pretty *Arenaria montana*, *Ruonia fl. pyrenica*, various perennial *Cheiranthuses*, *Saxifragas*, *Cypripedum calceolus*, &c.

Messrs. WALLACE & CO., Colchester, had a fine group of *Lilium longiflorum giganteum*, the trumpets long and pure white; also elsewhere a charming collection in pots of *Calochortis*, amongst which *Benthami*, *Macleana*, *rosens*, and *ceruleum* major, were very beautiful. Also very striking was

*Fritillaria recurva*, rich red flowers, and of medium height; also *Camassias*, *Brodies*, &c.

Messrs. BACKHOUSE & SON, York, had one of their customary groups of hardy plants, chiefly alpinas, grown in boxes, like imitation rockwork, and so exhibited, showing special adaptability for rock-planting. Thus planted out were various *Iris*s, *Dodecatheons*, *Heucheras*, dwarf *Aquilegia*, pretty *Primulas*, such as *Sieboldii floribunda*, &c. Various alpine *Pinks*, the charming blue *Gentiana verna*, various dwarf *Saxifragas*, *Morisia hypogea*, *Lithospermum prostratum* and *hirtum*, the latter yellow-flowered; *Daphne Cneorum*, creeping *Phloxes*, and other little things, all serving to make this group exceedingly interesting and attractive. This firm also had a large box filled with a rare double form of the orange and yellow-coloured Welsh Poppy, *Meconopsis cambrica*.

Messrs. PAUL & SONS, Cheshunt, had erected, at considerable pains, an imitation rockery in one of the tents, though perhaps rather formal, as the structure consisted of a series of steps, it served admirably to display the general habits of the various plants utilised, and made a pretty feature. Here were planted out *Primulas japonica* and *floribunda*, *Anemone sylvestris*, dwarf *Phloxes*, *Saxifragas*, *Aster alpinus*, dwarf *Geums*, *Thrits*, *Iberis gibraltaria* and *juvunda*, small *Aquilegia*, *Lychnis Lagasce*, *Achillea rupestris*, and numerous other plants suitable for the purpose.

Messrs. J. CREAL & SONS showed, as fitted up for an alcove or window, a pretty piece of imitation rock-work, in which were numerous hardy plants, including *Iberis corifolia*, *Aquilegiaerulea*, creeping *Phloxes*, *Saxifragas*, &c.

Mr. W. DENSMAN, Catherine Street, W.C., had a capital group of *Spiraea astilboides floribunda*, that showed both good culture and snow-white inflorescence.

Outside, Messrs. CANNELL & SONS, Swanley, Kent, had furnished a bed with their fine pure white-flowered Daisy, *The Bride*, that made an attractive mass of snowy flowers.

#### MISCELLANEOUS EXHIBITS.

From the CAMBRIDGE BOTANICAL GARDEN came flowers of *Iris Sari*, a very beautiful species; and *I. Korolkowii*, with sharply-pointed perianth, segments of a light-grey colour, traversed with dark-purple lines. *Hippeastrum pratense* is a rarely-seen hardy bulbous plant, with orange-crimson flowers. *Crimum variable* is another rarely-seen species, which is hardy at Cambridge. The flowers are small for a *Crimum*, white-fleshed, with rose, and borne in umbels. A boxful of the curious and beautiful *Lathraea clandestina*, and a plant of *Matthiasa altatoria*, with various species of *Cineraria*, formed an interesting little exhibit sandwiched in between Orchids, so that they may easily have been overlooked.

Some large, well-flowered plants of *Streptosolen Jamesoni* were exhibited by J. S. BENNETT-POLE, Esq., Holmwood, Cheshunt; these plants had been struck from cuttings in April, 1895; they were quite 4 feet high, and almost as much through.

Messrs. JAS. VEITCH & SONS have of late made frequent exhibits of *Phyllocactus* and *Cereus* varieties, and have obtained awards of merit for many of them. On the present occasion the firm made a very handsome and showy group of the plants on one of the tables in No. 3 tent. Some of these hybrids raised by Messrs. VEITCH possess exceedingly fine and uncommon colours. The varieties selected for distinction at this show were *Eva*, a large open flower of crimson shaded with purple; *Ovis*, a pretty, bright, warm, flesh-coloured flower; and *Elatior*, pure rose crimson; and *Emersion*, to each of which an Award of Merit was recommended.

Messrs. BALCHIN & SONS, Hassocks Nurseries, Sussex, again made a show of their specialties in the particular spot the exhibit has occupied for several years. *Boronia serrulata*, *B. heterophylla*, *Phonocoma prolifera*, *Erica verticillata*, *E. perspicua*, *E. candidissima*, *E. Spencei*, and particularly the unique-coloured *Lechenaultia biloba*. All of these plants, as shown by Messrs. BALCHIN, represented the most perfect culture that has yet been attained.

A first class Certificate was awarded the purple-flowered *Buddleia Colvillei* sprays of which were exhibited by W. E. GUMBLETON, Esq. Belgrove, Queenstown, Ireland (see fig. in *Gardeners' Chronicle*, Aug. 13, 1892, p. 187.) The Dwarf-habited Sweet Pea *Cupid*, figured in *Gardeners' Chronicle*, 1895, vol. 1, p. 793, was shown by Messrs. DORRIS & CO., who had upwards of two dozen plants in pots. The lovely and distinct *Saintpaulia ionantha* was capitally shown by Messrs. CARTER & CO., High Holborn, who had a small group of the plants in flower. The same firm showed large decorative *Mimulus*, also plants of a good strain of double-flowering *Petunias*, and the precocious *Rose*, figured in *Gardeners' Chronicle*, 1895, 1st vol., pp. 682 and 683. The seeds in this case were sown on February 9 last, and the first flower opened on May 9.

In addition to the exhibits of Messrs. J. VEITCH & SONS, which have been noticed under several headings, mention may be made of a small group of *Calla Elliottiana*, in bloom, some very well grown *Bertolonias*, sprays of the white variety of *Wistaria sinensis*, a yellow variety of *Lantana Drap d'Or*, and a number of plants of a miscellaneous character, which were interspersed amid the more important exhibits.

Messrs. JNO. LAING & SONS, Forest Hill Nurseries, London, showed several pretty foliage plants including the purple and narrow leaved *Draecena lentiginosa*, some choice *Bertolonias*, and adjoining these a pretty group of *Gloxinias*.

A small group of *Peonies* came from Mr. T. S. WARR, amongst which we noted *Rosa Mundi*, a deep salmon-pink, and *Reine Elizabeth*, a rosy-pink, as being two of the best.

A small, well-grown group of *Spiraea astilboides floribunda* was shown by Mr. W. DENSMAN of Covent Garden, the plants were in small pots, the spikes large, and the flowers pure in colour.

The only exhibitor of plants of *Pelargoniums* was Mr. H. J. JONES, of Lewisham, who had dotted about them some plants of *Cocos Weddelliana*, and a groundwork of Ferns. Altogether there were about thirty specimens, prominent among them *Radiant*, very bright crimson; *Fanny Edin*, *Alice M. Love*, delicate blush-pink; *Margery Bridgeman*, delicate pink; *May Queen*, a large showy variety; *Mrs. W. Wright*, blush-fringed petals; *Mr. Jeffery*, pale purple; *Prince of Orange*, Mr. H. J. Jones, orange-rose, very fine; and *Princess May*, soft pink.

#### STREPTOCARPUS.

From Messrs. J. VEITCH & SON came a selection of their well-known hybrids, the plants dwarf and profuse in flower; of these, the white-ground forms betokened an advance in their purity and well-defined markings.

From Messrs. SUTTON & SONS came some plants of their hybrids, in which S. Wendlandi had exercised its influence in the greater vigour both in leaf-growth and flower-spikes.

A number of these plants were exhibited by Messrs. J. LAING & SONS, who possess an excellent strain, which they have done much to improve.

RHODODENDRONS.—These were only represented by one collection from Mr. JOHN WATERER as a group, these being arranged with a selection of Japanese Maples; the best kinds were *Duchess of Connaught* and *Mr. John Clutton*, two excellent white vars.; *F. B. Hayes*, white with a dark blotch on the upper portion; and *Sappho*, somewhat similar, but with a darker blotch than in the preceding (these two are quite distinct in their markings). *Mrs. John Penn*, *John Waterer*, and *Pink Pearl* were also in good form.

LILIUMS.—These, in pots, consisted almost, if not entirely, of *L. longiflorum* in its varieties. From Messrs. R. WALLACE & CO., Colchester, came a finely-grown group of *Lilium longiflorum giganteum*, the plants vigorous and well grown, each one being crowned with several flowers. With these were included two plants of *Hennercallis aurantiaca* major, showing it to be a free-growing plant. Of *L. longiflorum* HARRIS, several plants appeared in other mixed groups; at this season, however, it should not be shown amongst hardy flowers.

#### Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair, and Messrs. JAS. O'BRIEN (Hon. Sec.), R. Brooman-White, W. H. Protheroe, David Tod, W. H. White, T. W. Bond, H. Williams, S. Courtauld, E. Ashworth, de B. Crawshaw, Ed. Handley, E. Low, F. Mason, Chas. Winn, C. Pilcher, E. Hill, F. Sander, H. J. Chapman, T. Statter, Fred. Hardy and J. Jaques.

#### ORCHIDS.

The show of Orchids was evidently affected by the absence of one of the two great champions of former years, although the other, Sir TREVOUR LAWRENCE, Bart., the President of the Royal Horticultural Society made great efforts that the display should be affected as little as possible by the regrettable absence of the Baron's stand. On this occasion Sir TREVOUR LAWRENCE'S group surpassed any of his former efforts in the extent, beauty, and variety of the plants, and especially in the large number of small botanical gems; and in the arrangement of the whole group too great praise cannot be bestowed on his Orchid grower, Mr. W. D. White, who while studying the general effect, still managed to give the small botanical plants prominent places. The group, with about 30 ft. frontage, occupied a good part of one side of the large tent, and immediately on entering, the eye was attracted by the large and showy specimens which formed the background. Among them were noble specimens of *Cymbidium Lowianum*; elegant nodding trusses of the dark red *Epidendrum* x *O'Brienianum*, and other of the red-like *Epidendrum*; arching sprays of bright yellow *Oncidium Marshallianum*, and other showy Orchids of tall growth. Beneath these in the middle space were a few fine *Laelia purpurata*, *Cattleya Mossii* and *C. Mendeli*, but it was one of the distinguishing features of the group that none of these showy Orchids was allowed except in limited number, and thus the monotonous repetition of the same plants, the obvious defect of many of the other groups, was avoided. Here and there in the fine group glowed the brilliant scarlet and mauve flowers of the fine specimens of varieties of *Masdevallia coccinea*, of which that named "luteo-oculata" is much the brightest. Still nearer the front, each one admirably arranged to show to the best advantage, were fine specimens of *Maxillaria Sandersoniana*; *Epidendrum Stanfordianum*, the Gold Medal plant illustrated last year in the *Gardeners' Chronicle*, and which was nearly as well-flowered again this season; the pretty *Oncidium olivaceum Lawrenceanum*, with many branched spikes of rose and purple flowers, and which differs from others of the class called *O. cucullatum* in flowering on all the branches at one time; *Laelia Cattleya* x *Phaebé*; a few good *Miltonia vexillaria*, a fine *Phalænopsis Aphrodite*; a good pan of *Dendrobium Bensoniana*; some brilliant *Epidendrum vitellinum majus*, *Thunia Bensoniana*, *Masdevallia* x *Mundyana*, and other *Masdevallias*, *Odontoglossums*, *Tyrrypediums*, &c. The smaller rare things, many of which proved more attractive to the visitors than the showy species, were very numerous. Among the most admired were the singular little *Bulbophyllum barbigerrum*, with its mobile, feathery labellum; the pigmy *Epidendrum organense*; *Microstylis*

macrocheila, and *M. Scottii*, pretty in foliage and quaint in flower. *Eria flava*, with stout racemes of yellow flowers; *Maxillaria Houfteana*, with yellow and red brown flowers, somewhat like those of *M. tenuifolia*, but larger and more showy; the pretty dwarf *Masdevallia Wendlandii*, covered with small white flowers; *M. glaphyraantha* with single flower of claret colour; *M. coriacea*, with numerous waxlike blooms; and other pretty little *Masdevallias*; *Coleogyne odoratissima*, a tiny species, plentifully set with white flowers; *Ocotelea diaphana*, *Epidendrum atropurpureum* *Randii*, *Stenoglossis longifolia*, *Dendrobium revolutum*; *D. polyplebium*, *Oncidium luteum*, in growth and flower much like a yellow *O. ornithorhynchum*, *Anguloa Ruckeri sanguinea*, and numbers of other good and interesting things of which the fine plants of *Odontoglossum* × *excellentis*, *Cattleya* × *Parthonia*, *Miltonia* × *Bleuana nobilior*, *Anoetochilus* (*Macodes*) *petala* and *Epidendrum* × *elegantulum* may be taken as good representatives. The whole formed a marvellous group, which, viewed from all points, left nothing to be desired—the interests of the botanist, the lover of showy flowers, and also the casual observer being alike fixed. And it should be mentioned, the time of the Committee on this busy day was also considered, for nothing was entered for a certificate.

Next came a very pretty group of *Odontoglossum*, &c., staged by WELBORE S. ELLIS, Esq., Hazelbourne, Dorking (gr., Mr. Masterton), and in which many forms of the favourite Orchid were represented, and one very handsome white variety of the *Odontoglossum crispum guttatum* class, with effective light brown spots, named *O. c. Miss Victoria Ellis*, received an Award of Merit. Also in Mr. ELLIS'S group

the greater part of the intervening space covered with large purplish-crimson blotches, the lip being decorated as well as the other segments. It was awarded a First-class Certificate. MESSRS. LINDEN also showed *Cattleya Mossie Reineckiana exquisita*, a pretty variety with large white flowers and purple-mottled lip; *Odontoglossum* × *Ruckermanum aspersum*, a distinct form with profuse red spots, near to *O. egregium*, Reich f.; *O. Pescatorei* var. *guttatum*, and *Gongora portulaca rosea*.

M. BOTELBERGE, Melle, Gand, showed a fine *Odontoglossum polyxanthum*, and M. MOENS, Lede, Belgium, *Cypripedium* × *Baptisii*, with very dark upper sepal, and shining, mahogany coloured lip.

Sir FREDERICK WIGAN, Choro Lawu, East Sheen (gr., Mr. W. H. Young), was among the best and most successful exhibitors, his fine group being plentifully furnished with rare and pretty things. As was the case last year, *Cattleya Mossie*, "Lady Wigan," with its large white flowers with delicate pink-tinted lip, was among the most admired. The back of the group was composed of *Cymbidium Lowianum*, with one example of *C. L. concolor*; some grand *Cattleya Mendeli*, *C. Skinneri*, *C. Skinneri alba*, and *C. Mossie*. Of the last-named *C. M. Beatrice*, which received an Award of Merit, was a very large and richly-coloured flower. So also among the many handsome *Laelia purpurata*, *L. purpurata*, "Arthur Wigan," stood out prominent. Its large and well-formed flowers of the *L. p. Russelliana* type were uniformly tinted with bright rose, the veining of the lip being darker (Award of Merit). Other remarkable things in this group were *Oncidium varicosum giganteum*, with very large bright yellow flowers with reddish brown blotch on the lip

*Laelia-Cattleya* × *Schilleriana* varieties; *Laelia Cattleya* × *D. S. Brown*, *Cattleya* × *Philo*, *Lycaste Measuresiana*, a form of *L. pluma* but with little marking on the pale green sepals; *Habenaria rhodocheila* and *Meiracyllium genoma* (Botanical Certificate). The group was a very fine one, and one of the best trade groups ever staged at the Temple.

MESSRS. CHARLESWORTH & Co., Heston, Bradford, had an effective group of showy orchids, *Laelia purpurata*, *Oncidium Marshallianum*, the varieties of *C. Mossie*, and *C. Schroderi* being specially fine. One *Cattleya Schroderi alba* was a very fine pure white form with only a little light yellow colour on the lip; and *C. S. coerulescens* had a violet tint over the lip. Among the *Odontoglossum crispum* was one very distinct and pretty spotted form, and other noteworthy species and crosses were the pretty pink-tinted *Vanda* × *Charlesworthii*, *Cypripedium nitidissimum*, *Cirrho. petalum picturatum* and *Oncidium superbium*.

J. GURNEY FOWLER, Esq., Gledelands, South Woodford (gr., Mr. J. Davis), arranged an effective group, in which was a good plant of the true *Cypripedium bellatulum album*, and plants of *C. Lawrenceanum*, *Hyanum*, *Epidendrum Wallisii*, *Thunia Marshalliana*, *Dendrobium Dalhousianum*, *Odontoglossum polyxanthum*, *Oncidium lanceanum*, *Dendrobium Phalaenopsis*, and *Miltonia Rozzlii alba*.

Major JOCKEY, Sunningdale Park, Berks (gr., Mr. F. J. Thorne), had a very pretty group consisting principally of varieties of *Miltonia vexillaria*, for the culture of which Mr Thorne is noted, one of the best of those shown having been illustrated in the *Gardener's Chronicle*, Dec. 21, 1895. The specimen growing in 8-inch pot bore thirty-nine spikes. In the centre of the group was a plant of *Dendrobium atro*

FIG. 109.—GROUP OF FLOWERING SHRUBS, AS SHOWN BY MESSRS. J. VEITCH AND SONS, AT THE TEMPLE SHOW.

were some good *Miltonia vexillaria*, *Odontoglossum* × *Coradini*, *Coeliodora Noezliana*, &c.

The next group came from Earl PERCY, Ston House, Brentford (gr., Mr. G. Wythes), and in it the favourite showy old kinds were effectively used, the taller plants being *Vanda teres*, *Dendrobium moschatum*, *Oncidium sphaeclatum*, *Cymbidium Lowianum*, &c., and the filling-in of good *Laelia purpurata*, *Cattleya Mossie*, *Dendrobium thyrsoiflorum*, *Cypripedium barbatum*, &c., the whole arranged with Maidenhair Ferns, and edged with alternate *Adiantums* and *Caladium aryzites*.

M. JULES HYE LEYSEN, Coupure, Oheut (gr., M. Jules Coene), exhibited a few fine Orchids, two of which received Awards of Merit, viz., *Miltonia vexillaria Coenaeana*, a fine bold flower, of a bright rose-pink colour, and with crimson rays on white at the base of the lip; and *Odontoglossum* × *expansum*, a distinct and pretty variety of some affinity to *O. Wilckeanum album*, but with the neat, evenly-spotted aspect of *O. Hunewellianum*, which may have been one of the species from which it sprang. M. JULES HYE LEYSEN also showed *Odontoglossum Ruckermanum superbum*, very richly spotted; and a large but not good-shaped *Odontoglossum crispum*, as *O. c. Duchesse*, a name which is misleading if there is any virtue in such names, for the original *O. c. Duchesse*, a very fine white, realised at auction in the early days of *Odontoglossum* culture 40 gs per half plant, two gentlemen agreeing to buy and divide the plant rather than compete for it.

Messrs. LINDEN, L'Horticulture Internationale, Parc Leopold, Brussels, well maintained the honour of their establishment by exhibiting the best rich crimson purple blotched *Odontoglossum* yet seen, in *O. c. crispum angustum*, presumably a further extension of the richly coloured *O. crispum Franz Masereel* (see fig. 106, p. 649). The flowers were of good size and form, the segments margined with white, and

(Award of Merit); *Epidendrum hastatum*, with flowers of good size, the sepals and petals pale green closely lined with chocolate, and large pure white lip (Botanical Certificate); a curious little *Eria*, *Laelia Digbyana*, *Sobralia macrantha alba*, *Thunia Wiganiana*, *Cypripedium* × *Wiganiana*, &c.

The adjoining group was staged by H. S. LEON, Esq., Bletchley Park, Bletchley (gr., Mr. A. Hislop), and in it the varieties of *Cattleya Lawrenceana* were very fine and bright in colour, and representatives of most of the other species good. *Cattleya Luddemanniana* (*speciosissima*) *Ernstii*, which received a First Class Certificate, was a remarkably beautiful variety, in colour much resembling the blossom of a good *C. labiata* *Warneri*, but with the more trumpet-shaped lip of its class. It was named in honour of Dr. Ernst, of Caracas. Also in Mr. LEON'S group were a fine *Cypripedium Rothschildianum*. Some good *Cattleya Skinneri*, *C. Schilleriana*, *C. Acklandiae*, *Laelia purpurata*, *Oncidium concolor*, *Vanda suavis*, &c.

The end of the central stage, and the return for a good distance was occupied by a magnificent and interesting group arranged by Messrs. F. SANDER & Co. of St. Albans (see fig. 105, p. 647). Raised above the centre of the end section was a splendid specimen of *Coleogyne Dayana* with many spikes. The background was composed of *Dendrobium superbum giganteum*, *D. dixanthum*, and a nearly white form of *D. Parishii*, while in front were grouped some thirty plants of botanical interest, and among which were *Oncidium pulchellum*, *O. unicorn*, and other dwarf *Oncidiums*; *Stenoglossis longifolia Thrixsperma surinamense*, species of *Pelecia*, &c. In the main group were giant specimens of *Dendrobium thyrsoiflorum* and *Laelia purpurata*, and among the *Cattleyas* a select half-dozen varieties of *Cattleya Mossie*, all very distinct and of remarkable beauty, *C. Reineckiana exquisita*, being a charming thing. Other among the many good things worthy of notice were *Luddemannia Lebnmanni*,

*violaceum* with four spikes, and several fine *Anguloa Clowesii* and *A. Ruckeri*, one of the latter having a two-flowered inflorescence. Other fine things in this group was a very large-flowered *Cypripedium Curtisi*, a good *Oncidium ampliatum majus*, *Cypripedium bellatulum*, *C. Stonei*, &c.

Messrs. B. S. WILLIAMS & SON, Victoria and Paradise Nurseries, Upper Holloway, N., had an effective group with *Vandas* and other tall-growing species at back, and excellent *Cattleya Mossie*, *Laelia purpurata*, and *Odontoglossum*, &c., in front. One, *O. Wilckeanum*, was particularly fine, and the varieties of *O. crispum* were good.

In the smaller tent, Mr. JAS. CYFFER, Queen's Road Nursery, Cheltenham, arranged a group of the showy Orchids of the season with his usual good taste. In it, the varieties of *Laelia purpurata* were numerous and good, and *Epidendrum radicans*, *E. × O'Brienianum* and other graceful kinds effectively used.

Messrs. W. L. LEWIS & Co., Southgate, N., staged an extensive group, remarkable among other things for the presence of *Laelia purpurata Lewisii* (First-class Certificate), the first really decided approach to a wholly pure white *L. purpurata*, the lip as well as the other segments being white with a few faint and almost invisible lines at the base and a still fainter pink reticulation on the front lobe—a truly remarkable variety. Also in Messrs. LEWIS'S group were *Cypripedium* × *Rossianum* (*Lewii* × *insigne* *Maulei*); *C. × Eylesianum* (*Lawrenceanum* × *insigne* *Chantini*); *Cattleya Mossie Rossiana*; *Cypripedium bellatulum Southgateense*, &c.

At the other end of the tent Messrs. HUGH LOW & Co., Clapton, had a very fine group containing many rare species and varieties, and in which alone were good *Phalaenopsis*. Here were *Phalaenopsis* × *Casta* with grand flowers; *P. × leucorrhoda* *Lowie*, a most perfect, large, pink-tinted flower; *P. × Brymeriana*, and other kinds. *Cattleya Mossie Arnoldiana* *Low's* var., which received a First-class Certificate, is

one of the handsomest forms of white Mossie, with pink feather on the petals; *Odontoglossum crispum* Lowie, a grand blotched form of the best type. In Messrs. Low's group most of the plants of the season were well-showed, and especially *Laelia tenebrosa*, *Cypripedium* & *Gertrude* Hollington, *C. x Duria-Hookere*, *C. bellatulum*, &c.

MALCOLM S. COOK, Esq., Kingston Hill, had a small, but pretty group of *Cattleyas*, *Laelias*, *Miltonia* *vevillaria*, &c.

G. H. ROLLS, Esq., Arcadia, Richmond Park, Bournemouth (gr., Mr. Purslove), also had a neat group, in which *Cattleya Mossie*, *C. Schilleriana*, *Laelia majalis*, and other showy species were good.

O. W. LAW-SCHOFIELD, Esq., New-Hall-Hey, Rawtenstall (gr., Mr. Shill), sent *Cypripedium* x *Cowleyanum* "Anna Louise," a pretty variety with large white flowers tinged with rose on the face and with a few purple spots (Award of Merit).

TUOS. STATTEN, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed the fine white-lipped *Cattleya Mendell leucoglossa*; and an excellent *Cypripedium* x *Oertrude* Hollington.

His Grace the DUKE of SUTHERLAND, Trentham (gr., Mr. P. Blair), showed a well-cultivated plant of *Odontoglossum crispum* with six spikes and in grand health (Cultural Commendation).

C. S. N. INGRAM, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), showed *Cattleya Mossie* "Chas. Ingram," a grand, light-coloured flower, with massive crimped lip (Award of Merit).

MESSRS. JAS. BACKHOSE & SONS, York, had very effective arrangements of Orchids grouped in a rustic manner.

T. W. SWINBURNE, Esq., Corndon Hall, Winchcombe, again showed *Cypripedium* x *Cordeanum*, a reputed cross between *Selenipedium* x *Sedeni* and *Cypripedium Lawrenceanum*, a record which no one believes in, for the plant has much of *C. Lawrenceanum*, and nothing of *S. Sedeni*. As a matter of fact, it is identical with a form of *C. x gigas* in Mr. INGRAM's collection, obtained between *C. Lawrenceanum* and *C. x Harrisianum*. It received an Award of Merit.

#### TABLE DECORATIONS.

The floral arrangements exhibited were numerous, and on the whole decidedly good. The best were those of Messrs. PEAKINS & SONS of Coventry, which comprised bouquets, baskets, boutonnières, sprays, and a large and handsome lyre. It was composed of spathes of *Richardia* *ethiopicum*, flowers of *Lilium Harrisii*, and sprays of white *Lilac*. A rich and elegant basket was formed with *Orchids*, *Spanish Iris*, and various kinds of delicate foliage. The prettiest bouquet was of yellow *Iris* and *Onocleids*. The sprays were models of grace and elegance. Some of the bouquets were spoiled by the intermixture of coloured ribbons, a practice that should be discouraged.

Mr. CHARD of Stoke Newington was represented by a large collection of his Arcadian arches and wirework stands. They were lightly and tastefully arranged, and showed very successfully the capabilities of this class of epergne. A quantity of white *Gladioli* was used with good effect, and an arch done with Iceland *Poppies* was very pretty.

THE HORTICULTURAL COLLEGE, Swanley, had a pretty table decoration of *Forget-me-nots* and *White Narcissis*; a simple but very tasteful arrangement. Sprays, boutonnières, and bouquets were also shown by the same exhibitors.

An exhibit of handsome funeral emblems was shown by Mr. M. STEVENS, of Victoria Street, Belgravia. Besides a beautiful cross and a fine wreath brightened with *Pansies*, there was an exquisitely simple little cross of green moss with just a spray of white *Gladioli* and *Asparagus*; and a splendid oval wreath of *Lilium Harrisii* on a foundation of *Berberis*. This latter design was particularly good.

Mr. PRESOTT, of Bayswater, sent a large exhibit of various patterns of his "Rural" stands for decorative purposes. Many of these designs lend themselves well to table use, owing to their extreme lightness. One little stand was arranged with *Pinks*, *Cornflowers*, and dark *Berberis* foliage, a most effective mixture. A somewhat larger arrangement was done with *Rosebuds*, and was very good.

Three rather heavy bouquets were shown by Mr. HENRY GARNER, of Stoke Newington.

Mrs. WALTER MOLE, of Kew, exhibited some novel designs in floral fire screens. They are composed of bamboo, and with care can be effectively decorated. The flowers can easily be removed and replaced.

#### Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq., in the chair; and Messrs. Alex. Dean, W. Farr, W. H. Divers, G. Norman, Jno. A. Laing, T. H. Crisp, T. F. Rivers, O. W. Cummins, A. H. Pearson, O. Reynolds, Geo. Wythes, C. Herrin, T. Glen, William Crump, F. Q. Lane, Jas. Smith, Robt. Fife, H. W. Ward, O. T. Miles, J. W. Bennett, Jno. Wright, W. Iggulden, Geo. Woodward, T. B. Haywood, J. W. Bates, G. H. Engleheart, H. Balderson, Jos. Cheal, and G. H. Sage.

#### FRUIT.

However representative the other sections of the show may have been, the fruit exhibits were by no means numerous. Most fruits in season are solicited in the Society's schedule, but if we except the very satisfactory exhibitions of Apples and Nectarines, the display of fruit was meagre. Foreign samples of fruit appeared to be wholly unrepresented, yet this is also provided for in the schedule. It is very early for exhibitions of fruit to be made, but nevertheless there might easily have been shown more than was present.

As is usual at each succeeding "Temple Show," a glorious exhibition of Nectarine trees in fruit was made by the well-known firm of Messrs. T. RIVENS & SON, Sawbridgeworth, Herts. This year many of the trees appeared to carry an unusual crop, and the fruits (especially the more conspicuous ones) were of a very high colour. The varieties consisted of the popular early Nectarine, Early Rivers, and The Cardinal, a new early forcing Nectarine, which is said to ripen ten days earlier than Early Rivers under the same conditions. The fruit is of medium size, has melting flesh, and is of a capital flavour. A First-class Certificate was awarded.

Messrs. GEO. BUNYARD & Co., Maidstone, showed what can be done in the way of preserving Apples in their natural condition, by an exhibit of eighty-five varieties in as many dishes, all of which were good, and some particularly well-preserved. Cox's Pomona, for instance, a variety that ripens in October, was exhibited in a firm sound and remarkably fresh condition; Emperor Alexander, Belle Dubois, Rymor, Botley Pippin, Flanders Pippin, Bismarck, Betty Geeson, King of Tomki's County, Reine de Canada, Scarlet Nonpareil, Murfett's Seedling, Bramley's Seedling, Bess Pool, Seaton House, Sturmer Pippin, Hornmead's Pearmain, Tibbett's Pearmain, Washington, Wellington, Calville Rouge, Lord Derby, Lord Burghley, Striped Beefing, Foster's Seedling, Calville Malingre, Annie Elizabeth, Alfriston, Belle Poutoise, Norfolk Beefing, Newton Wonder, Lane's Prince Albert, Howell Souring, Margil, and Melon, will give some idea of the large number of varieties it is possible to keep until the summer, a season during which English consumers have usually to depend upon the supplies from abroad. Some Peach trees in pots from the cool orchard-house were also exhibited.

From Mr. GEO. MOUST, Rose Nurseries, Canterbury, was exhibited a collection of about twenty dishes of Apples, most of which were in good preservation. The varieties were Dumelow's Seedling, Lane's Prince Albert, Allen's Everlasting, Winter Queening, Lord Derby, Winter Scarlet Pearmain, Court Pendu Plat, Cox's Orange Pippin, Annie Elizabeth, Bismarck, Gooseberry, Winter Scarlet Pearmain, Hoary Morning, Northern Greening, and Cox's Pomona.

Messrs. VEITCH & SONS, Royal Exotic Nurseries, Chelsea, also exhibited a capital collection of Apples and Pears, embracing seventy varieties. Dessert varieties were shown better and more largely than culinary ones. Braddick's Nonpareil, Sturmer Pippin, Baldwin, Barnack's Beauty, Alfriston, Bismarck, Morgan's Seedling, Glona Mundi, Newtown Pippin, Easter Pippin, Scarlet Costard, Lamb Abbey Pearmain, Pine Golden Pippin, Seek-no-Further, Jon Athan, Claygate Pearmain, Betty Geeson, Baldwin, and Manchester Pippin, appeared freshest and best, but the whole collection was in good condition for this season of the year.

A collection of Strawberries and Figs was exhibited by Mrs. WINGFIELD, Amptill House, Amptill (gr., Mr. W. J. Empson). Some exceptionally well fruited plants of Royal Sovereign were shown, and dishes of fruits of this variety; Sir J. Paxton, Laxton's Noble, and Auguste Nicuse. A dish of brown Turkey Figs completed the exhibit.

A plant in fruit and a dish of fruits of Strawberry Duke of York, were exhibited by Mr. IRVING, Leigh House Gardens, Datchet; the fruits were of very fine quality.

Mr. GEO. FEATHERLY, The Vineries, Gillingham, Kent, showed a dozen or so bunches of Black Hamburg Grapes, well coloured and ripe; also two dishes of ripe Alexander Peaches, Gillingham Perfectio Tomato, and some very fine Covent Garden Favourite Cucumbers.

GRAHAM POWELL, Esq., Horticultural College, Swanley, showed five Strawberries of the varieties Royal Sovereign and Sir Joseph Paxton.

MESSRS. LAXTON BROS., Bedford, exhibited the variety of Strawberry known as Leader. Plants carrying fruits and gathered fruits also were exhibited. This is one of the newest of Messrs. LAXTON'S Strawberries (Vote of Thanks).

In addition to the excellent collection of vegetables from Earl Percy, Syon House, Breaford, gr., Mr. Wythes, a small collection of fruit came from the same garden. In this collection were included Black Hamburg and Foster's Seedling Grapes, the former of which were well finished and highly coloured; and a dish each of Lord Napier Nectarine and Amisen June Peach. A nice fruit of Syon House Melon was noticed, and also a dish of Brown Turkey Figs.

#### VEGETABLES.

These, as compared with other exhibits, seldom form prominent features at this exhibition, but all the same, beyond the very remarkable display of produce in pots made by Messrs. SUTTON & SONS, of Reading, there were three unusually good collections of gathered produce that merited high praise. The Messrs. SUTTON & SONS on this occasion, having none others to excel in the character of their productions, did at least excel themselves, so far as relates to previous exhibitions. So extensive was their collection, that a centre table 120 feet long by 6 feet wide, was filled throughout, though flowers materially assisted (see figs. 643, 651). All down the centre of the table stood in line Tender-and-True and Earliest-of-All, smooth Runner Beans, heavily fruited, and about 5 feet in height. Tomato plants in pots, in great variety, some erect as usual, others forming arches, for which the smaller-fruited varieties are admirably adapted, and very attractive they were. Also Cucumbers and Melons, in pots, on either side, all well fruited; in boxes and in pots numerous varieties of the firm's own Peas, splendidly grown and fruited—indeed, the Peas alone might be said to present a triumph of cultivation; it seemed impossible they could have been done better. The Tomatoes consisted of Golden Oem, finely fruited; Golden Nugget, Favourite, red, very

handsome; Vesuvius, intense red, fine cropper; Best-of-All, Dessert, bright red, Plum-shaped; Eclipse, Express, Sunbeam, &c.—these were all remarkably well-fruited, and admirably grown. The Melons were with the Cucumbers trained arch-fashion, and all well-fruited. The varieties consisted of Hero of Lockinge, Sutton's Scarlet, and Eureka, the fruits nearly ripe, and very handsomely netted. The Cucumbers in pots were Sutton's Magnum Bonum, and Matchless, both long, smooth fruits; whilst some very long, handsome fruits were shown on boards of Sutton's Progress, and Peerless. Of Peas it was difficult to distinguish which were earliest, where all had been grown specially to be at their best for the show, but particularly good, and in all cases heavily fruited, carrying fine green, well filled pods putting into the shade altogether a long way any other gathered pods that were shown, were May Queen, 3 feet; Excelsior, 2 feet; Sutton's Seedling, 15 inches; Favourite, 2 feet; Early Giant, 3 feet, a very fine long pod; the Sutton Foreing, 15 inches, very free; Sutton's A1, 3½ feet; and Empress of India, 2½ feet, pods remarkably fine and well filled. Never at any previous time has a similar collection of vegetables in pots been thus exhibited, and it will be very difficult to furnish a more attractive display of these products in any succeeding year. After so much was done to show their qualities, who can say henceforth that vegetables are neglected show subjects? No wonder that to such a fine exhibit a Gold Medal was awarded.

Of other Tomatoes MESSRS. FELLOWES & RYDER, Orpington, Kent, showed numerous plants in full fruit of their excellent market variety Duke of York; and Mr. FIFE, gardener, Lockinge, Wantage, showed plants of his free fruiting variety Champion. Messrs. DUNNIE & SONS had a small group of their selected Curled Parsley growing in pots. Mr. BOUSALL, Leeds, had some heads of Broccoli Universal, much like Methven's June. Mr. MONTIMER, Farnham, Surrey, put up in boxes twenty-four fruits each of Cucumbers, Sensation, the fruits being long, smooth green, and handsome, and to which an Award of Merit was made; and also of "Approved," a variety showing more of the Telegraph type. The first-named was from Fritzenwiler x Lockie's Perfection. Mr. G. FEATHERLY, The Vineries, Gillingham, Kent, had a basket of capital No Plus Ultra Dwarf French Beans, and a good sample of Covent Garden Cucumber.

#### COLLECTIONS OF VEGETABLES.

Gardeners showed three fine lots, the first of which came from Mr. W. H. Ward, gr. to the Earl of RADNOR, Longford Castle, Salisbury. This included huge Holborn Model Leeks, Champion Broccoli, White Emperor Onions, fine Asparagus, excellent Dwarf Beans, Short Horn and Holborn Forcing Carrots, Tomatos, Radishes in variety, First Crop Potatos, Early Nonsuch Turnips, Model Cucumbers, Cabbages, Lettuces, &c., all excellent. From Mr. G. Wythes, gr. to Earl Percy, Syon House, Brentford, came a much larger collection, though not otherwise more excellent than the former, but it was a remarkable one for the time of year, all the same. Here were Veitch's Model, Sutton's Late Queen, and Cattell's Eclipse Broccoli; Matchless, Ellam's, and early Offenham Cabbages; Cheltenham Black Beet; Syon House and Telegraph Cucumbers; Ashleaf, Wythes' Seedling, and early May Potatos; Dwarf French Beans, Musbrooms, Asparagus in plenty, Chelsea Gem and Gradus Peas, Golden Queen Lettuces, Excelsior Carrots, Radishes, &c. Last, but of excellent quality, came the collection set up by Mr. Empson, gr. to the Hon. Mrs. WINGFIELD, Amptill, who had superb Lyon Leeks, Sutton's Perfection, Standwell, and Late Queen Broccoli, fine heads; capital Asparagus in great abundance, Mustard and Cress in pans, Ashleaf and Victor Potatos; Cucumbers, Sutton's Progress and Improved Telegraph; Radishes in great variety and excellence; Milan Turnips, Dwarf Beans, several Cabbages, Earliest-of-All Tomatos, and other things all admirably displayed.

#### Prize List.

[The following is a list of the awards, furnished by the Society's officials.]

NOTE.—The Silver Cups are in order of merit, the other awards are not so. Duplicate Metals are not given to trade exhibitors for flowers and plants exhibited under different heads, but one award is made for the whole. Distinct awards are made for Fruit and Vegetables.

#### GOLD MEDALS.

Sir Trevor Lawrence, Bart., for Orchids; Messrs. Sander & Co., for Orchids; Messrs. Sutton & Sons, for vegetables and flowers.

#### SILVER CUPS.

Messrs. Rivers & Sons, for Nectarines; H. S. Lion, Esq., for Orchids; Sir F. Wiggin, for Orchids; Messrs. J. Veitch & Sons, for new plants, Caladiums, Gloxinias, Japanese plants, &c.; Messrs. W. Cutbush & Son, for Carnations, cut flowers, &c.; Messrs. Hugh Low & Co., for Orchids, Cannas, &c.; Messrs. Charlesworth & Co., for Orchids; Messrs. Backhouse & Sons, for Alpines and Orchids; Messrs. C. Turner, for Roses, Carnations, &c.; Messrs. W.

Paul & Sons, for Roses; The Rt. Hon. Earl Percy, for fruit and vegetables; W. S. Ellis, Esq., for Orchids; Mrs. Wingfield, for fruit and vegetables; Mr. George Mount, for Roses; Messrs. Paul & Sons, for Roses, herbaceous plants, &c.; Messrs. R. Smith & Co., for Clematis; Messrs. J. Peed & Son, for Caladiums; Messrs. W. & J. Birkenhead, for Ferns; Messrs. G. Bunyard & Co., for Apples.

#### SILVER-OLD FLORA MEDALS.

Messrs. Cypher, for Orchids; Messrs. Barr & Son, for herbaceous plants, &c.; J. G. Fowler, Esq., for Orchids; Major Joicey, for Orchids; Earl Percy, for Orchids; Martin R. Smith, for Carnations.

Prize List continued.

**SILVER-GILT FLORA MEDALS.**  
Mr. M. Prichard for herbaceous plants; Messrs. W. Balehni & Sons for Leschenaultias; Messrs. T. S. Ware & Co. for herbaceous plants and Begonias; Messrs. J. Water & Sons, for Rhododendrons; Messrs. Willis & Segar, for foliage plants; Messrs. Perkins & Co., for bouquets; Messrs. J. Kelway & Sons, for herbaceous plants; L'Horticulture Internationale, for new plants; Messrs. J. Laing & Sons, for Begonias, Gloxinias, Caladiums; Mr. H. B. May, for ferns and foliage plants; Messrs. H. Cannell & Sons, for Calceolarias, Gloxinias, &c.; Messrs. J. Carter & Co., for Calceolarias, Gloxinias, &c.; Messrs. L. S. Williams, for herbaceous plants; Mr. Box, for Begonias.

**SILVER-GILT KNIGHTIAN MEDALS.**  
Mr. G. Pe theby, for fruit; Messrs. J. Veitch & Sons, for Apples; Earl of Radnor, for vegetables; Messrs. J. Carter & Co., for vegetables.

**SILVER FLORA MEDALS.**  
Messrs. James & Son, for Calceolarias; Messrs. F. Mow & Son, for Rhododendrons and Acers; Messrs. G. Jackman, for Roses and herbaceous plants; Mr. W.

Rimsey, for Roses; Messrs. Wallace & Co., for Lilies, herbaceous plants, &c.; Messrs. Cripps & Sons, for Acers; Messrs. Dobbie & Co., for herbaceous plants; Messrs. Chad & Son, for herbaceous plants; Messrs. G. Cooling & Son, for Roses; G. H. Rolfs, Esq., for Orchids; Messrs. Lewis & Co., for Orchids; Mrs. Wingfield, for a group of plants; Mr. H. J. Jones, for Begonias and Pelargoniums; W. A. Gillett, Esq., for Gloxinias.

**SILVER BANKSIAN MEDALS.**  
Malcolm S. Cook, Esq., for Orchids; Mr. George Mount, for Apples; Mr. S. Mortimer, for Cucumbers; Messrs Fellowes & Ryder, for Tomatoes; Mr. Fyfe, for Tomatoes; Mr. M. Stevens, for table decorations; Mr. J. Frewitt, for table decorations; Horticultural College, for table decorations and Strawberries; Mr. J. R. Chard, for table decorations; Mr. B. Ladhams, for herbaceous plants and cut flowers; C. Tasker, Esq., for Cannas and Roses; Messrs. A. Roozen, for Tulips.

**SILVER-GILT BANKSIAN.**  
Mr. W. Icton, for foliage plants.

Awards of the Orchid Committee.

**FIRST-CLASS CERTIFICATES.**  
Odontoglossum crispum Augustum, from Messrs. Linden, Brussels; Cattleya Mossie Arnoldiana Low's var., from H. Low & Co., Clapton; Lelia purpurata Lewish, from Messrs. Lewis & Co., Southgate; Cattleya speciosissima Ernesti, from H. S. Leo, Esq., M.P., Bletchley Park (gr., Mr. Hislop).

**AWARDS OF MERIT.**  
Odontoglossum crispum Lowii, from H. Low & Co.; Odontoglossum expansum, from M. J. Hye -Leyson, Ghent; Miltonia vexillaria Canaan, from M. J. Hye-Leyson, Ghent; Cattleya Mossie "Beatrice," from Sir Fred. Wigan, Clare Lawn, East Sheen; Lelia purpurata "Arthur Wigan," from Sir F. Wigan; Oncidium varico-

sum giganteum, from ditto; Cypripedium Cowleyanum Aona Louisa, from L. Schofield, Esq., New Hall Hey, Rawntestall; C. X. Cornedeanii, from T. W. Swinburne, Esq., Corndean, Winchcombe; Odontoglossum crispum guttatum "Miss Victoria Ellis," from Welbore S. Ellis, Esq., Dorking; Cattleya Mossie "Charles Ingram," from C. L. N. Ingram, Esq., Godalming.

**BOTANICAL CERTIFICATES.**  
Epidendrum hastatum, from Sir F. Wigan; Meiracyllium gemma, from Messrs. Sander & Co.

**CULTURAL COMMENDATION.**  
To the Duke of Sutherland, Tenthum (gr., P. Blair), for Odontoglossum crispum with six spikes.

Floral Committee.

**FIRST-CLASS CERTIFICATES.**  
To Buddleia Colvillei, from W. E. Gumbleton, Esq., Cork; to Platycerium Veitchii, from Messrs. J. Veitch & Son, Chelsea; to Phoenix Roebelenii, from Messrs. F. Sander & Co., St. Albans; to Calamagrostis ciliaris, from Messrs. F. Sander & Co., St. Albans; to Asipholia atrovirens, from Messrs. F. Sander & Co., St. Albans; to Philodendron Devansyanum, from L'Horticulture Internationale, Brussels; to Anthurium triumphans, from Messrs. J. Laing & Sons; to Davallia Trifurcata, from L'Horticulture Internationale, Brussels.

**AWARDS OF MERIT.**  
To Clematis Crispum Beauty, from Messrs. Jackman & Son; to Pteris Boultoni, from Mr. Boulton, Amptill; to Adiantum lineatum, from L'Horticulture Internationale; to Bertonia Macne, from Messrs. Linden, from L'Horticulture Internationale; to Caladium Duchess of Kent, from Messrs. J. Feed & Sons; to Phyllocactus Ovis, P. elatior, P. Ena, P. Eurasian, from Messrs. J. Veitch & Sons; to Gloxinia Adela, from Messrs. J. Veitch & Sons; to Caladium Silver Cloud, C. Sir J. Goldsmid, C. Duchess of Connaught, from Messrs.

J. Veitch & Sons; to Begonia Souvenir de Jean Bert, B. Pride of Castlehill, from Messrs. F. Sander & Co.; to Sonerila Silver Queen, from Messrs. F. Sander & Co.; to Hypericum Moserianum tricolor, from Messrs. F. Sander & Co.; to Trollius caucasicus "Orange Globe," from Messrs. F. Sander & Co.; to Rhododendron H. M. Arderne, R. Helen Paul, from Messrs. Paul & Son, Cheshunt; to Cana Madame Pichou, from Messrs. Paul & Son, Cheshunt; to Begonia Duchess of Pite, from Messrs. J. Laing & Sons; to Gloxinia Stanstead White Gem, from Messrs. J. Laing & Son; to Iris australis, from Messrs. Kelway & Sons; to Single Pyrethrum Golconda, from Messrs. Kelway & Sons; to Carnation Mephisto, C. Mrs. Eric Habro, from Mr. J. Douglas, Bookham; to Tea Rose Grand Duc Adolphe de Luxembourg, from Messrs. W. Paul & Son; to Azalea M. Desbois, A. Diamond, from Messrs. Veitch & Son; to Souvenir de la Malmaison Carnation Lady Grimston, S. de la M. C. Lady Rosebery, from Martin R. Smith, Esq.; to Carnation Littie John, C. The Gift, C. Cardinal Welsey, from Mr. C. Turner, Slough; to Begonia Queen of the Begonias, from Mr. J. R. Box.

Fruit and Vegetable Committee.

**FIRST-CLASS CERTIFICATE.**  
To Nectarine Cardinal, from Messrs. Rivers & Son.

**AWARD OF MERIT.**  
To Cucumber Sensation, from Mr. Mortimer, Farnham.

The Royal National Tulip Society (Southern Section).

The Annual Exhibition by the members of this Society took place in connection with the Temple Show, but it was noticed that the leading flowers came from the North and a few from the Midlands, the South furnishing scarcely any. Still the exhibition was a very creditable one, and the Society does well by holding an annual exhibition in London, to keep the Tulip before the public. Certainly, there was no lack of admirers of the gaudy flower, for many visitors appeared to be much interested in them.

The feathered flowers of all classes were somewhat weak; while the flamed flowers were good; the breeders were also past their best owing to the hastening weather of the last fortnight.

There were five collections of twelve dissimilar rectified Tulips. Mr. C. W. NEEDHAM, Manchester, was placed 1st with four bizarres, viz. Albert and W. Annibal, feathered; Samuel Barlow and Sir J. Paxton flamed; byblomems, Queen and Elizabeth Pegg, feathered; Chancellor and Adonis flamed; roses—Mrs. Lec and Lizzie, feathered; Mabel and Annie McGregor, flamed. 2nd. The Rev. F. D. HORNER, Burton-in-Lonsdale, who had of bizarres—Storer Seedling and Henry Lowe, feathered; Sir J. Paxton and Samuel Barlow, flamed; byblomems, Dainty and Charm, feathered; Talisman and Carbuncle, flamed; roses, Mrs. Atkins and Charnier, feathered; St. Arnaud and Mabel, flamed. Mr. J. W. BENTLEY, Manchester, was 3rd; and two other prizes were awarded.

With six blooms, one feathered and one flamed in each class. The Rev. F. D. HORNER was 1st, having of bizarres, Sir J. Paxton, both feathered and flamed; byblomems, Seedling of Camps, feathered, and Talisman, flamed; roses, Mrs. Atkins, feathered, and Annie McGregor, flamed. Mr. J. W. BENTLEY, was 2nd, having of bizarres, William Wilson, feathered; and Samuel Barlow, flamed; byblomems, Elizabeth Pegg, feathered; and Talisman, flamed; roses, Julia Farnese, feathered, and Lady Catherine Gordon, flamed.

In Class 3, for the same number, exhibitors in the two previous classes being excluded, there was but one exhibitor, Mr. G. EDMOND, West Norwood, who took the 1st prize with bizarres, seedling, feathered, and Dr. Hardy, flamed; byblomems, Adonis, feathered, and Talisman, flamed; roses, Annie McGregor, feathered, and Mabel, flamed.

With three feathered Tulips, one of each class, and always a very interesting one, Mr. J. W. BENTLEY was 1st with bizarre Garibaldi, byblomems Mrs. Pickrell, rose, Sarah Heady. 2nd, Mr. C. W. NEEDHAM, with bizarre Sir J. Paxton, byblomems Elizabeth Pegg, and rose, Mrs. Lea. Mr. A. CHATEAU, Cambridge, was 3rd.

With three flamed Tulips, one of each class, the Rev. F. D. HORNER was 1st with biz. Sir J. Paxton, byb. Talisman, and rose, Triomphe Royale. 2nd, Mr. T. HAYNES, whose varieties were unnamed. 3rd, Mr. J. W. BENTLEY.

Class 5 was a special one for two rectified Tulips, one feathered and one flamed, the first prize being the Samuel Barlow Memorial Medal. This was won by Mr. C. W. NEEDHAM, who had biz. Sir J. Paxton, feathered; and byb. Eliz. Pegg, flamed. Mr. J. THURSTAN was 2nd, and the Rev. F. D. HORNER 3rd.

The Breeder Tulips were, as usual, very striking in their pleasing self-colours, though time had somewhat dimmed the freshness. With six blooms, two of each class, the Rev. F. D. HORNER was 1st with good blooms of biz. Sir J. Paxton and seedling; byb. seedlings, excellent in colour; roses, Lady Grosvenor and St. Arnaud. 2nd, Mr. J. W. BENTLEY with biz. Lloyds 47 and Goldfinder; byb. Leache's No. 1 and Eliz. Pegg; and roses, Queen of England and Mr. Barlow. 3rd, Mr. JAS. THURSTAN.

With three breeders, the Rev. F. D. HORNER was again 1st with biz. Sir J. Paxton; byb. seedling; rose, Lady Grosvenor. Mr. C. W. NEEDHAM was 2nd, and Mr. T. HAYNES, 3rd.

The class for collections of florists Tulips did not bring any competition, probably because they were provided for in the schedule of the Royal Horticultural Society.

The premier feathered Tulip was biz. W. Annibal, shown by Mr. C. W. NEEDHAM; the premier flamed, biz. Sir J. Paxton, from the Rev. F. D. HORNER, and the premier breeder, Lloyds 47, biz., shown by Mr. J. W. BENTLEY.

Three collections of florist's Tulips competed in the class set apart for them, the 1st prize going to Messrs. BARR & SON for a collection which formed a part of a large bank of cut flowers in another part of the tent, the particulars of which are given elsewhere. Mr. GEORGE ENO, South Norwood, took the 2nd prize with a number of bunches, and Mr. JAM. S. THURSTAN, Cannock, Staffordshire, was 3rd.

**A FATAL ACCIDENT.**—We regret to learn that Mr. S. MORTIMER's foreman met his death on Monday evening. He had been to the Temple Show on that day in connection with Mr. MORTIMER's exhibit. Mr. KNIGHT left London by a late train, and probably fell asleep, as his body was discovered on the line near Farnham Station, suggestive that he had jumped from the train as it was leaving the station.

HOME CORRESPONDENCE.

**VEGETABLES AND VEGETARIANISM.**—The short article in your journal for April 11, and the letter in a recent issue, are both worth consideration; we grow most of the succulent vegetables in this country—man sends the cooks! The distribution of green stuff and Potatoes in the metropolis has been so often noticed in these pages, is so imperfectly managed a business as to be almost a disgrace. It seems a farce to keep carting from market gardens into almost the centre of London, and then carting back again half the distance to the actual consumers. The County Council is, I am told, unable to move in the matter. Vegetarianism seems almost a misnomer where so many potential chickens, butter, milk, cream, and all sorts of spices are employed; and there are places in London where you cannot get anything in the "vegetable" line under sixpence! In these establishments the chefs know their business, and draw new dishes from Paris, Vienna, Venice, Florence, &c.; but as a rule cookery in London dining-saloons is of the most execrable description. Anybody with "cheek" enough may start as cook, or rather first as vegetable-girl, and in a short time turns out a full-fledged cook, who can cook neither fish, flesh, fowl, or hard-roe'd herring! Too often, also, the proprietor of these places does not know good ware when he sees it, and actually complains when he gets excellent vegetables that they will not cook—his cook says so! A good deal in the trumpeting line has been done as to the teaching of cooking in Board Schools—but the real proof has yet to be put in. Pretty sightly to see all the charming little maideus—hair nicely brushed and tied up out of the way, clean pinafores on, bright eyes and quick fingers at work; but not as a rule on vegetables proper—or (in season) jams, jellies, cakes—But Cabbage, "grass," Cauliflowers, Broccoli, Potatoes, Carrots, Turnips, Leeks, Artichokes, Seal-kale? I have questioned many youngsters on these, but they have not yet got to them. Perhaps better treatment, or more consideration for young cooks, and getting into touch with Board Schools might soon tell on the fare to be had at dining-saloons for most money; but here again there must be united action, I think, on the part of those who cater for lovers of humble succulent vegetables. Location of markets may be left to the London County Council, who may some day get to work on Mr. Delaroché's proposals, as printed in the last report on markets in London. E. C.

**THE SWEET PEA.**—This, in my estimation, is the finest of all annuals, not excepting the Viola, which is almost equally loved. Of the many precious Sweet Peas which have been raised by Mr. Eckford, the finest are Blanche Burpee, Mrs. Eckford, Primrose, Stanley, Dorothy Tennant, Countess of Radnor, Her Majesty, and Countess of Aberdeen. Of these, Blanche Burpee, and Mrs. Eckford are especially beautiful, the former surpassing even the famous pure white American variety, Emily Henderson, which, however, is one of the finest in existence. Tropæolum speciosum, when grown alternately in the manner I have indicated with the Eckford Sweet Peas, and especially those of delicate hues, produces a strikingly artistic effect. David R. Williamson.

**TOMATO CULTURE.**—With the month of May, preparations for outside Tomato culture should be taken in hand. If a wall facing south or south-west is available, the chance of making use of it for Tomato culture should not be lost. The plants having been raised from seeds sown some six weeks or two months ago, are now standing in a cool-house or frame in process of hardening off. In summers like that of 1895, it pays to take pains with the preparation of the soil. A trench 2 feet deep and 1 foot wide, measuring from the wall, should be dug out, and some broken bricks and mortar rubble placed in the bottom for drainage if the soil be heavy, and over this a layer of spent Chrysanthemum soil 1 foot thick should be placed, which will do very well to plant in, as not being too rich it will not cause rank growth, but the plants will develop clusters of flowers instead. I prefer early planting, so as to have a long season. If frame-lights are available, these may be used with advantage to cover the plants, leaning them against the wall; and if these are removed by day, which is not necessary at first, they should always be placed over the plant in the evening when the thermometer is likely to fall to 40°. Mats would answer if kept away from the plants by some

sort of contrivance. Plant at 2 feet apart, train the plants upwards on the wall, fastening them securely by means of ties or nails and shreds. Confine the plants to a single stem, and keep all side-shoots rubbed off, and do not mutilate the plants whilst young by cutting the leaves halfway back as some do, as a check is given by so doing. After the plants have begun to flower, they may be trimmed up with advantage, as the large leaves would keep the sun and air from passing on and around the flower. After a good set has been obtained, top-dress the ground with a fairly rich compost consisting of two parts turfy loam, one part leaf-soil, and one part half-decayed horse-droppings; and when the roots have seized upon this top-dressing, afford manure-water from the stables or cow-sheds twice a week, and occasionally sprinkle the surface with Thomson's Vine-manure, or the Chelsea artificial manure, at the rate of a teaspoonful to a plant. Syringe the plants twice daily in fine weather till they have come freely into flower, and should the white Tomato-fly be troublesome any time during the season, syringe them with soapy water or diluted tobacco-juice at the rate of one pint to one gallon of water, taking care to go over the plants with clean water after an interval of about a quarter of an hour, so that no stains are left on the fruits or foliage. Of course, we all know Tomatoes can be grown in the open supported by sticks, but walls are preferable, as they retain the heat which is so essential to the ripening of the fruits. The under-mentioned varieties are very suitable for outside culture in ordinary summers: Frogmore Selected, Hackwood Park, Large Red, and Sutton's Earliest of All. *H. Humphrey, Nutfield Priory, Surrey.*

**THE EXONIAN PEA.**—It may be interesting to your readers to know that the above culinary variety of Peas has proved very trustworthy and early, a customer of ours having picked to-day (May 16) a good quantity from rows growing in a fully-exposed position, from seed sown on January 6. *Elcombe & Son, Romsey.*

**LIGHTNING PEA.**—I enclose a sample of Messrs. Carters' Lightning Pea, the best early one I have ever grown. I sowed them the second week in January, and picked Peas on April 18, and we are still picking from them; they are growing in a cold vinery. *G. Whiffin, Ightham Court, Ightham, near Sevenoaks.*

**SHOOT-THINNING THE PEACH.**—Disbudding of the Peach, and of course, its relation, the Nectarine, in order to obtain fruiting shoots another season, must be unremitting care during the remainder of the present month and throughout June. Perseverance with this kind of work is very important, nothing working more harm to the trees than to allow an excessive number of shoots to form, and then to remove them at one operation, as is often done. Keep those shoots wanted to fill up spaces on the wall, and take the place of this season's fruiting shoots, resolutely removing all the others at short intervals of time. Quite young and partially-trained trees require somewhat different treatment to older trees, the object of the operator being the laying out the foundation of a tree in the first place, fruit being only a secondary object. In fact, much fruit production tends to hinder a desirable rapid formation of shoots. Being now towards the end of the month the thinning of shoots should go on apace, as one has no need to think of the shelter the shoots afford the fruit as against frost after this date. An important matter at this season is the destruction of aphids, and the removal of every leaf and shoot attacked by blister, burning these forthwith, or the spores of the fungus will spread to the Peach and other plants. Against aphid I generally make use of Quassia, three washings with this keeping the trees free from aphids for the whole season. *H. Markham.*

**APPLE ANNIE ELIZABETH.**—I quite agree in what "A. D." wrote recently respecting this variety of Apple. We have some bush trees here which always bear well, and last year the Apples were very fine in size, and beautiful in colour. Besides being a good bearer, it is a splendid keeping Apple, lasting till April and May. It is, I consider, one of the best Apples we have, especially suitable for this neighbourhood, and one that always fetches a good price in the market, the fruits being firm, and this and colour are important points in market fruit. Its only fault is its being a little spotty sometimes. Trees lifted the previous autumn bore good crops of fine, well-coloured fruits last year. *F. Q. C., Liffon Park Gardens, Devon.*

**PEARS v. DIPLOSI PYRIVORA.**—I forward specimens of Pears infested with Diplosis, showing that daily syringing with quassia, soft-soap, &c., right up to the time of the flowers opening were quite useless as a preventative, and showing also that heavy dressings of fresh gas-lime, strewn thickly under the trees last spring for the larvæ to fall into had not the desired effect. I begin to fear we have no real remedy for these almost invisible foes. Perhaps, in time, our entomological experts may be able to discover some means of prevention; however, it is not in my nature to await with patience such a millennium, and I must be up and doing all I can to keep down their numbers by gathering and burning all the affected small fruits of the Pear. Of course, this hand-gathering becomes an expensive business, but there is no other alternative. The fruits sent were gathered from a Beurré de l'Assomption Pear, and every fruit on this tree was affected, as many as eighteen larvæ being counted in one Pear. It appears that the earliest-opening flowers are worst affected. I should like to hear the experience of others. *W. Crump, Madresfield.* [Try Bordeaux Mixture or Paris Green, another time, but do not forget that they, especially the latter, is very poisonous. Ed.]

**THE GIANT SAW-FLY.**—Mr. William Cuthbertson has called my attention to a paragraph in your issue of 2nd inst. (p. 564), regarding the hornet or giant saw-fly—*Sirex gigas*—a specimen of which had been obtained at Dropmore. Mention is also made that the fly had probably been introduced from the north of Europe. For, at least, the last twenty-five years, numbers of these flies have been regularly seen by men employed felling trees in Bute and Arran, in connection with Mr. Halliday's sawmills here. I have several specimens of the female fly in my possession, which were caught alive during the last two or three years at the sawmill, when cutting up some Scotch Fir brought from Brodiek in Arran. There are three or four different woods in Bute, where these flies are seen by the woodmen every season. They are also got at Ormisdale on Loch Ridden in the Kyles of Bute. The wood sometimes contains so many of the larvæ of these flies, that it becomes quite "soapy or greasy" when cutting through it with the saws. It would be interesting to learn how these flies have got to this part of Britain if they are not indigenous. From the long time they have been known to the local woodmen, we can hardly believe they are "tourists." My own impression, from the information which I have obtained regarding them is, that the fly is native to and fairly common in Bute and Arran, and the surrounding districts. The fact that they are so often mistaken for the hornet, may have prevented their true nature from being recognised. *J. Ballantyne, Gasworks, Rotheray, May 12, 1896.*

**EARLY CABBAGES.**—"Mein's No. 1" is, as most gardeners know, a first-class early Cabbage, with small, compact hearts, fit for private use, but regarded as too small as a market variety. Mein's No. 1 and Ellam's Cabbages were planted side by side at I foot apart each way for removing early, and I have been cutting from Mein's since the first week in April, and Ellam's became fit for use last week; the former may, therefore, be regarded as a most useful early variety. Only a very few of our Cabbages bolted, although I hear complaints from gardeners and others about here of their having done so. Is it because seed was sown rather early, the autumn being favourable, and the winter mild? *F. Q. C., Devon.*

**FRUIT PROSPECTS IN NORTH DEVON.**—There is every appearance of a good fruit year. Most of the Apple trees are covered with bloom, and all that we want is freedom from frost. Bushes and pyramids are quite as full of bloom as the standards. Pear trees have set a fine crop, and on walls they are swelling away fast; the same may be said of Plums, which will be very plentiful, and of Cherries. Gooseberries are very abundant, and there will be plenty to remove in the green stage. *F. Q. C., Liffon Park Gardens.*

was for many years one of the chief centres for the distribution of new and rare plants, and especially of florists' flowers. In the *Gardeners' Chronicle*, April 11, 1846, we find Messrs. Garaway, Mayes & Co., announcing "that their catalogue of Dahlias, Fuchsias, Geraniums, Verbenas, Petunias, Cinerarias, &c., is now ready," and there they with justice term their place "this old-established nursery." Half a century has rolled away, since that date, and a good account did the establishment give of itself, always under the guidance of a Garaway, until bit by bit the encroachments of bricks and mortar in recent times have much reduced the once extensive grounds, and rendered the cultivation of some of the more delicate plants more difficult. Many old plant-lovers will be sorry to learn that another threatened encroachment will render it almost imperative to find a new site for the nursery. Many of the old houses are still devoted to the cultivation of florists' flowers, both for flowering in pots and likewise furnishing seeds of special strains for sale, the trade in seeds being an extensive one. The bedding, show, and decorative Pelargoniums were a specially fine lot of plants, and the Azaleas, Cytisus, *Spiræa astilboides*, Freesias, Bouvardias, Lilies, &c., each in their house, made a very good show, the plants being well grown.

The Orchids which are useful as cut flowers are being grown in still greater number, rather than curtailed; and in one of the lean-to houses we found a number of the large-flowered *Cattleyas* and *Lælias* in bloom; also some of *C. Schroderæ*, *C. Mossiæ*, *C. Mendeli*, *Lælia purpurata*, &c. Among *Cypripediums* in bloom were a number of *C. Lawrenceanum*, *C. bellatulum*, *C. Argus*, *C. Boxallii*, and varieties of *C. barbatum*. Among *Dendrobiums*, the chief floral display was found on plants of varieties of *D. nobile*, *D. Fudlayanum*, *D. Hildebrandii*, *D. infundibulum*, and *D. Jamesianum*, which last-named found a place in the *Odontoglossum* house, and the plants were doing well in the cool temperature. Of *Odontoglossums* there were varieties of *crispum*, *Pescatorei*, &c. In a large house devoted to decorative Palms were a number of vigorous plants of *Dendrobium Phalaenopsis Schroderianum*. A good batch of scarlet-spined *Anthuriums* was remarked.

MARKETS.

COVENT GARDEN, MAY 21.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOS.

JERSEY arrivals not heavy, prices firm at last week's quotation. Malta consignments have been small this week. Canary fairly heavy. State of market about same as last report. J. B. Thomas.

SEEDS.

LONDON: May 20.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, S.E., report to-day's market bare of buyers. The recent prolonged and mischievous drought has naturally stopped all sowing orders; meantime, holders of Clover and Trefoil seeds express considerable confidence as to a higher range of values in the near future. For Tares there is a better sale. Mustard and Rape-seed keep firm. New Turkish Canary-seed for September shipment is now offering at attractive rates. Hempseed is firm. As regards Peas and Haricots, holders, in view of an early shrinkage in the supply of green vegetables, ask full prices. Buckwheat keeps strong. Linseed is dull.

POTATOS.

BOROUGH: May 19.—Quotations:—New sorts ranging from 5s. 6d. to 12s. per cwt.; Old from 40s. to 8s. per ton.

SPITALFIELDS: May 19.—Quotations:—Old: Bruces, 30s. to 50s.; Main Crop, 35s. to 50s.; Graut, 35s. to 50s.; Scotch, 40s. to 50s.; Blacklands, 20s. to 30s. New: Jersey Kidneys, 10s. to 12s. per cwt.; do. Flukes, 11s. to 12s. dz.; Lishons, 4s. 6d. to 6s. (do.); Canary, 7s. to 8s. do.; Maltese, 7s. to 9s. do.; St. Malo, 9s. 6d. to 11s. do.

STRAITFORD: May 19.—Quotations:—New: Jersey Kidneys, 10s. 6d. to 11s.; do. Flukes, 11s. to 11s. 6d.; Cherbourg, 9s. to 9s. 6d.; St. Malo Flukes, 10s. to 10s. 6d.; Lishon, 6s. 6d. to 7s.; Canary, 7s. to 10s. 6d. per cwt. Old: Dark soil, Bruces, 15s. to 20s.; light do., 50s.; Reading Giants, 20s. to 50s.; Sutton's Abundance, 20s. to 40s.; do. Magnums, 20s. to 40s. per ton.

FARRINODON: May 21.—Quotations:—Old, 30s. to 60s. per ton. New: Best Flukes (Jersey), 11s. to 12s. per cwt.; Ashleaf Kidney, 10s. 6d. to 11s. 6d. do.

FRUIT AND VEGETABLES.

BOROUGH: May 19.—Quotations:—Cabbages, 2s. 6d. to 3s. 6d. per tally; Onions, 5s. to 5s. 6d. per cwt.; Spring do., 1s. 3d. to 1s. 9d. per dozen bunches; Rhubarb, 1s. 3d. to 2s. per dozen bundles; Horse-radish, 8s. to 12s. per dozen rolls; Apples, Tasmanian, 8s. to 12s. per case.

STRAITFORD: May 19.—Quotations:—Cabbages, 2s. to 5s. per tally; Greens, 1s. to 1s. 6d. per bag; do. 1s. 6d. to 2s. per dozen bunches; Cauliflowers, 1s. 6d. to 2s. per dozen; do. 7s. to 10s. per tally; Beetroot, 4d. to 6d. per dozen; Horseradish, 1s. 9d. to 2s. per bundle; Parsley, 6d. to 1s. per dozen; Rhubarb, forced, 1s. to 1s. 3d. per dozen bunches; do. field, 2s. to 2s. 6d. do.; Leeks, 1s. 3d. to 2s. do.; Spring Onions, 1s. to 1s. 6d. do.; Salad, 1s. 9d. to 2s. per dozen punnets; frame Cucumbers, 1s. 9d. to 2s. per dozen; Asparagus, 7s. to 14s. do.; Turnips, 2s. to 2s. 6d. per dozen bunches; Carrots, household, 20s. to 40s. per ton; do., cattlefeeding, 10s. to 20s. do.; Mangels, 11s. to 15s. do.; Onions, Egyptian, 90s. to 100s. do.; Apples, Tasmanian, 10s. to 11s. per box.

SPITALFIELDS: May 19.—Quotations:—Cabbage, 1s. 6d. to 2s. 6d. per tally; bunch Greens, 1s. to 1s. 6d. do.; Cauliflowers, 4s. to 5s. do.; Spinach, 9d. to 1s. per bushel; Rhubarb, 1s. 6d. to 2s. per dozen bundles; Radishes, 4s. to 5s. per tally; Lettuce, 9d. to 1s. per score; Leeks, 1s. 6d. to 2s. per dozen; Mint, 2s. per dozen bunches; Parsley, 1s. to 1s. 6d. do.; Cucumbers, 2s. to 3s. per dozen; Asparagus, 9d. to 1s. per bundle.

FARRINODON: May 21.—Quotations:—Cabbages, 4s. 6d. per tally; Cauliflowers, 8s. do.; Greens, 1s. 3d. per bushel; Spinach, 2s. do.; Leeks, 2s. per dozen; Mint, 2s. per dozen bundles; Rhubarb, 3s. do.; bag Onions, 5s.; Carrots, 9s. per dozen bunches; new Turnips, 10s. do.; Horse-radish, 1s. 9d. per bundle; Asparagus English, 1s. 4d. do.; do., French, 1s. to 1s. 3d. do.; Tomatos, English, 11s. per dozen lb.; do., foreign, 1s. 6d. per tray; Cucumbers, 3s. 6d. per dozen; Lettuces, flat, 6d. per dozen; Peas, 4s. per flat; Gooseberries, 6s. per half-sieve; Apples, Tasmanian, 12s. to 14s. per case.

HAY.

Averages.—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, prime, 55s. to 87s.; inferior, 35s. to 60s.; Hay, best, 60s. to 85s.; inferior, 30s. to 55s.; mixture, 60s. to 84s.; and straw, 20s. to 49s. per load.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.) for the week ending May 16, and for the corresponding period last year:—1896: Wheat, 22s. 7d.; Barley, 21s.; Oats, 14s. 5d. 1895: Wheat, 22s. 10d.; Barley, 23s. 6d.; and Oats, 15s. 3d.

(The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fabr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

The districts indicated by number in the first column are the following:—0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; \*Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending May 16, is furnished from the Meteorological Office:—

"The weather was again fine and dry generally, but thunder and lightning, accompanied by slight rain, were experienced over the eastern and northern parts of the kingdom on Tuesday, and a little rain fell at many of our northern stations later in the week.

"The temperature was much above the mean, the excess ranging from 3° in 'England, E.,' and 4° in 'England, N.E.,' to 7° in 'Ireland, N.,' and to 8° in 'England, S.W.,' The

highest of the maxima were registered, as a rule, on the 12th, when they varied from 85° in 'England, S.W.,' 81° in the 'Midland Counties,' and 80° in 'England, N.E.' and 'Scotland, E.,' to 75° in 'England, N.W.,' and to 72° in the 'Channel Islands.' The lowest of the minima were recorded either on the 10th or 11th, and ranged from 34° in 'England, E.,' to 42° in 'England, S.,' and 44° in the 'Channel Islands.'

"The rainfall was reported from our more northern and north-eastern districts only, where some very slight amounts were measured on two or three occasions.

"The bright sunshine was very prevalent in all districts, the percentage of the possible duration ranging from 53 in 'Scotland, N.' and 'England, N.E.,' to 66 in 'England, S.,' 71 in 'England, S.W.,' to 78 in the 'Channel Islands.'"

MANCHESTER HORTICULTURAL AND BOTANICAL SOCIETY (Telegram).

—The annual Whitsuntide Exhibition by the Manchester Royal Botanic Society in the gardens at Old Trafford was opened on Thursday by the Earl of Derby in magnificent weather. Orchids were the chief plants shown. E. Ashworth, Esq., Harefield Hall, Wilmslow, took the principal prize, and was followed by F. Hardy, Esq., Tyntesfield, Sale. T. Statter, Esq., Standhall, White field, Manchester, had the best collection of Cattleyas. Amongst nurserymen Mr. J. Cypher, Cheltenham, took the 1st prize for Orchids, Messrs. Robson & Heath following. Messrs. F. Sander & Co., St. Albans, staged a grand lot, and they took in all a large gold medal and sixteen 1st class certificates; Messrs. Charlesworth & Co., Heaton, followed. Messrs. Sutton & Sons, Reading, and B. S. Williams, Holloway, showed well in miscellaneous groups; and Mr. C. Turner, Royal Nurseries, Slough, had a very fine display of Roses, Pelargonium, &c.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

A CORRESPONDENT asks for information as to the names and addresses of local horticultural societies in India and Australia, and of horticultural papers existing in those parts of the empire?

Can any of our readers kindly inform *Scrutator* whether they have ever known the Double White Narcissus when grown in bulk out-of-doors develop single flowers in lieu of double?

A PLAGUE OF MICE: W. E. G. Having failed to lessen the evil by the use of traps and poison, would it not be advisable to employ our ancient friend the domestic cat, who if it be unable to devour "the army of mice," may be capable of scaring the rodents out of the houses. Neither we ourselves nor any of our readers can have any notion of the way in which they have got into your houses.

ARTIFICIAL MANURES FOR CHRYSANTHEMUMS: A. R.

For suitable soils and the inorganic constituents of the plant, see the issue of *Gard. Chron.* for May 2 this year. The Chrysanthemum requires a good deal of manure applied in the liquid form soon after the roots have permeated the soil of the pot in which it is to bloom. Various substances are employed—farmyard drainings, diluted with water if strong, sheep and deer dung, say half-a-bushel put into a sack and soaked for twenty-four hours in forty gallons of water. Soot may be employed in the same manner; nitrate of soda at the rate of half-a-teaspoonful to a 10-inch pot applied dry and watered in; sulphate of ammonia in smaller doses, dissolved in water first, to well-rooted plants, none other. Only a very few applications of this manure are needed or safe. In affording manure to these and other plants, it should, for the first few weeks, be afforded in feeble doses; gradually increasing the strength of them, but at no time using it of great strength. The gardener must be guided by the appearance of the plant, which should have foliage of a healthy green colour, leathery in texture, with stout, short-jointed stems. The plethora that is productive of fasciation in the shoots, and excessively gross leaves of a bluish-green tint, are better avoided.

**BOOKS:** *Hoozeven. ON THE ROSE: The Book of the Rose*, by Mr. W. PAUL, Waltham Cross, Hertfordshire. **TOMATOS:** *The Tomato: its Culture and Uses*, by Mr. Iggulden; published at the Office of *Journal of Horticulture*, 171, Fleet Street, E.C. **MANURES:** *Artificial Manures*, by M. Georges Ville; translated into English by W. Crookes; published by Longmans, Green & Co., London. The last-named publishers, or Blackwood & Sons, Bedford Street, Covent Garden, W.C.; Blackie & Sons, Glasgow and London, would furnish you with a list of horticultural works.

**CARNATIONS IN AN UNHEALTHY STATE:** *G. C.* The Carnations are not affected by any fungus disease. There are plenty of the spores of *Macrosporium* upon the dead leaves, but this occurs only upon dead tissue. We find no symptoms of bacteriosis, or of *Heterosporium*, and yet the plants are not in a healthy condition. It looks like a functional weakness, confined to one consignment of plants. *M. C. C.*

**COLOURING PAMPAS-GRASS PLUMES:** *Pampas.* Supposing that the plumes have been bleached in a sulphur-chest, or in the sun, they will be fit for taking any desired colour. The dyes used are now wholly those known under the name aniline, or colours allied to these, and almost all are soluble in water. The mixed colours should be preserved in stoneware wide-necked jars or tin bottles, ready for use, and the corks with which they are stopped should be furnished with a piece of lead-pipe of the thickness of a lead-pencil, which is of use in carrying off the steam produced on dissolving the dye. Having put water (distilled is best) into a bottle, hang it in a vessel of hot water, and bring the contents almost to the boiling-point; now put in the dye-stuff, and shake the contents vigorously. Only tinned, or enamelled, or earthen vessels, should be used to lay the goods to be dyed in. As a rule, grasses take dyes less readily than flowers; and it is advisable to lay them in a pickle of soap 85 gr., soda 210 gr., and 10 litres of water, for one to two hours, stirring them about in it, and washing them several times in warm water, and then applying the dye. For cardinal-red, bring 10 quarts of water to nearly boiling-point, and then put as much dissolved colouring out of the jar or bottle as will bring the water to the right tint; place the grasses therein, and bring the mixture almost to the boiling-point—no alum is required. Ruby-red is similarly managed, and a blue shade can be given by the addition of methylviolet, and a yellow one by using chrysoline; and many other tints can be got by using these two colouring agents. Scarlet (dark), water and cooking as before, but 150 gr. alum must be added to the mixture; a lighter shade may be obtained by using aniline orange or naphthaline-yellow. The proceedings in general are much the same as those we have given, but we would advise you to obtain a little work in the German language, entitled *Das Trocknen und Färben Natürlicher Blumen und Gräser*, by Heinrich Hein, Weimar, Bernhard F. Voigt (Aug. Siegle, 30, Lime Street, E.C.).

**CUCUMBERS:** *G. S.* Your Cucumber plants are in a very bad condition, and in so far as our experience goes, are suffering from a new form of disease, which differs in its manifestations from the bacteriosis of Cucumbers and Gourds in the United States (*Botanical Gazette*, November, 1891). These are about the most difficult of all plant diseases to diagnose or remedy. In the present case, all the falling parts contain an immense number of minute spore-like bodies, but without spontaneous motion. Externally on all decaying portions a delicate white "bloom" indicates the presence of a white mould, with thin verticillate branches and small elliptical conidia (about  $5 \times 3 \mu$ ). Doubtless this mould is a saprophyte, and occurs only on the decaying tissues. The speedy decay of all the parts attacked is accompanied by a strong foetid odour. Although only a prolonged investigation can fully determine this disease, it seems to indicate a condition of bacteriosis. We can only suggest the application of Bordeaux Mixture or some other similar fungicide, although we fear that the disease is too deep-seated to be affected by any external application. *M. C. C.*

**CYCLAMEN WITH "DOUBLE" FLOWERS:** *J. M. K.* A fine example; still, we hope that the Cyclamen will not be spoiled by endeavours to perpetuate doubling.

**FIVE GARDENERS' DUTIES:** *Anxious.* It would be proper to give the head gardener the control of the other four men, making him solely responsible for the work of the garden and houses, and their condition. He should take a share in the manual labour, that is, he should perform much of the pruning, certainly that of the wall and espalier, bush, pyramid, and cordon fruit trees, Roses, flowering, deciduous, and evergreen shrubs, or at the least look closely after work of this nature. The work in the houses and pits should be primarily under his direction, but carried out by his second in command, who should have occasional assistance from one or several of the other men when the work requires it. The head gardener should also take a hand in the houses as a matter of regular practice, and this can be easily done, if the garden is not remote from them, without neglecting the superintendence of the work elsewhere. The rest of the work should be apportioned between the other men, getting the mowing, sweeping, and general clearing up in the gardens and walks just round the dwelling finished up before 10 A.M. It may be taken that, as a rule of general application, the labour must be massed where it is most required; but these are matters which can only be decided by the responsible head man, and to him alone the apportioning of the duties of the gardeners ought to belong.

FIG. 110.—*CYNIPS QUERCUS RAMULI*: WOOLLY OAK-GALL.

**LAURUSTINUS:** *H. M.* The variety with flowers which are sometimes rose-coloured before they open and for a short time afterwards is *Viburnum Tinus*; the type *V. T. virgatum* has oblong-lanceolate leaves. We do not recognise the plants from your description of them. There are five varieties of *Viburnum Tinus*.

**LEAF DISEASES:** *D. N. J.* The Orchid leaves are diseased from some faulty cultivation, probably. The Peach leaves have been scalded by the sun shining on the leaves while wet. The Carnations are attacked with eel-worms. Burn the affected parts, and get fresh soil.

**NAMES OF FRUITS:** *A. S., Barnet.* Apple, Tower of Glamis.—*X. Y. Z.* Apple sent to be named a week or two ago, and address of sender mislaid, was *Mère de Ménage*.

**NAMES OF PLANTS:** *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*J. H. Ball.* Leaf of some Umbelliferous plant, which we cannot name without a good specimen with fruit.—*H. H. D.* 5, *Saxifraga tricuspidata*; 7, *Sedum spathulifolium*.—*H. T.* *Iberis corifolia*, with short linear-ovate or spoon-shaped leaves, the petals dead white, broad and deflexed, so that those of one flower overlap those of the flower beneath. The spelling of the name varies much, that above given is in conformity with that in the *Index Kewensis*. 2, *Iberis sempervirens*, leaves linear-oblong, petals narrow, spreading, or only slightly deflexed.—*R. B.* *Prunus Padus*.—*P. P.* *Cattleya Mossiae*.—*T. W.* 1, *Nandina domestica*; 2, *Spiraea Thunbergiana*;

3, *Magnolia acuminata*; 4, *Spiraea prunifolia*, double; 5, *Akebia quinata*.—*H. B.* 1, *Gomezia planifolia*; 2, *Asperula odorata*; 3, *Sedum Rhodiola*; 4, *Campanula muralis*; 5, *Cereus speciosissimus*; 6, *Viburnum Lantana*.—*R. C. F.* *Cephalanthus ensifolia*.—*G. D.* *Pruus Padus*.—*T. F.* *Dendrobium formosum giganteum*; and the other next week.—*Paddy from Cork.* *Phlomis lanata*, a South European Labiate.—*Nemo.* 1, *Daphne Cneorum*; 2, *Daphne collina*; 3, hybrid *Azalea*; 4, *Cerastium*; 5, *Phlox subulata* var.; 6, *Cheiranthus ochroleucus*; 7, *Asperula odorata*; 8, *Euphorbia Cyparissias*; 9, *Lithospermum purpureo-ceruleum*; 10, *Elymus glaucescens*. Another time do not send more than six.—*H. B.* 1, *Spiraea confusa*; 2, *Genista aetensis*; 3, *Manettia bicolor*.—*E. H. C.* 1, perhaps an alpine Willow, *Salix repens*; 2, *Amelechier vulgaris*; 3, *Cytisus purpureus*; 3bis, *Polygala chamaebuxus*. There were two plants labelled 3.—*J. M.* *Hesperis tristis*.—*T. C.* *Menyanthes trifoliata*.—*Joe.* 1, *Ornithogalum umbellatum*; 2, *Agathea celestis*; 3, *Pulmonaria officinalis*; 4, *Magnolia Soulangeana*.—*H. G.* *Cattleya gigas*.—*J. C.* 1, *Cercis siliquastrum*; 2, *Cytisus*; 3, *Spiraea callosa*, *Cytisus Adami*, supposed to be a graft hybrid between the *Laburnum* and *Cytisus purpureus*.—*S. M.* *Bougainvillea glabra*.

**PURPLE BEECH:** *H. M.* As in the case of other trees grafted out-of-doors, the stock should, in regard to growth, be in advance of the scion; and to ensure this being so, the latter should be taken off in February and laid-in in a cool shady border till required. The Beech, being rather late in leafing, may be worked early or late in April, according to the character of the season.

**SEEDS:** *T. F.* Seeds of *Ormosia coccinea*, a tropical climber.—*A Subscriber to Gardeners' Chronicle.* A species of *Pyrus*, probably japonica.

**SPOTTED CYPRIPEDIUM LEAVES:** *E. H. A.* These leaves are not affected by any internal disease. The spots are caused by something external. In each case spots occur at exposed places, but in no instance where the imbrication of the leaves shelter the part beneath. It is remarkable that, looking down upon the leaves, these spots are only to be seen on places fully exposed to the light, and wherever the projection of a leaf places the one beneath it in shadow there is no spot. This fact is so evident to any one looking down upon the leaves that it conveys the impression of some poisonous fluid having been sprinkled on the leaves. This fact is inconsistent with the idea of any organic disease, for in that case it would develop itself everywhere irrespective of whether the leaf were sheltered from the light by the leaf above or not. *M. C. C.*

**THRIPS ON VINES:** *Foreman.* The article mentioned will not harm the Grapes. Two applications may, however, be needed.

**TOMATOS:** *Margaret* and *G. B.* Too well-known—a fungus. Spraying with Bordeaux Mixture earlier in the season might have been of service. Often described and figured in these columns.

**TULIPS:** *B. S. W. & Co.* The Tulip bulbs are in a remarkably vigorous and healthy condition, but the foliage is in a poor state. We can find in them no trace of fungi or specific disease. Nothing in the plants themselves can account for the failure in flowering. *M. C. C.*

**WOOLLY OAK-GALL:** *D. C.* Produced by *Cynips quercus ramuli* (see fig. 110).

**COMMUNICATIONS RECEIVED.**—*J. H. B.*—*J. C. & Co.*—*T. W.*—*Sif C. S.*—*T. F.* (next week).—*H. G. H.*—*W. Goddard.*—*F. P.*—*P. W.*—*J. McDonald.*—*D. T. F.*—*C. W. D.*—*E. C.*—*J. Mel.*—*A. D.*—*C. R. D.*—*Messenger & Co.*

**PHOTOGRAPHS, SPECIMENS, &c., RECEIVED WITH THANKS.**—

**CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."**

**IMPORTANT TO ADVERTISERS.**—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,*

**Increased to the extent of more than 90 per cent., and that it continues to increase weekly.**

*Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.*

## NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, consequent on the large increase in the circulation, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

### Plants for the Garden.

**H. CANNELL AND SON** have for a great number of years been known to possess the largest and completest stock of the above, and will be glad to quote or send their Floral Guide free, stating prices. Their Nurseries are now very beautiful. All lovers of good gardening are asked to "come and see." Pelargoniums are now a grand sight. **SWANLEY, KENT.**

**CALCEOLARIA.**—GARAWAY & Co. offer Seed of the finest Herbaceous Calceolaria (Rapley's)—see Gardening papers—at 1s., 1s. 6d., and 2s. 6d. per packet. **GARAWAY AND CO., Clifton, Bristol.**

**CARMINE PILLAR and SINGLE ROSES.**—Fine Walls and Pillars of this new Single Rose, as well as many species, ARE IN FLOWER at **PAUL AND SONS, The Old Nurseries, Cheshunt.**

**PRIMULAS! PRIMULAS! PRIMULAS!** 26th year of Distribution. Williams' Superb Strain, 1s. 6d. per dozen; 10s. per 100. CINERARIAS, same price; also, PRIMULA OBSCURIA, 2s. 6d. per dozen; DOUBLE WHITE PRIMULAS, 6d. each. **JOHN STEVENS, The Nurseries, Coventry.**

**HENRY RIDES, SALESMAN, Central Avenue, Covent Garden, W.C.** Highest Market Prices. Prompt cash.

**SUTTON'S PERFECTION CALCEOLARIA.**—By continually crossing the finest types of flower, we are able to ensure great diversity and richness of colour, and we continue to save seed from the choicest flowers only, produced on plants possessing the dwarf and vigorous habit for which our strain has an established reputation. Mixed colours, per packet, 3s. 6d. and 5s., post-free.

**SUTTON'S PERFECTION CALCEOLARIA.**—The Rev. Robt. Hole, North Tawton, says:—"My Calceolarias are surpassingly beautiful from your strain—short, bushy plants crowned with masses of large flowers of every imaginable hue. I have seen nothing to equal them, and this is the unanimous opinion of all who have seen them."

**SUTTON'S SEEDS GENUINE ONLY DIRECT FROM SUTTON AND SONS, THE ROYAL SEEDSMEN, READING.**

**DICKSONS SUPERB WALLFLOWERS.**—Golden Beauty, Primrose Dame, and Selected Dark Blood-Red are the best single varieties in cultivation. Each 6d. and 1s. per packet, or 2s. 6d. per ounce. Choice mixed Tall and Dwarf Double German varieties, 6d. and 1s. per pkt. **DICKSONS, Royal Seed Warehouse, CHESTER.**

**KENT, THE GARDEN OF ENGLAND.**—GEORGE BUNYARD & Co., The Royal Nurseries, Maidstone, are the largest growers and the best cultivators of fruit trees. CATALOGUE, six stamps. 800 kinds, true to name.

**JOHN NATHAN, Covent Garden Market,** is open to RECEIVE CONSIGNMENTS of Strawberries, Peaches, Nectarines, Melons, Grapes, &c. Terms, 5 per Cent. References, London and County Bank, C. O. Branch. Sales accounts daily; cheques weekly. Telegrams: "Nuntiator, London."

**NOW is the TIME to PLANT Gladiolus-flowered Cannas, Gaillardias, Delphiniums, & Pyrethrums.** Catalogue of **KELWAY AND SON, Langport, Somerset.**

**LARGE PALMS & DECORATIVE PLANTS.** Immense Stock. All sizes up to 20 feet for Sale or Hire. Inspection invited. Prices on Application. **B. S. WILLIAMS AND SON, Victoria and Paradise Nurseries, Upper Holloway, London, N.**

100 Plants of CATTLEYA AUREA, also about 150 Plants of ODONTOGLOSSUM ALEXANDRE in flower and bud.

May be viewed any day prior to the Sale on application to Mr. G. Roberts, the Gardener. Catalogues may be had on the premises, and of the Auctioneers and Valuers, 67 and 68, Cheapside, London E.C.

Friday Next, June 5. By order of Messrs. F. Sauer & Co.

MESSRS. PROTHEROE AND MORRIS will sell by AUCTION, at their Central Auction Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, June 5, at half-past 12 o'clock.

VARIOUS SELECTIONS OF IMPORTED ORCHIDS, including a consignment of a DENDROBIUM SPECIES, most remarkable looking plants, found growing near D. sanguinolentum, but they are evidently quite distinct from that species. The flowers were not seen by the Collector, but the old flower-spikes are borne at right angles to the stems at their tops, and show from fifteen to twenty flower-seats. Every one received is offered, and they are in grand order.

DENDROBIUM NOBILE, LANG TANG Var.—The finest of all. A consignment just to hand, and containing many fine specimens.

DENDROBIUM CLAVATUM, D. CARINIFERUM. GRAMMATOPHYLLUM MEASURESIANUM, COELOGYNE OCELLATA MAXIMA.

A PHALENOPSIS SPECIES, either P. Duboyssoniana or P. Esmeralda. The flowers are bright purple, borne on erect scapes.

A COELOGYNE SPECIES from Upper Burma. Very distinct-looking plants, with conical-flowered bulbs on stout rhizomes, and foliage resembling that of C. Dayana.

A CYPRIPEDIUM SPECIES, found growing near C. Curtisii, but with brightly-marked foliage.

VANDA CEBULEA, DENDROBIUM DENSIFLORUM, CYMBIDIUM Eburneum, ONCIDIUM IRIDIFOLIUM (?), THUNIA BENSONLE, DENDROBIUM AUREUM, VANDA PARISHII, CYPRIPEDIUM VENUSTUM, BURLINGTONIA FRAGRANS, TRICHOSMA STAVIS.

CYPRIPEDIUM INSIGNE MONTANUM, Sanderae section. MILTONIA MORELLIANA, atro-rubens type.

A COELOGYNE SPECIES—The flowers are said to have white sepals and petals, and chocolate markings on the labellum, and are highly fragrant.

On view morning of Sale, and Catalogues had.

WANTED, good Second-hand 4-inch HOT-WATER PIPES and CONNECTIONS; also a quantity of small ordinary WATER PIPE, about 1/2 and 2 or 3-inch. Address, O. E., care of Wm. Dawson & Sons, 23, Craven Street, Strand, W.C.

WANTED, to BUY Cheap, an Old-fashioned HORSE-LAWN MOWER, to improve a piece of bad turf.—Address, REYNELL-PACK, Netherton, near Newton Abbots.

TO FRUITERERS and FLORISTS.—An unexceptional offer of a Genuine BUSINESS. Been under Female Management. Health giving way cause of selling.—Apply, 58, Willesden Lane, Brondesbury, N.W.

FLORIST'S BUSINESS for SALE.—Good neighbourhood, a few doors from station. Rent low; good living trade; same hands thirteen years. Cause of selling, ill-health. Any further particulars, apply to—Messrs. NEWELL & RAMLYN, 487, New Cross Road, S.E.

To Gardeners, Florists, Fruiterers, and Others. TO BE SOLD, the LEASE, WORKING-PLANT, and CROPS, at the GREAT LODGE GARDENS, Tunbridge Wells.—Been established nearly 20 years. Only requires to be seen to be appreciated, and every information will be given. Good reasons for selling. For further particulars, apply to RICHARDSON and GARAWAY, Auctioneers and Estate Agents, 30, Mooson Road, Tunbridge Wells.

Nursery for Sale.

TO BE SOLD, as a Going Concern, a compact MARKET NURSERY, all glass, consisting of 11 Houses: 8 Houses, 45 feet by 12 feet; 1 House, 45 feet by 25 feet; 2 Houses, 65 feet by 25 feet; well-heated with 4-inch pipes, worked by two powerful Rochford Boilers. Nineteen years' unexpired lease.—Ground-rent, £15 a year. Seven miles from Covent Garden.—For further particulars, apply to W. A. CULL, Northumberland Park Nurseries, Tottenham, London.

HADLEIGH, SUFFOLK.—TO BE DISPOSED OF, the Lease, Goodwill, Stock in Trade, and Glass Erections, &c., of above NURSERY, comprising about 13 acres of Land, convenient DWELLING HOUSE, Packing and Potting Sheds, SEED SHOP, and Fittings. Lease about nineteen years unexpired. Rent £27. No other Nursery within several miles. Price £150. Apply to—WILLIAM BADMAN, Cemetery Nursery, Gravesend.

TO BE LET, on lease, within 15 miles of London, a NURSERY and FRUIT-GROWING BUSINESS. Price, stock, &c., about £250. Address, for full particulars, "NECTARINE" Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

Royal Agricultural Show, Leicester.

FURNISHED HOUSE TO LET, or in APARTMENTS, with attendance: two sitting and six bedrooms; ten beds if required. Price for whole, 30 guineas for week; 35 guineas ten days.

5, Victoria Road, near Midland Station.

BOX'S BEGONIAS, for quality and quantity, are unequalled; obtained highest award for Begonias exclusively at the Temple Show. Exhibition, June 1st September, at West Wickham Nursery, near Station. A visit solicited. JOHN R. BOX, Croydon.

SPECIAL OFFER.—Raspail Geranium, 6s. per 100; Calceolaria Golden Gem, 4s. per 100; Lobelia Empress William, 2s. per 100; L. primula magnifica, 2s. 6d. per 100; Verbena, mixed colours, 4s. per 100; White Marguerite, 4s. per 100; Coleus, in 25 varieties, 2s. 6d. per 100; C. Verschaffeltii, 6s. per 100. Free on rail. Cash with order. P. BOULTON, Beechenlea Nursery, Swanley.

EXHIBITIONS.

CHESTER HORTICULTURAL SHOW and FETE—AUGUST 5 and 6, 1896. Upwards of £400 in HORTICULTURAL PRIZES. For Schedules apply to the Hon. Secretary—Mr. J. WYNN FFOULKES, Crypt Chambers, Eastgate Row, Chester.

CLAY CROSS HORTICULTURAL SOCIETY. THIRTY-NINTH ANNUAL SHOW, August 11, 1896. PRIZES, £275. Schedules may be had on application to—Mr. G. LAMB, Clay Cross.

CARDIFF HORTICULTURAL SOCIETY. President—The Worshipful the MAYOR of CARDIFF. (The Right Hon. Lord Windsor). The EIGHTH ANNUAL SHOW will be held in the Cardiff Exhibition Grounds, on August 12 and 13 next. For Schedules, &c., apply to—66, Woodville Road, Cardiff. H. GILBERT, Secretary.

MUNGO CHAPMAN, late of Easter Duddingston Lodge, Mid-Lothian, begs to intimate to his friends and acquaintances that he retires from his present situation on the 20th of the present month. He has arranged to reside at St. Ninians, near Stirling, where he intends to commence the Cultivation and Sale of Hardy Plants on his own account.

With the experience gained during twenty-four years in the management of one of the most choice private collections of plants to be found in the British Isles—that of the late Charles Jenner, Esq.—Mr. Chapman can confidently undertake to supply what is select and true to name of the most suitable plants for Borders and Rock-work.

He hopes to be able soon to issue a Plant Catalogue, from which customers may make their own selection. In the interval, he will be fully employed in getting up Stock. May 19, 1896.

FOR ORCHIDS and GARDENERS to Grow them, apply to SANDER'S, St. Albans. The finest stock of Orchids in the World.—30 minutes from St. Pancras.

PELARGONIUMS.—GARAWAY & Co. offer good plants, in 5-inch pots, of the best market and decorative varieties, at 1s. per dozen. GARAWAY AND CO., Clifton, Bristol.

**THE 57th ANNIVERSARY FESTIVAL DINNER**, in Aid of the Funds, will take place at the "Hotel Metropole," on **SATURDAY MAY 30, 1896**, when the **Right Hon. the EARL of LATHOM, G.C.B., F.C.**, will preside. The Committee have the pleasure to announce the following further amounts, which have been promised or received, and added to the Chairman's List:—

Per N. SHERWOOD, Master Elect of the Worshipful Company of Gardeners:—

Randolph Fritz ... £1 1 0	G. Maycock ... £2 2 0
J. Smith ... 1 1 0	K. Jones ... 2 18 6
Henry Wood ... 3 3 0	J. Hurton per W. Bennett, (annual) 1 1 0
C. E. Osman ... 1 1 0	Earl of Cork & Orrery, per A. Young ... 5 0 0
H. Pyle ... 2 2 0	Mrs. Graham, ditto 0 10 0
Alfred Fuller ... 1 1 0	T. H. Crisp ... 21 8 0
Charles Beart ... 0 10 6	F. J. Mermelles, per Geo Payne ... 1 1 0
C. E. Goldsmith ... 0 10 6	Hon. F. C. Farrer ditto ... 1 1 0
Alexander Clark ... 2 2 0	F. Seaton, ditto ... 0 10 6
Chas. J. Percival ... 2 2 0	J. Cos, ditto ... 0 10 0
H. Butler ... 1 1 0	Anon., ditto ... 0 10 0
R. L. Devonshire ... 1 1 0	Rev. E. Dean, ditto 0 5 0
Gen. Turner (annual) ... 1 1 0	N. C. Cookson, per W. Murray ... 1 1 0
R. Inman (annual) ... 1 1 0	E. P. Dixon ... 0 10 0
R. Curtis ... 1 1 0	W. J. Sanderson, ditto ... 1 1 0
A. Housset ... 1 1 0	R. S. Newall, ditto ... 1 1 0
V. Benoit (annual) ... 1 1 0	C. Clayton, ditto ... 0 10 6
B. Shephard ... 1 1 0	W. Murray, ditto ... 1 1 0
E. P. Dixon ... 3 3 0	M. Manghau, ditto ... 0 5 0
J. Howson ... 1 1 0	C. Parsons, ditto ... 0 5 0
Hugh Aiton ... 2 2 0	W. G. Head ... 1 1 0
J. H. Andrews ... 1 1 0	Verditto ... 5 5 0
Percy Mason ... 2 2 0	W. Rapley ... 2 1 0
F. E. Gibbs ... 1 1 0	N. F. Bates ... 5 14 9
Chas. Welch ... 1 1 0	E. Harrison ... 1 1 0
W. R. Buggers ... 1 1 0	J. Barclay ... 1 1 0
R. David & Co. ... 2 2 0	E. Harrison ... 1 1 0
H. Jacobs ... 2 2 0	
Sir William Farmer ... 2 2 0	
Jas. Lee ... 2 2 0	
Bon Smith (annual) ... 2 2 0	
Wyndham Hart ... 5 0 0	
J. W. Ounn ... 1 1 0	

Additional contributions will be most thankfully received and duly acknowledged by the Secretary—**GEORGE J. INGRAM**, Offices: 50, Parliament Street, London, S.W.

## THE Gardeners' Chronicle.

SATURDAY, MAY 30, 1896.

### SMYRNA AND NEIGHBOURHOOD.

**D**URING a stay of a month or so at Smyrna, involving numerous excursions into the surrounding hills and vales, mountains and gorges, I have seen so much of their present wealth of flower and promise of future fruits, that I think a few notes may be of interest to your readers.

Smyrna is the centre of the dried fruits industry, Figs and Sultanas especially, and we consequently find the broad plain, on the edge of which the town (200,000 inhabitants) stands, to be covered over a large part of its extent, with the small Vines which bear the diminutive Sultana Grapes. Most of these Vines are evidently very old plants, with short thick stocks kept down by vigorous pruning to about 1 foot, and placed at intervals of about 6 or 8 feet. At this moment (April 28), the new growth is rapidly becoming conspicuous, bearing the incipient fruit in abundance, and this growth will speedily cover all spaces with a continuous sheet of verdure. The young leaves of these Vines are gathered and sold for table purposes, chopped meat being wrapped up and cooked in them, deriving therefrom a pleasant acidulous flavour. Among these Vines in many instances are found the Fig and Olive trees, though usually these are in separate orchards. The Fig here is a tree, and not grown vine-fashion as in England; it usually has several short trunks, and is evidently kept well down by pruning. The light grey smooth bark gives the bare trees a very dead look before the leafage appears. These trees are monoecious, and it is the custom to collect the small male Figs and hang them about among the female trees; a brood of flies is generated in the male fruits, and these escaping fertilise the others. The Olive trees must in many cases be of immense age, their huge gnarled, twisted, and knotty trunks being often quite out of proportion to the mass of their dark grey-green foliage. Gustave Doré evidently derived the weird and fantastic presentations of foliage so often seen in his drawings from the Olive, figuring, as it does, almost as prominently in the landscapes of Southern France as here. Oranges and Lemons thrive here, and fruit in abundance. The blossom is just commencing to open, and will flood the air with its perfume in the next fortnight; meanwhile, the fruit, where unpicked, is still in perfection on the boughs. The Orange trees are small and densely leafy, the fruit being all outside. The Lemon is of more open growth. Almonds and Apricots are plentifully grown, and here and there Pomegranates. The Apple, Pear, and other British fruits, are conspicuous by their absence; they do not do well. The Strawberry, however, is well to the fore in the gardens, and already beginning to be gathered. Of their quality I have had no opportunity of judging. Great use is made of the Arti-

choke, which, once established, yields a perennial crop, and only requires keeping in bounds. It figures at almost every meal.

The climate from now on is normally all but rainless for six months, and becomes extremely hot in July and August; though since I have been here 7° of frost have been registered. This cut some of the Vines in exposed situations, but otherwise I have seen no sign of damage, though Agaves are plentiful, and Palms of several species (Washingtonia, Chamærops, &c.) grow splendidly in the open. The shoots of the wild Hop are collected and boiled for the table, and are very palatable. Mustard is the weed of the district, its yellow flowers appearing everywhere; it does not, however, seem to be utilised.

Leaving the cultivated plain and taking to the hills, the wild flora is speedily seen to be extremely rich. Unfortunately, I arrived too late for the bulk of the spring bulbs, though happily, as we shall see, I found a capital substitute for their observations *in situ*. The common field Poppy is very plentiful, but of an intense crimson, as distinct from the scarlet of our home flower. With these on the hill-slopes, scarlet and blue Anemones are intermingled. The prevailing drought of the year is doubtless the reason that Ferns are generally scarce, though I hear they are locally abundant where springs or streams secure persistent humidity. *Ceterach officinarum* is naturally at home, and frequents the chinks of rocks in many places, and curiously enough, I found *Gymnogramma leptophylla* associated with it in one case. So far, a *Lastrea*, unfortunately unaccessible, is the only other species met with to date.

As regards the entire flora, it is overwhelmingly rich, as by the courtesy of Mr. Edward Whittall I have had a splendid opportunity of judging. This gentleman, one of the chief merchants of Smyrna, has for years devoted his leisure to the collection of indigenous plants, a number of which have been recognised by Kew as not only new, but valuable acquisitions to the horticultural world. In his garden I found growing a great variety of bulbous plants, to which I propose specially to refer, while indoors I was regaled with the perusal of over a dozen thick volumes containing the dried flowers and specimens of these and other genera collected within a radius of some 300 miles or so. The names as given are all derived from Kew, to whom specimens are regularly sent, and many of which I noticed were starred as desirable for the growing collection there.

The Snowdrop (*Galanthus nivalis*) appears in very varied forms, dwindling in size as it goes southwards, warmth evidently dwarfing it. *G. Elwesii* appears as a larger variety, about a foot high, associated with the normal form. On Mount Ida a very fine broad-leaved variety, with a tendency to yellow, occurs on the slopes, and has been named *G. E. var. oebrospeila* (?). Near the summits of mountains of the Tmolus range, 4,500 feet up to 6,000 feet, this variety grows 18 inches high, with much larger flowers than *G. Elwesii*, and broader and erecter leaves, the bulb is also long instead of round. This, Mr. Whittall has named *G. cassabarensis*, after the locality, and it would certainly be a great acquisition among our spring bulbs. I saw the foliage, and as it was growing under precisely same conditions as the smaller forms accompanying it, its form is obviously not due merely to soil or position. It is certainly distinct, and grows, moreover, in marshy ground, which the normal form does not.

Near Smyrna is found also *G. unguiculata*, as named at Kew, very floriferous, and bearing

often two flowers on one stem. Another variety also occurs, so far unnamed. This is akin to *G. cassabarensis*, but bears more globular flowers, and wider, often inch-broad leaves. Finally, *G. Ikarie* is another fine form, and, according to Kew, quite new. This has very white and waxy flowers, and glossy green leaves, and seems adapted for hot situations. *Leucojum aestivum*, about 18 inches high, figures only in one form, and that is normal.

The *Chionodoxas* grow in profusion, and, as may be expected, have yielded numerous varieties. *C. sardensis* and *C. Luciliae* are the species, and Mr. Whittall informs me that not unfrequently hybrids between *C. Luciliae* or *sardensis* and *Scilla bifolia* occur, the flowers being intermediate. The dried specimens I saw of the varietal forms showed much range in size and colouring. A form called *C. L. Tmolusii*, very dwarf with bright flowers, grows in snow-water on Mount Tmolus absolutely in caves of snow, which accumulates to a great depth in the upper gorges. It blooms in dense masses with bulbs no larger than peas, but curiously enough its diminutive size cannot be wholly imputed to environment, as a very large form of *C. L. gigantea* accompanied it. *C. Alleni* is a distinct rosier form of *C. Luciliae*, and so large as to be classified as *gigantea*, the bulbs of which latter are, however, reddish instead of brown, like those of *C. Alleni*, and also longer in shape. A lilac-pink self-coloured *Chionodoxa* has also been found by Mr. Whittall, but this, so far, has not been introduced; it occurs some 200 miles from Smyrna, and would be a desirable acquisition. Pink and white, and also double varieties have turned up, but the latter, unfortunately, perished, or possibly lost character on removal. A form of *Galanthus*, with eight petals and no cup, shared a like fate. *C. T. Druery*.

(To be continued.)

## THE LARCH DISEASE.

(Continued from p. 584.)

ACCORDING to promise, I shall now summarise the various statements made in my former articles on this subject, assigning reasons by way of proving some of the more important but obscure points upon this very important subject.

1st. That it is on the young, immature bark of the tree, which is affected by frost and moisture in the spring of the year, that the blister is produced. I have with great care, dug up trees of different ages quite leprous with blister, and found the roots, the neck of the plant, and a portion of the stem joining the root, quite sound and healthy. It is also a very common thing to find trees producing shoots from the lower part of the stem, below the blisters, and these shoots afterwards producing healthy trees, all of which combine to prove that it is not any constitutional defect in the tree which causes blister, nor because it was raised from seed from diseased trees, &c.

2nd. That the blister takes effect upon the bark up to that stage only, and never beyond, where it puts on the corky scaling covering, which in all future stages of growth effectually prevents its occurrence.

3rd. Out of a hundred sections of wood cut from vitally-diseased trees, only one section showed the disease as having originated in the bark at over fourteen years' growth, and the wound shown on that exceptional section gave strong presumptive evidence of having been the result of an accident such as that of another tree falling against it, a gun-shot, or perhaps the work of a squirrel, rather than having been produced by frost and damp in the usual way. By referring to the issue of April 4, 1896, p. 434, fig. c, it will be seen that the disease took effect when the tree was making its fourth or fifth year's growth, and continued growing for two years longer, when, it appears the tree was cut down. Fig. b was attacked

at the third year of its growth, and continued growing for five years when it was cut. The branch a shows the blister all over the surface of the bark, and is evidently of long standing, but at what age it was affected cannot be known, as the rings are of course concealed.

4th. That the wound originally made in the bark extends to the wood underneath, and eats into the solid wood so as to form a cavity in it, is almost wholly illusory, and is produced in the following manner. The cambium because of the wound on the stem has now less surface of the tree to cover than before, and is consequently much thicker at both sides of the wounded part than it otherwise would be. The new-formed wood closely resembles the lips, gradually enclosing the wound or mouth. This, however, is much better understood by looking at the figures referred to than by any description that can possibly be given.

5th. That the blister is not the result of frost as is generally supposed, but may be seen on trees in many localities, clearly demonstrating the difference. Where frost occurs after the tree is in leaf, it acts upon the branches and leading top-shoots, by beginning at their extremities and taking effect backwards, killing the entire branch or leading top-shoot as it proceeds. On the other hand, the blister, whether upon top, branch, or stem, affects the tree in quite a different way, by producing spots at intervals here and there all over the tree, sometimes in one form and sometimes in another, and in certain cases where it appears as if the whole upper part of the tree was uniformly killed, as by frost, it is not so, but the cause of such death is produced by the wound in the bark extending quite round the stem and thereby stopping the circulation of the sap, and killing the tree or part of it. When the branches of a tree are killed, either by frost or any other means, one common result is that resin is produced in clear, thin globules near the base of the dead branch, and which, as the season's heat intensifies it, becomes more copious and liquescent, and runs down the stem of the tree in unsightly streams.

6th. Severe droughts, cold, hard, dry winds, or frost, brown the foliage, and deprive the sprigs or spray of their vitality; but if they still possess sufficient recuperative power, they only die back to such a point, as there is strength in, to reproduce a new series of shoots; and the tree after, perhaps, a prolonged struggle, yet attains the true character and dignity of a tree, and grows and flourishes as if nothing had happened.

7th. The Larch, while at once the most tender and easily injured of all our common forest trees in respect to its bark, is yet the most tenacious of life of any of them, and will grow to a stately tree in the poorest soil, and in situations, and at altitudes where the Scots Pine is only a worthless creeping shrub.

8th. It is scarcely worth while to call in the physician only to tell the patient or his friends that he is unwell, and likely soon to die under his complaint. It is to be hoped that the doctor at least could administer something for the relief, if not for the entire recovery of the patient. In like manner, if we have at all properly diagnosed the disease of the Larch, let it be hoped that at least some small modicum of good may come out of it to prevent such disastrous results as we are but too familiar with, whether in the culture of the tree as a pleasurable luxury, or in growing it for economical purposes. Frost, combined with dampness, is doubtless destructive to the tree, which indicates that cold soils, cold situations, and cold climates should be avoided, and the opposite conditions carefully chosen and adhered to. Excess of moisture is also fatal to the tree and must likewise be studiously avoided. If true, as I have endeavoured to show, that the Larch is one of the hardiest of all our forest trees, why then are all these precautions and provisions to be made for its safety? The reason of this is, that the Larch tree, like most, if not all other things, has its weak points and its strong ones. Its weak points are its bark, at the sap-flowing period of its growth, namely, April or May, and its strong ones in its power to resist intense winter frosts, and withstand our lowest temperature, suffering nothing

either in its root, stem, bud or branch, from the elements. More items may still be forthcoming at a future time, meanwhile I have said (however imperfectly it may be) most of what I intended to say on the subject. *C. Y. Michie, Cullen House, Banffshire.*

TREES AND SHRUBS.

CYTISUS SCOPARIUS ANDREANUS.

THIS, as its name implies, is a variety of the common Broom (*Cytisus scoparius*), from which it differs in the colour of its flowers, which have a rich bronze-coloured blotch upon their wings. It possesses a charming appearance when in blossom, which it does as freely, even in quite a young state, as the type. The plant is well adapted for planting in masses together, and thus treated in suitable positions, it makes beautiful features. Flowering simultaneously with the common variety, it succeeds our earliest flowering species of shrubs, such, for instance, as *Forsythias*, *Malus floribunda*, *Prunus Pissardi*, *P. triloba*, *Berberis Darwini*, *B. stenophylla* x, &c. I conclude that it can be raised true from seed; but however this may be, it appears to be quite as hardy and free in growth as the more common varieties.

THE WHITE PORTUGAL BROOM, *CYTISUS ALBUS*, although not so showy as the foregoing, is nevertheless very pretty when in blossom. Its long racemes of small white flowers, arranged, as they are, upon slender, grass-like shoots, have a graceful effect. This variety also flowers freely in a young state, and is most attractive when planted in masses.

BERBERIS STENOPHYLLA x.

This beautiful flowering shrub is, according to Mr. G. Nicholson, a hybrid between *B. Darwini* and *B. empetrifolia*. It much resembles the former, flowers about a week later than that old favourite, and is certainly one of the best, if not the best, of the numerous family to which it belongs. It rivals *B. Darwini* for ornamental planting, inasmuch as its flowers are equally rich in colour; it is also equally floriferous, while it is quite as hardy, and its habit is more graceful. For planting in the foreground of large shrubberies, or for forming clumps, it is very suitable; but perhaps it is seen to best advantage as specimens, in open situations, upon massive rockeries, or upon lawns, where its long curved shoots, with their neat foliage, and abundance of flowers, may be seen in their greatest beauty. Like many of its genus, it is not over-particular as to soil, and grows free in both heavy and light loam. *Thos. Coomber.*

LONDON IN MAY.

VICTORIA PARK, SATURDAY AFTERNOON.—If there are any still among us who doubt the educational, social, and sanitary advantage of such fine open spaces as this park and the adjoining common affords, one visit on a Saturday would surely suffice for their conversion. The ample open spaces, the well-furnished parks and gardens, with their supply of seats, are crowded with their thousands of happy men, women, and children, in search of health, happiness, and the higher education of sweetness and light which close fellowship with Nature at her best cannot fail to impart. Surely never was there such a rich spread of tree, leaf, and flower beauty than was to be seen here throughout this May-tide in London. The progress made by the larger trees in this park, especially round the lake, is marvellous. Oaks, Elms, Planes, Beeches, drooping Willows, and many others form verdant or other sky lines of many shades of verdure, whilst the golden drapery of the Laburnums, the flowering Chestnuts, the mass of many colours from China-white to ruddy-crimson and glowing pink vie with each other in the beauty and prodigality of their blossoming. The more dwarf shrubs such as *Lilacs*, *Weigelas*, *Rhododendrons*, *Guelddres Roses*, were in full beauty, while *Japanese* and other *Roses* were

beginning to follow suit. There were still also many flowers and a few good Tulips left, though the bulk of the bulbs had faded or had been cleared off. Notable among Tulips about May 20 was a huge bud centred with the orange *Doronicum* broadly banded with the Tulip *Gesneriana*, the whole edged with London Pride or pretty Solomon's Seal, the white *Iberis*, *Lupines*, mixtures of *Stocks* and *Lupines*, grounded on or edged with *Pansies*; while Tulips fringed with bronze *Pansies* were among the showiest flowers. The glory of the *Daffodils* had faded, though sufficient of the double white and *Pheasant-eye* still remained to show what it had been.

FIG. 111.—MECONOPSIS CAMBRICA: DOUBLE-FLOWERED; COLOUR, DEEP YELLOW, IN TEMPLE SHOW.

(This variety, in which the stamens are petaloid, appeared spontaneously in Messrs. Backhouse's nursery.)

Two great features of the Victoria Park pleased me most this May. The first was the teeming thousands of happy faces. The second the silent but sure progress made in the rich clothing and colouring of the lakes. Perhaps a deeper dash and a greater variety of colour, and a little more variety and grace of form might be had in silver and other Maples, purple Beech, drooping Willows, Bamboos, Birches, Grasses, Irises, &c. But the lake, as it is to-day, is a marvellous advance on its primary coldness and bareness for some years after planting, and is an object-lesson full of inspiration and encouragement, showing how plant-life, and growth, and time mellow the raw lines of our lakes and landscapes into grace and beauty. *D. T. F.*

THE BLEEDING OF VINES.

THE bleeding of Vines is a subject which appears to have been studied scientifically as long ago as 1725, and Hales' investigations in this connection are said to have served as an introduction to the determination of the mechanism of the circulation of liquids in plants. It is interesting to note that a translation of Hales' work, which was published in 1727, was made by Buffon, the celebrated French naturalist, in the year 1779. It is, of course, a matter of common knowledge that the fluid which is contained in the albumum, or younger portion of the woody tissue, of dicotyledons occurs in special abundance in the spring, when it flows out freely from incisions made in the bark, and it is this crude sap which becomes converted into elaborated sap in the leaves, whence it passes in various directions, and is used in the cambium and other formative tissue of plants.

It is not the intention to enter fully into the widely-diffused phenomenon of the exudation of sap through "wounded" parts of plants, and which, according to Wieler, occurs in no fewer than 188 species belonging to 135 genera and 65 families. Moreover, the observations which have been made in this connection are so numerous, and the individuality of plants in this respect is so important, that various contradictions are met with in a study of the subject. Reference will, therefore, only now be made to the bleeding of Vines, which, as a particular case of the circulation of the sap, is of special interest as an instance of the great activity which is thereby displayed, of the ascent of watery liquid in plants in the early spring.

There is an instance on record where the total quantity of bleeding by one single Vine-stem amounted to no less than 5 litres (1 1/2 gal.); and although the mass of liquid which may thus be exuded is not rich in manurial matter, it contains a proportion which is by no means a negligible quantity. It is, indeed, this loss of fertilising material which gives more than a scientific importance to the phenomenon of bleeding. Neubauer was the first investigator who made a complete analysis of the liquid which constitutes the bleeding of Vines, and he showed that glucose is present in greatest abundance together with a gummy substance whose composition does not appear to have been yet determined. Next in order are certain contained organic acids (including oxalic and succinic acids), and several organic substances to which further reference will not now be made.

As regards the mineral contents of the liquid, as was shown by Neubauer, and since confirmed by Chuard, lime is present in a very considerable proportion (37.60 per cent.). The three essential constituents of manures viz., nitrogen, phosphoric acid, and potash, are contained in the liquid in the ratio 1, 3, 6; and according to Chuard, these three substances, but potash in particular, are necessary for the growth of the Vine from the commencement of vegetation, and not for the development of the fruit only, as is sometimes maintained.

It has been estimated by the two French observers to be presently named, that a litre (.22 gal.) of the liquid contains, on the average, 2 grammes (1/8 oz.) of dry matter, two-thirds of which is organic and the remainder mineral matter; but that these ratios may vary in different branches of the same Vine. The proportion of mineral constituents would, however, appear to be generally constant as regards the same variety of Vine during the whole period of "bleeding," although the organic contents may vary to a certain extent in this respect.

A very elaborate series of investigations regarding the bleeding of Vines was published in the last volume of the *Revue de Viticulture*, wherein Profs. Houdaille and Guillon, of the Montpellier Agricultural School, discussed the subject, more particularly with reference to the rate of the exudation, and to the various circumstances which affect it; and also with a view to determine the relation of the various climatic influences of different districts. Nor are these investigations without practical interest and utility, because it is admitted that there is a certain loss of fertilising

material when the pruning of Vines is effected within a certain period of the manifestation of "bleeding." In certain soils, and with certain varieties of Vines, the process of grafting may moreover be seriously prejudiced if the "bleeding" be too abundant; and recent investigations tend to show that the application of iron salts as a remedy for chlorosis (*chlorose*)—a disease which is widely prevalent in France—is, in its efficacy, not without relation to the period at which the bleeding of Vines takes place.

It is not possible to describe the admirable methods which were employed in the investigations under reference, or to give more than a *résumé* of the results which were obtained, and of the conclusions which were drawn. The relation between the absorbing power of the roots, which produces an upward pressure in the stem, to the amount and rate of "bleeding," formed an important part of the researches in question. It was observed that different parts of the same Vine "bled" in very unequal quantity, even when the sections were made in stems of the same diameter and at equal distances from their point of origin. This observation was also found to hold good as regards stems of different varieties of Vines of the same age and under identical conditions. The period which intervenes between the commencement of "bleeding" and the opening of the leaf-buds, also appears to vary according to the different conditions of growth, although the main shoots of the same Vine, as a rule, begin to bleed at about the same time.

It was further observed, as indeed seems only natural, that the internal pressure has a correlative effect on the amount of liquid "bled," and that when the pressure decreases, the quantity of the exudation is also less. In other words, the maximum amount of "bleeding" corresponds with the maximum pressure in the stem. Not that this relation can be drawn in a hard-and-fast line, but when both these factors are represented diagrammatically by a series of curves, as is done in the original report, the general truth of this observation is seen almost at a glance. It may be mentioned incidentally that the ascent of the sap takes place almost exclusively through the vessels of the woody tissue, which thus become almost completely filled with a column of liquid, in which are intercalated bubbles of air to which an important function has been assigned in this connection by many physiologists. This part of the subject will, however, not be discussed beyond stating that the effect of this imprisoned air, at any rate as regards the bleeding of Vines, would appear, according to Houdaille and Guillon, to have been much exaggerated. Indeed, they are rather of opinion—because the bleeding of Vines takes place when transpiration by the undeveloped leaves is at a minimum—that the phenomenon is altogether due to the root absorption, and to the simultaneous activity of which they trace the sudden manifestation of the bleeding. The general effect of internal influences having thus been demonstrated, Houdaille and Guillon also investigated the action of external surroundings on the exudation. No direct relation was, however, observed by them to exist between the temperature of the air or of the soil, and the action of bleeding, which, as a rule, begins suddenly, continues at a considerable rate, and then gradually decreases. Nor in their various experiments did they trace, during the period of bleeding, any correlation between changes in the temperature of the soil or air and changes of internal pressure in the stem, their observations tending to show that the diurnal pressure varied generally to a slight extent only, the maximum pressure occurring variously at different hours of the day.

The temperature of the soil would, nevertheless, appear to possess an indirect effect in this connection, and the same observers showed that the manifestation of bleeding occurred in different varieties of Vines only when the soil in which they grew had attained different degrees of minimum temperature. But they are of opinion that it is at this minimum temperature that the commencement of root absorption severally takes place, and to the activity of which, as already stated, they trace the direct cause of the bleeding of Vines.

The observations, of which a *résumé* has been given, do not appear to have included the effect of the humidity of the soil which has long been known to be intimately connected with the subject in question, the abundance of "bleeding" depending to a considerable extent on the amount of water which is available to the root-system of the plant. It may, therefore, be mentioned in conclusion, that Wieler has lately recorded and proved that certain plants, e.g., the Gooseberry and Plane trees, which do not normally show signs of "bleeding," can be made to do so when they are placed in suitable conditions in this respect. The effect of the temperature would, moreover, appear in such cases to have a considerable influence on the exudation, which increases very distinctly with the relative amount of heat. A Vine-plant grown in water has, for instance, been shown by Wieler to bleed four times as much at 35° C. (100° F.) as when the temperature was only 8° C. (58° F.) during the same interval of time. *Vitis*.

## NURSERY NOTES.

MESSRS. HEATH & SONS, CHELTENHAM.

ORCHIDS and florists' flowers are the leading characteristics of this neat and compact nursery, every department of which is maintained in good order by Mr. Treseder, the manager, whose business capacity makes the establishment more widely known than are many others of far greater extent. On a recent visit, we found the Orchids making a very good show with their handsome flowers, among which the Phalenopsis, which are exceptionally well-grown here, were prominent, some of the plants of *P. Aphrodite* having very fine blooms. Recently in flower was the pretty hybrid, *P. × Veitchii*, with its clear rose-pink and white tints, and among others, *P. grandiflora* and *P. Stuartiana*. *Miltonia Roezlii* is also cultivated largely and well at this nursery, and often hundreds of spikes are open at once, and seldom are the blooms of this pretty and fragrant plant absent. One very fine white form, with only a yellow marking on the lip, was in bloom, and many of the purple-marked typical kind. In the houses devoted to Cattleyas, *Laelias*, &c., was a good show of Cattleya Schroderae, one a very pretty white; *C. Mendelii*, *C. Lawrenceana*, *Laelia purpurata*, and other showy kinds; and in an adjoining house a pretty arrangement of well-flowered plants of *Cymbidium Lowianum*, varieties of *Lycaste Skinneri*, *L. aromatica*, &c.

The display in the cool Orchid-houses was chiefly composed of varieties of *Odontoglossum crispum*, *O. Pescatorei*, *O. Hallii*; the varieties of *O. Andersonianum*; the showier *Masdevallias*, among which the hybrid *M. × Heathii* showed up well; and the violet *Odontoglossum Edwardi* and scarlet *Sophranitis*. *Cypripediums* are largely grown, and many hybrids are here in the course of development. One batch fully in flower presented a pretty appearance, although they were held not to be quite up to the mark. The cross was *Harrisianum × callosum*, and the progeny resembled *C. × ceanthum* but with larger flowers, with more or less chocolate spotting on the petals. Some 3,000 seedling Cattleyas, *Laelias*, and *Laelio-Cattleyas* are also in the small stage, and doubtless many good things will result, though probably only a small proportion may mature. One house is nearly filled with *Cœlogyne cristata* and *Cypripedium insigne*, of the best varieties. In another warm and moist house are a fine lot of *Dendrobium Phalenopsis Schroderianum*, and other *Deudrobes*, both species and hybrids. Here, too, in flower is the fine *Cypripedium villosum superbum*, and some good varieties of *Odontoglossum citrosimum*, &c.

In other houses is a fine stock of Tree Carnations, among the varieties a new one, with large and handsome flowers of much the same hue as *C. Miss Jelliffe*, but a true perpetual flowerer. In the houses of Tea Roses is another novelty which will prove of great value to florists, viz., a pink-coloured *Niphotos*, said to have sported from the original. In another house

is a fine show of Azaleas, and with them some very handsome Moutan *Pæonies*, which have been gently forced into early bloom. The many houses devoted to Palms and other ornamental plants and Ferns are all well stocked and neatly kept.

## METHODS OF PROPAGATION.

(Continued from p. 640.)

I PROPOSE to take as my subject now the grafting of ornamental trees, which will enable those who desire to propagate this class of tree in the proper season to make early preparations another year by selecting suitable stocks, and, in some few cases, potting them. Also by the early planting of some in desirable positions in the first days of October, preparatory to putting in buds in July and August, or grafts the following March and April. It frequently happens that in gardens and ornamental grounds there is one tree planted that even to a casual visitor appears something out of the ordinary way; naturally the gardener in charge of this establishment will desire to possess more than one specimen, seeing in his mind's eye many spots where such may be tellingly introduced; a few hints, therefore, on this subject may be acceptable to our readers.

The Willows are very readily propagated by cuttings; indeed, pieces cut 6 to 10 feet long and 6 inches in circumference, and sharpened by three clean cuts with a hatchet, may be dropped into holes made by a crowbar along the margin of a pond or stream, trod firm, and left to grow; such will form capital stocks on which to graft the Weeping Willow (*Salix babylonica*), or its somewhat hardier form, *S. Solomon*; while the extremely elegant weeping variety of *S. viminalis*, called in nurseries the American Weeping Willow, may be put on this stock; either of these do on the common Willow (*S. amygdalina*). The kind known as the Kilmarnock, however, prefers the stock, called in the Weald of Kent and Sussex the "Sally," no doubt a corruption of its Latin name "Salix." Foresters call it the Plum-leaved Willow, and large numbers are planted in wet woods in Kent and Sussex to grow Hop-poles; for now the "creosoting" system is adopted, Willow and Poplar poles last almost as long as those cut from Ash, or even Chestnut-stools.

Poplar rods, too, if cut from the clean, straight branches of the Black Italian Poplar (*Populus aladescica*), may be used exactly as the Willows to form convenient stocks, and on these can be put scions of Belle's Silver-leaved Lombardy Poplar, or Van Geert's Golden form of *Populus canadensis*, both of which form useful trees for planting in some situations, where a marked contrast is desirable. Then we have two weeping forms that make excellent lawn trees, especially in moist situations, viz., the Weeping Aspen, *P. tremula pendula*, and the Greek Weeping Poplar, with its small but deeply-cut leaves, both do well on the black Italian variety, or on the Aspen.

The Maples are best budded, but the false Planes (*Sycmores*) exhibit one or two startling deviations from the type, and should be grafted, such as King Leopold's Sycamore, with tricolor foliage, resembling in its young state a zonal Pelargonium of the Mrs. Pollock class; the other being a somewhat erect-growing tree, having dark green foliage, the underside of which is of a deep bluish-purple colour, giving it a most striking appearance on a windy day. Some fine trees I once saw at Baron Rothschild's struck me as particularly handsome. These were planted in close contrast to some fine variegated *Negundos* (*A. Negundo foliis variegatis*), than which there is, perhaps, no more useful or striking tree. Some of these planted among Purple Beech and the *Prunus Pissardi* (Purple Plum) were most attractive and effective in the landscape.

Everyone admires the Horse-Chestnut when it is exhibiting its wealth of white blossoms; indeed, Loudouers often make a pilgrimage to Bushey Park to see the Chestnut avenue there. Nurserymen have improved (?) this, by selecting a double variation from seed, while from North America we get a yellow and red form, the latter called in nurseries the Scarlet

Horse-Chestnut. These, as well as the Parias, may be budded on the common stock, but the one alone worth attention is that called "californica" (*P. macrostachya*) in nurseries; this makes but a bush or low tree, and flowers in June and July with an elegant loose spike of creamy-white flowers.

The Beech is one of the difficult trees to graft, but by following the method here indicated the careful operator is sure to succeed. The stock is the common white Beech, the usual practice being to graft these close to the ground, and then to earth up over the pug or wax like a Potato ridge, the reason for this being that the bark is very thin and apt to dry and curl, the moist earth preventing this. The selection of the scion, however, is the main difficulty.

growth, but the kind known as the Nettle-leaved Weeping is by a long way the most lovely, and should have a place on every lawn. The centre rises straight up, and the laterals droop in unmatched elegance around it, giving one the idea of a pale green fountain, while the bole is nut-brown, banded by pure ivory-white, adding greatly to the beauty of this lovely tree.

The False-Acacias, too, should be grafted low in the same way as the Beech, but may be budded at standard height if desired, the stock being the common Acacia (*Robinia pseudo-Acacia*). The round-headed Acacias, *A. inermis*, at one time exclusively seen in continental parks and road margins, had better be budded or grafted standard high

the celebrated John Waterer, of Rhododendron fame, has long pendulous racemes of flowers which have the merit of grateful fragrance. The so-called golden-leaved kind sent out by Mr. R. Smith, of Worcester, is desirable only in its early foliage, as later in the year the distinct golden hue leaves its foliage, which then assume a sickly appearance, and soon turn brown and drop. The distinct *Cytisus* received into our gardens from the Balkan Mountains, known as *Shipkaensis*, having large white flowers, would be grand worked on low stems of *Laburnum*; while *Cytisus scoparius* var. *Andreanus*, alluded to in my early articles, would, with care, graft on *Laburnum*, as I have had the pretty white Portugal Broom do well on this stock. The *Caragana*, however

FIG. 112.—GROUP OF CALADIUMS AT THE TEMPLE SHOW.  
(See Report, p. 650, in our last issue.)

When cutting these from your purple or copper Beech, look carefully along the two-year-old shoots, and you will see in places a series of fine rings indented in the bark, as though formed by a thread wound round it tightly. Cut your tongue through these peculiar marks, which I have not yet been able to account for, and you may count upon successful work [They are the scars left after the fall of the bud-scales. Ed.]; but if this advice is disregarded, you will court failure. The scions are then encouraged to make strong growth, the laterals stopped back to one or two buds, but left to thicken the bole, and this cut back at the desired height will form a good head. Being rarely strong enough to support itself, a good stout stake should be put to it till it can stand alone.

The Birch should be grafted in the same way, though marching is the best plan, and will be taken in the next paper. Few ornamental trees can compete with the common Birch in light elegance of

on free young stems of Pseudo-Acacia, while hispida, the Rose Acacia, is better grafted low down. The wood of this is so brittle that it should be fastened to a good stout stake while growing, as any attempt to straighten it when hardened will snap or split the shoot. This kind produces the largest and most showy racemes of flowers, which are bright rose, and is thus worthy of culture. There are many fine Continental kinds, for there the Acacia is a favourite tree, Decaisne's and Besson's being perhaps the two finest and most distinct.

In vivid contrast to these, we have the favourite *Laburnums*, by no means easy subjects to graft; but by choosing clean young stems of the English or upright growing variety, and putting on the scions when the leaf-buds begin to expand, using stout scions, one may succeed. One of the most elegant is *Alsingeri*, this has large foliage, and very long racemes of flowers, often 15 to 18 inches in length. Another named after

though near relatives, do not live on it long, the best stock for them being the tree *Caragana* (*C. arborescens*).

I believe I was the first operator to graft *Cotoneasters*. This genus makes very pretty small trees, grafted low on the *Thora* (*Crataegus*), but I had some seeds of *Cotoneaster frigidula* from the Cambridge Botanic Gardens which is by far a better stock, and this is now common in shrubberies, where it forms a loose spreading tree, flowering in May, and producing bunches of small coral-red berries in the autumn. The seeds, cleaned by rubbing the berries in sand, and sown in deep propagating-pans, will vegetate the next summer. When these get mature or ripe, pot them singly, or line out in the garden, when they will soon make nice clean straight stocks for *Cotoneaster* in any of its many varieties. The most useful and showy, however, is *Hookeri*, sometimes called *C. Simonsi*. This is of free, diffuse

upright habit, flowering very freely, and producing its fine coral-red, almost scarlet berries, which, if the birds permit, remain on the branches till the spring. Either grafted low, or about 3 feet from the soil, this forms an extremely pretty ornamental tree for the conservatory, the bright berries being very appreciable in the winter, or at Christmas. Either of the recent kinds—*C. microphylla*, *thymifolia*, &c., grafted thus, make neat and pretty weeping trees for shrubbery decoration.

The "Japonica," as it is popularly called (*Cydonia* (*Pyrus*) *japonica*), and usually seen trained on walls and fences, where it exhibits its brilliant blossoms to perfection, may be worked as a standard on the Thorn or Quince, the latter being preferable, as on it it makes a good large head, flowering and fruiting very freely. *C. umbilicata* and *C. Maulei superba* are the two most desirable, the latter, in addition to its brilliant flowers, giving in late autumn plenty of its golden-yellow, red-flushed fruits, which may be used like Quinces to flavour Apple-tarts, or to make preserve or marmalade, but being somewhat strong-flavoured, are best mixed with the fruits of the ordinary Quince. *Erperieno*.

(To be continued.)

## FLORISTS' FLOWERS.

### HIPPEASTRUMS.

WHEN the plants pass out of bloom is the time they require most attention. Both the flowering bulbs and the seedlings then require to be kept growing in a warm temperature; above all, they must be kept clean from mealy-bug, thrips, and red-spider. The mealy-bug clusters around the crown of the bulb, close to the surface of the ground, and will even burrow under the ground. They also attack the base of the leaves, causing them to decay long before they would do so naturally. Any bulbs so injured that they lose their leaves thus prematurely, are not likely to flower the following season. When fewer than 90 per cent. of full-grown *Hippeastrum* bulbs produce flower-scapes annually, it is most likely due to the premature destruction of the leaves during the previous season, or to improper culture. Under good treatment the disposition of every bulb is to flower. Red-spider and thrips will sometimes injure the leaves, but they seldom do much injury if a suitable temperature exists in the house, and proper culture is given them. I would particularly draw the attention of young gardeners to the importance of attending to the plants at the correct moment. It is now a busy season in most gardens, and I well know how difficult it is to keep all the work up to date, but the effort should always be made. However much the work may be in arrears it has still to be done, and if work that ought to be done this week be left a week or two longer, it will probably take a longer time to do it. These remarks apply with special force to rapid growing plants like the *Hippeastrum*. One of the most essential points in their culture is to see that they are encouraged to make plenty of roots, and this is effected by plunging the pots quite beneath the tan. It is astonishing how the roots grow in moist tan a year old, of which about half has become reduced to fine mould. They will penetrate every part of the bed, and they seem to derive a great deal of nutriment from it. The entire bed should be well watered once a week, and this will be sufficient to keep the plants in vigorous growth. If they receive any serious check during the present month, this may cause many of them to make a second growth after midsummer, which is undesirable. Maintain the first-formed leaves in vigorous health, so that they increase in size and substance until the end of the season, and treated thus a second lot of leaves is not likely. The seed is now ripening, and as soon as it is ready to sow, prepare a bed over a mild bottom-heat, and sow the seed thinly in flower-pots or pans. The young plants soon appear above-ground, and when 2 inches high, they ought to be pricked-out, a dozen of them in a 6-inch flower-pot. They will grow freely up to the end of the season, and indeed all through the winter. The leaves remain green upon seedling plants the second winter as well as the first. I have kept the seed until the second year, but it did not vegetate.

At present, the minimum temperature of the house should be from 69° to 65°, and in such bright days

as we now have, shading is necessary. The plants must be kept in this temperature and a comparatively moist atmosphere until July.

### THE AURICULA.

Show, fancy, and alpine types, now require considerable attention, green-fly working great injury; also the woolly aphid (*Trama auriculae*), which frightened growers some years ago. This last can easily be kept down, and does not seem to injure the plants much, but green-fly takes the outer leaves off, and cripples such as remain.

I find fumigation with tobacco is the best remedy. The present is the best time in which to re-pot the plants. I am now attending to the collections in these gardens, and will re-pot all of them excepting such as are seed-producers. Seedlings should be potted when they need it, and thus brought into good flowering condition, being put into the flowering-pots by the month of September. It is also a good practice to plant some of them in boxes, if space be limited, at 4 inches asunder, and the plants will make a fine show in this way in the spring. I have had some in boxes in flower for eight weeks. The Alpine Auriculas may be planted out-of-doors, and in that position they flower freely, a border not too much exposed to the sun being best suited to their needs; on the other hand, they should not be put under trees. A good deep, rather heavy soil suits them best, and it is not desirable that they suffer for want of water at the roots. When dry weather sets in, afford one good watering, and mulch the surface of the bed with rotten manure. I ought to add that the best potting-soil consists of four parts good loam, one part decayed manure, and one part leaf-mould; sand of a coarse quality is usually added to keep the compost open.

### CARNATIONS AND PICOTEES

In pots, and planted out, all require attention. The pot-plants are all now in an open position out-of-doors, and sticks have been placed to them; but where they are too much crowded with flower-buds these ought to be thinned out. The exhibitors usually allow only about three flowers to each stem. One amateur who exhibited very large blooms allowed one only to be on a plant; this was not safe, as the "crown" bloom is generally open about one week before the side blooms, and fades by so many days before them. The side blooms will win at a flower-show when the crown blooms have passed away. In hot weather, syringe the plants freely to refresh them, and clear off dust and green-fly from the grass. Tie the flower-stems to neat sticks before they fall over, and allow no weeds to grow in the pots. Seedlings should be pricked out in beds at 3 or 4 inches asunder, and as soon as they are large enough, they should be planted out 14 or 15 inches asunder where they are to flower.

### POLYANTHUSES

Will have passed out of bloom, and as the plant forms roots very freely, it is good practice to divide those that are taken up from the beds, and plant out the divisions in a shady, moist place. In dry, shallow, light soils it is of no use to plant hard Polyantuses, as the leaves get eaten up with red-spider and green-fly. Seedlings grow more freely than named varieties, and will make a good display of bloom where named varieties will scarcely exist. They do best if the soil is deeply worked, and some rich manure placed about 1 foot below the surface, to attract the roots downwards. I have found them succeed well in soil where the Cowslip grows naturally.

### TULIPS.

These have now passed out of bloom, and but little attention will be needed now beyond removing the shading, hoeing the ground, and breaking off seed-pods. The bulbs may be lifted and dried in an airy loft as soon as the stems can be bent without breaking, a test the old florists always adopted.

### THE RANUNCULUSES

Must be watered with a rose-water-pot between the rows, or they will soon show signs of distress in hot, dry weather. The plants should have a thoroughly good watering, and unless the season is very dry, the earliest-planted tubers will not need it often. Tubers of *Ranunculus* planted so late as April, or even May, for succession-bloom, would have to pass through a drier period, and would need more water. The old-fashioned florists' *Ranunculuses*, with perfectly-formed globular flowers, do not seem to have the vigour they used to have. The fact is, they require renewal from seed, and unless this is done, they will in time pass out of cultivation. We must go back to

the papers written by the late Mr. Cary Tysoe, of Wallingford, for the best information. He flowered thousands of seedlings annually, and surpassed everybody, even professional gardeners. He states in a paper, published just sixty years ago, that "four or five varieties in a hundred seedlings are equal to the best-named sorts in cultivation; and it is certain that those who grow only the old sorts cannot successfully compete with those who grow seedlings." In an unfavourable season when the old roots did not bloom more than ten in a hundred, the seedling-beds presented masses of bloom. Those who have *Ranunculuses* in bloom, or coming into bloom, should save seed. Sow in the autumn. The plants will flower the next year. *Jas. Douglas*.

## FOREIGN CORRESPONDENCE.

### BOGOTA.

A FRAUD IN THE ORCHID TRADE.—Amongst all the Orchids imported to England, probably the most popular as well as the most extensively cultivated is *Odontoglossum crispum*. Every year many thousands of this plant are imported from Colombia for the English market. It is no secret that the most famous type is that of Pachó, and this is becoming more and more scarce, and consequently more expensive to collect in its native habitat. When it is mentioned that the Pachó type is the most prized, it should be stated that inferior types are procurable in great abundance other than in the Pachó region; thus, the inferior types abound at a distance of two or three days' from the Pachó centre. In England there are some expert *O. crispum* growers who can, as a rule, distinguish the Pachó forms from the worthless forms; but even experts are sometimes at a loss to distinguish the legitimate Pachó forms when they are exposed in the market for sale as imported, i.e., plants with bulbs devoid of leaves. Where experts are sometimes puzzled, the ordinary purchaser at sale-rooms is, of course, easily duped. Forms or types of the plant are thus frequently bought that are not worth growing. Not only worthless forms are in this way acquired, but thousands of plants come to England under the pseudonym of *O. crispum*, that turn out after being cultivated for a lengthened time, with attendant expense, not even inferior forms of *O. crispum*, but *O. Lindleyanum*, &c., plants that are subsequently consigned to the rubbish-heap.

This year a new departure in the *O. crispum* trade has sprung up; scores of thousands are being exported from Colombia. The vast majority of the plants thus obtained come from regions whence only the worst known types of *O. crispum* come—amongst them a large intermixture of *O. Lindleyanum*, &c. But this is not all. These despised types of *O. crispum*, &c., are conveyed several days' journey on mules' back to Pachó, in order to pack them there, and to label each case with the name of "Pachó!" *Criterion*.

### GLASGOW NOTES.

THOUGH this district has long been noted for its well-cultivated gardens, there never was at any time more interest taken in, and encouragement given, to gardening than at present. Though horticultural exhibitions are not given the support from the public which they deserve, there are indications that a more encouraging state of matters has commenced.

I made a special visit lately to see the principal features in some of the parks and gardens which have attracted much public attention of late, and was glad to note that nothing has been over-rated. Accompanied by the able and courteous park-superintendent, Mr. Whitton, I made an early visit to the spacious

### QUEEN'S PARK

(designed by the late Sir Joseph Paxton), and which has an imposing appearance from the long street which leads to it from the town. A wide avenue, well-furnished with trees on each side, forms a noble entrance to this beautifully-embellished park, from which many beautiful views can be enjoyed. Many

gentlemen's seats are prominent on the rich landscape, eastward, southward, and westward. Looking northward, from an elevation reached by steps, a view is commanded over the great city, and a great contrast is presented to the hills and dales on the opposite side. We passed hurriedly through the gardenesque portions, where gay Tulips with other flowers and dwarf shrubs clothe the beds until the summer bedders can with safety be planted in them. The chief object of our visit was to see the large block of glass-houses which has been erected during the past year. Elegance in form and usefulness for plant culture have been points which have received careful consideration.

A large span-roofed house filled with Camellias, Palms, Phormiums, Dracaenas, Azaleas, Tree-Ferns, and other plants form the centre; and from this a number of lower span-roofed houses run onward on

MAXWELL PARK,

which is comparatively new, well laid out, there being no crowding, and there is plenty of space for promenading on grass and walks. Numerous beds filled with flowers, Tulips, &c., were very gay, and had been arranged tastefully in beds and borders. Bustard was doing extra well among the crimson-flowered varieties, and Yellow Prince was very showy and effective.

Leaving this garden-park and others till later, time being limited, we hurried on to accomplish what we had further in view. It is well known that in this part of Glasgow many species of Orchids are cultivated with great success. Dendrobiums at

REDLANDS

have long been a speciality in the hands of Mr. Russell. We were too late this year to see the

among the best of the specimen plants. We passed some fine plants of *Dendrobium Wardianum* and *Lycaste aronatica*. A house full of *Anthuriums* was a special attraction; and two dozen *Cutleya labata* in good health are much valued—it is probable the number will be increased. Passing through other structures in which were *Dendrobiums* and *Palms* in quantity, we went on westward after expressing our gratitude to Mr. Russell for his courtesy and communicativeness. I was accompanied all the while by a keen Orchid specialist. Not being satiated with Orchids, we went to—

ROSEMOUNT,

where a good collection of Orchids is to be seen in the highest state of cultivation. The collection is in the charge of the enthusiastic gardener, known far and near as "Mr. Davie Wilson," but, unfortunately,

FIG. 113.—SANDER'S GROUP OF FOLIAGE PLANTS AT THE TEMPLE SHOW.  
(See Report in our last issue, p. 651.)

each side at right angles, all of which can be easily entered from the main building. These smaller but most useful houses contained Orchids, Palms, and stove and greenhouse plants. Many plants are forced during winter for decorative purposes. Cinerarias from seed, *Primula obconica*, and some hundreds of double white *Primulas*, were worthy of note. *Deutzias*, *Azaleas* in variety, *Spiraeas*, and *Rhododendrons*, contributed largely to the floral display.

Leaving these, we proceeded to inspect the additions now being made to the park—roads are being formed, excavations made, levelling, turfing is being done, and altogether a deal of labour is employed. When the new additions are completed, the public will have every facility for enjoyment which green-sward and foliage of trees afford. In this addition every good feature of the old ground will be carefully conserved, and made fit for the public enjoyment, where all may pass without let or hindrance. We passed from this to the—

flowers, but the plants were robust and healthy. Orchids in flower included *Odontoglossum gloriosum*, *O. crispum*, *O. c. guttatum*, and *O. triumphans*. There were also some fine forms of *O. Rossi majus*. We passed through many other plant structures, where Orchids are used with excellent effect among foliage plants. When entering the elegant conservatory attached to the house, in a small division was a beautiful arrangement of choice *Gloxinias*, interspersed with Ferns, *Caladiums*, and *Dendrobium Devonianum*. Passing into the large building, there are some wire stands, circular in form, about 9 feet across, which revolve. They are placed at regular distances, and are beautifully arranged with flowering and foliage plants. There is no stiffness, and plenty of room is left to walk around among the plants. The sides are lined with tables containing choice flowering plants. Some *Dicksonias* growing up into a lofty dome were in extra vigour. *Rhododendron* var. *Monarch* was extra fine, and *R. Veitchii* was

our friend was away from home. When entering this well-managed place, an immense bank of *Rhododendrons* is passed, and notwithstanding that the atmosphere is always charged with smoke from the city, the *Rhododendrons* were as clean, healthy, and full of flower-buds as anything we saw in *Argyleshire* a few days afterwards. In the houses first-rate culture of plants seemed to defy the power of smoke or any other pests so common in all such localities. Ascending flights of steps we passed into the beautiful glass structure, a house full of remarkably fine-foliaged plants was entered; then a long ornate house, filled with a choice collection of flowering plants, from which Orchids were not absent. The roof of the house was clothed with *Lapagerias*, in fine condition. Another stove full of choice plants was admired, in which were splendidly-grown *Cyanophyllums*, *Anthuriums*, and grand specimens of *Eucharis*.

The *Odontoglossum*-house contains a collection of

plants than which it would be difficult to find a finer or healthier. This was, perhaps, the strongest proof of our good friend Davie's ability. *O. crispum*, numbers of which were flowering, included many large flowers which provoked the admiration of my friend the specialist. He noted one spike of large flowers which he believed could hardly be equalled in the north. In fine condition also were *O. Halli*, *O. Jenkinsianum*, *O. triumphans*, *O. Pescatorei*, *O. Andersonianum*, the last-named being a plant with two extra fine spikes, and nearly fifty blooms on each! *Lycaste Skinneri* and *Oncidium serratum* were among the most thriving specimens. Leaving this fine house of plants, we passed through another structure full of fine-foliage plants, with many specimens of *Dendrobium nobile* in vigorous health. Before leaving, we had a peep at the vineries. The foliage was large, leathery, of deep green colour, and there were abundant crops for mid-season and late supplies. Mr. Wilson exhibits Orchids largely at the Edinburgh and Glasgow shows. *M. Temple, Carron, N.B.*

## BOOK NOTICE.

### UNITED STATES NATIONAL HERBARIUM.

The United States Department of Agriculture, Division of Botany, issued on April 1, the final part of a preliminary revision of the North American species of Cactaceae. This work, which is from the able pen of Prof. John M. Coulter, is the completion of the North American Cactaceae, which was begun by the preliminary revision of *Cactus*, *Anhalonium*, and *Lophophora*, published as contributions from the United States National Herbarium, Vol. III., No. 2 (issued June, 1894). As the work progressed it became more and more evident that the revision could consist only of the systematic collection of present knowledge, based upon the study of the very inadequate material accessible in herbaria and gardens. It seemed, however, proper to contribute to the knowledge of the group such facts as had come to light in the course of several years of study, especially as an excellent opportunity had been given to examine Dr. Engelmann's types and unpublished notes. The work includes all known forms within the United States, but only such Mexican and West Indian forms as could be personally examined.

## THE WEEK'S WORK.

### FRUITS UNDER GLASS.

By W. Pore, Gardener, Highclere Castle, Newbury.

**THE PINERY.**—Those plants which were placed in their fruiting-pots in March, and are rapidly growing, should not be too heavily syringed overhead, nor have more water afforded them at the root than suffices to keep the soil moderately moist, as any excess in these directions, or too high a temperature, with much humidity, will cause soft growth. On the other hand, an insufficient quantity of water will cause the leaves to become brown, and the plants stunted. The syringe should be used on sunny afternoons, and then lightly, the surface of the beds between the pots being moistened so as to afford a genial atmosphere. On fine, warm days, artificial heat should be sparingly used by day, but applied sufficiently early in the afternoon to prevent the temperature falling below 70° after closing the house for the night. To provide ripe fruit in the autumn months, some of the plants should be induced to throw up their fruits during the next few weeks, keeping them somewhat on the dry side, and fully exposed to sunshine for a week or two, and in a bottom-heat of 90°. As soon as fruit shows, water copiously if the soil is in the least degree dry. Winter-fruiters should also be kept rather dry, as well as cooler, preparatory to starting them in July. Plants whose fruits are rapidly swelling, will require a plentiful supply of water at the roots, more being required at this season than earlier. At this stage the Pine-stove should be closed by 2.30 or 3 o'clock, the plants below the leaves and the bed being lightly syringed. Commence to ventilate in the morning when the thermometer indicates 80°, and close at 85° or 90° with sun-heat. Weak guano-water or other stimulant may be afforded as required, withholding these when the fruits show colour. The bottom-heat should keep steady at

85°; do not let more suckers remain on a plant than one or two. Suckers of early plants of the Queco may be potted as soon as they get well-rooted, and if given a good shift, and liberally treated, these will come into fruit in good time next year.

**MIDSEASON AND LATE VINERIES.**—Vines with bunches now growing fast should have the crop finally reduced, and the berries thinned for the last time. Grapes for winter consumption must be more freely thinned than others. All Vine-borders should be examined from time to time, and when water is really needed, it should be afforded freely, mulching afterwards being not neglected. Ventilate freely all vineries in calm warm weather, leaving a small amount on all night, increasing it early in the morning. The bunches on late Vines will now require thinning without delay. The berries of short-stalked varieties, such as Black Alicante, if neglected for a very short time, become closely wedged together, and very difficult to thin without doing more or less injury to them with the scissors. Look closely to the stopping and rubbing-off the lateral growths, never allowing the production of these to go on for a length of time, and then giving a severe thinning.

### THE KITCHEN GARDEN.

By C. HERRIN, Gardener, Droghare, Maidenhead.

**TURNIPS.**—Notwithstanding the prevailing drought, early Turnips have done fairly well here; but those now bulbing need copious waterings occasionally. Continue to make sowings at intervals of about a fortnight, choosing cool spots for the sowings, such as a border at the back of a south wall, or on the shady side of a plantation of tall trees. The sowing last made should be afforded a good watering after the thinning of the plants is done, if rain do not fall. The old Snowball and Red Globe represent two good varieties for present sowing.

**HERBS.**—The present is a suitable time to make-up beds of Spear and Peppermint, and form new beds. The simplest and easiest method of increasing these useful herbs is by cuttings, made of the tops, taken off 5 to 6 inches in length. The lower leaves should be stripped off, and the cutting inserted firmly in the soil of the open border, where they strike readily. The rows of cuttings should be about 8 inches apart, and in the row they should stand 4 or 5 inches apart. A good watering should be afforded the ground after the planting, using a water-can with a rather fine rose, and a few branches stuck in the bed for affording shade for a few days, providing the weather be very sunny, otherwise, if the cuttings have an occasional sprinkling, they soon strike root, and grow away freely. Spearmint struck after this method affords a nice supply of tops for use late in the summer. Seeds of Thyme may still be sown, and the plants from the earlier sowings should be transplanted 6 inches or so apart each way. Sweet and bush Basils and Sweet Marjoram should be ready to plant out on to the herb border at similar distances apart as those given above, and other sowings made in the open, if necessary. Tarragon roots transplanted some time since should be supplied with water during the dry weather, until they begin to grow freely, and if a slight mulch can be given this will be advantageous. Pennyroyal is a sweet herb much used in some establishments. The best situation for this is on a cool border with a north aspect, where, if it be carefully planted, it requires little more attention than to replant it once a year in the spring months, and affording it water once or twice, if dry, until re-established. Seeds of Chervil should be sown occasionally, to ensure a constant supply, as in dry weather this plant soon runs to flower, producing then but few leaves; and it should be grown in a shady place. The earlier sowings of Parsley should be thinned, leaving the plants 4 inches apart at the least; the stronger thinnings may be used to fill up spaces under walls and odd corners.

**LEEKs.**—Early-sown Leeks should now be ready for planting out into trenches thrown out to a depth of 6 inches or rather more, and 18 inches from centre to centre, and having some good rotten dung forked into the bottom of each. Before planting, make the surface-soil fine with the fork or rake. If the Leeks are standing in boxes, lift them carefully with a trowel, so as to bring away a ball of soil with the roots, and make the soil firm about the roots when planting. The plants may stand 1 foot apart. Water should be freely supplied to Leeks in dry weather. This kind of treatment will produce large blanched roots for exhibition or special home use. For all ordinary purposes, and providing the land be in good

condition, good Leeks may be grown by simply drawing out drills about 5 inches in depth and 15 inches apart, and planting in these without further preparation of the soil, at 1 foot apart in the rows.

**GENERAL WORK** will now consist of thinning the Parsnip, Carrot, Salsafy, and Onion crop; and unless large roots are required, it is a mistake to thin too much, as for ordinary use medium-sized roots, bulbs, &c., are both more useful and economical than big ones. It is advisable to go over the beds twice rather than to remove all surplus plants at one time. Parsnips may stand at 8 inches apart, Carrots at 6, and Onions at 4 inches apart, but where large size is necessary, these distances may be doubled. Recently-planted Celery should be kept moist at the root always. Prick off the plants from later sowings into cold frames, and avoid retaining the seedlings in the seed-beds to get drawn and weak, which no after management of the plants can turn into good stout heads.

### PLANTS UNDER GLASS.

By Jno. McINTYRE, Gardener, Woodside, Darlington.

**BOUVDIARIS.**—Those gardeners who require large quantities of choice flowers for cutting in the autumn and winter seasons, will do wisely to give every attention to the Bouvardias during the next few months. The planting-out method may be strongly recommended to those who may have spent hot-beds at their service, these being excellent for planting-out upon in frames. If cuttings were struck in accordance with directions, the little plants being nicely established in 3-inch flower-pots will be fit either for being planted in the spent hot-bed frames, or repotted. If the frames that will be made use of are those that were employed for growing the earliest crop of Potatoes, a part of the soil therein remaining should be thrown out, and some leaf-mould and loam of a light nature in equal parts added, so as to make a bed 8 inches deep, the height from the lights being 1½ feet. Make the bed smooth and firm before proceeding to plant out. Set out the plants 9 inches square, afford the bed a thorough watering, close the frame, and shade and keep closed for a few days, by which time the plants will have taken to the soil and begun to grow. Now is the time to pinch all of the points of the shoots, continuing to pinch as the new shoots acquire a length of 2 or 3 inches. In this way nice bushy plants are made. The season of flowering may also be regulated by pinching, as eight weeks will elapse from the time of the last pinching till the plant flowers. If Bouvardias are grown in flower-pots these should be plunged to the rims in garden-frames filled with half-decayed leaf-mould.

**HINTS ON WORK IN GENERAL.**—Numerous jobs now require attention, as the repotting of Balsams, Cockscombs, Celosias, Browallias, and other summer-flowering plants of the greenhouse. The early sowings of *Primula sinensis* and *P. obconica*, will now require to be pricked off into shallow pans or boxes filled with a light kind of compost. Seeds of *Cineraria* may be sown to bloom early, and of *Humea elegans* for raising specimens for use next spring.

**COLEUS.**—These plants, although not so much grown in gardens as was formerly the case, are of some value as decorative subjects where much furnishing has to be done, coming in, as they do, as substitutes for more valuable plants, and whose loss is of small account. Cuttings of Coleus may be struck in quantity in thumb-pots filled with finely-sifted leaf-mould and silver-sand, one cutting in each pot; when rooted they should be shifted into 5-inch pots, a size sufficiently large to furnish suitably-sized plants for vases, &c., although a larger size will be required for greenhouse specimens. Specimen *Clerodendrons* now coming to perfection should be taken from the stove to a slightly cooler and dryer house; a conservatory, if not too much ventilated, will suit these plants. The overhead syringing of the plants should be discontinued, but farm-yard liquid-manure may still be afforded. The shoots of trained specimens will require regulating, the flowering shoots being so disposed that the best effects are obtained, which, if done forthwith, will give the flowers time to assume a less constrained appearance.

**DIPLODENIAS**, if secured to strings stretched to the rafters of warm pits in the manner recommended in a former calendar, should be showing for flower, and any which are intended for flowering early—say, the middle of the month of June to the end of July—may be taken from the strings and trained to balloon frames of wire. When wooden stakes are used, the job is less difficult, the shoot and the twine

being simply taken together and fastened around the framework of stakes, which should be neatly made and painted green. The growing shoots of Dipladenias are easily injured, and it is a good method to have the pot with the balloon or stakes so placed that each shoot, as it is taken from the rafters, can be readily fastened in its proper place. Late-flowering plants may remain on the strings for some time longer, but always allowing a period of three or four weeks to elapse after detaching them, for the leaves and flowers to assume their natural appearance. Sheep's-dung makes a good stimulant if used in a liquid state for Dipladenias, and may be afforded the plants at short intervals during the season. As soon as the plants are well in flower, remove them to a house having a temperature of 60° to 65°, and which is carefully ventilated.

### THE HARDY FRUIT GARDEN.

By G. WOODGATE, Gardener, Rolleston Hall, Burton-on-Trent.

**WALL-TREES OF ALL KINDS.**—The various operations of nailing or tying-in of all growth left for extension, should be followed up to prevent their being bruised or broken by the wind; also the stopping of shoots, to form fruiting-spurs; and whilst this kind of work is in progress, a sharp look-out should be kept for caterpillars, which are very numerous this season on fruit and other trees.

**PYRAMID, CORDON, AND BUSH** Plums and Cherries are much infested with aphides, and a few Plum trees are getting infested with red-spider. To destroy the latter, heavy syringings with clean water must be applied before the insects make much headway. For the destruction of aphids, an insecticide is required, which should be applied to the trees in the evening, at 100° of warmth, using a sprayer, and being careful to wet the underside of the leaves. The points of the leading shoots, if badly infested with the insects, may be dipped in the insecticide, the leaves being gently rubbed between the finger and thumb. All lateral growths may have their points pinched back to within six leaves of their base, which will have the effect of relieving the trees of numerous individuals. These and other prunings should be burned forthwith. The pyramidal, bush, and espalier Apples and Pears should be frequently examined, and the dead petals and other rubbish which congregate in the clusters of young fruit removed, these forming hiding-places for caterpillars, difficult to clear them out of.

**GOOSEBERRIES.**—The larvæ of the Gooseberry saw-fly have just made their appearance on the bushes, and where plantations are extensive and hand-picking costly, fresh-slaked lime should be well dusted among the branches, early in the morning, whilst wet with dew. The gardener should wear a glove on one hand, as the lower branches must be held up, so that the lime may be brought into contact with the caterpillars, which, if thoroughly done, is a very efficacious remedy, and has no bad effect on the foliage or fruit; at the same time it does away with any prejudice still remaining in the minds of some against eating the fruit, if such a poisonous insecticide as Hellebore is used. If red-spider should show itself, give the bushes two or three good syringings of clear lime-water, made by mixing 1 lb. of quicklime in 3 gallons of water, letting it stand for twenty-four hours, pouring off the water and leaving the sediment. The dry weather gave gardeners a good chance of killing weeds growing in the fruit quarters, but the suckers from the roots of the Plums and Pears have given much trouble here. A few of these may be pulled up, but mostly they have too good a hold to be removed in that way, and it is best to clear away the soil down to the roots, and cut off the suckers with a sharp knife, as then there is no injury done to the roots.

**NETS** to be used in protecting the ripe fruit of Strawberries, Cherries, &c., should be overhauled, and got in readiness for use, and if more netting is required it should be obtained from the dealers.

### THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

**DENDROBIUM PHALÆNOPSIS.**—Without doubt this is one of the most beautiful of all Dendrobiums in cultivation, and it is decidedly a great acquisition, especially as a cut flower. Its habit the plant does not vary, but the colours of the flowers do so considerably, being pure white in some instances, and rich crimson-purple in others. They remain in perfection on the plants for a very long time, and also when cut. For the past six months the plant has been entirely at rest, and if the proper kind of attention has been afforded

during that time they will be now about to start into growth. At first the growths are thin and weak, but they gain strength rapidly and swell out. When the new shoots are a few inches high a number of young roots push out from their bases, and just before these are visible, the plants, if they require it, should be repotted; or if not in need of repotting, the old material should be picked out from between the roots, and fresh compost afforded. If greater root-space be really necessary, the operation of repotting should be done with but very little root disturbance. The plants will thrive in pots, wooden baskets, or shallow pans, only it is important that these should be small in proportion to the size of the plant that will go into it. New baskets of teak are preferable to old ones, and the pots and pans should be quite clean. Plenty of drainage should be afforded, and over this place a very thin layer of fibry peat and sphagnum-moss, with a few thick crocks intermixed. The compost should be packed firmly around the plants, as the roots delight to ramble amongst the hard, porous material. The crocks being hard do not retain moisture for any great length of time, which is in every way conducive to the health of the plants. After repotting, place in the hottest and sunniest position available, and, until the new roots are re-established, only a small quantity of water is necessary; but afterwards, and till growth is complete, it may be afforded copiously. A very thin shade is required even at the hottest part of the day, and then only for two or three hours. Experience has shown that plants grown under plenty of sun-light surpass those afforded ordinary stove treatment in vigour and rapidity of growth. Such plants also produce stronger flower spikes, richer-coloured flowers, and they pass through their long resting season in a satisfactory manner. While the plants are exposed to strong sunshine, air should be allowed to circulate freely around them; but when shading becomes necessary, the amount of ventilation must be slightly reduced; and at about 2.30 p.m., when the shading is removed, it should be increased, and so remain for about half an hour. With the sun shining full on the plants, the house should be closed and well damped down, and the plants slightly dewed overhead with tepid rain-water. The temperature of the house will quickly rise to 100° or higher with advantage to this plant. Other species of Dendrobium which luxuriate under this kind of treatment are *D. superbie*, *D. bigibbum*, *D. stratiotes*, *D. lineale*, *D. streblceras*, *D. secundum*, *D. taurinum*, *D. Bensonie*, *D. macroplyllum Veitchianum*, and *D. atroviolaceum*. At present, the new *D. speciosissimum* appears to enjoy this kind of treatment also, the young growths, although they advance but slowly, being strong and healthy. Such tall-growing Dendrobiums as *D. Dalhousieanum*, *D. moschatum*, *D. clavatum*, *D. calceolus*, and *D. fimbriatum*, also require fresh material to root in at this season.

### THE FLOWER GARDEN.

By HEDLEY WARREN, Gardener, Aston Clinton, Tring.

**BEDDING-OUT.**—Although much of this kind of work has been done, the planting-out of the more tender kinds should not be proceeded with for a few days. It is unsafe to put out *Alternantheras*, *Coleus*, and similar plants, until the first or second week in June, the recent sudden change in the weather showing that, except in very sheltered positions, only those plants capable of withstanding 3° or 4° of frost should be placed in such positions where protection cannot easily be afforded. Arches may be planted with such climbing plants as *Tropæolums*, *Lophospermum scandens*, *Ipomœas*, *Maurandya Barclayana*, &c. Rustic baskets, vases, and similar objects may also be planted with similar plants, or those of a trailing habit, Ivy-leaved *Pelargonium* being especially useful. Beds occupied by standard Rose trees may be planted with dwarf-growing plants, such as Harrison's Musk, *Violas*, *Verbenas*, to form a pleasing groundwork to the Roses. Only surface-rooting plants should be used for this purpose. Any odd borders or beds may be made gay by planting them with African and other *Mari-golds*, *Phlox Drummondii*, *Petunias*, and such-like plants that have been raised from seed. Sheltered nooks and corners may be planted with groups of *Eucalyptus*, *Acacias*, *Solanums*, and similar plants. They afford a pleasing change in the general appearance of the shrubberies.

**BOCCONIA CORDATA** is an excellent herbaceous perennial for planting by the side of a stream, or in any moist position, and if used in conjunction with the *Giant Fennels* the effect is more telling; the flower-spikes of the former being shown with greater effect by contrast with the Fern-like foliage of the latter.

**HERBACEOUS BORDERS.**—Keep these free from weeds, and maintain general neatness and order. *Rudbeckias* should receive a surface-dressing of wood-ashes and soot, to prevent attacks from slugs, which are frequently the cause of considerable annoyance.

**LONICERA SEMPERVIRENS** is just now coming into flower; the blossoms are of a bright red colour, and are very freely produced, contrasting well with the bright green foliage. The plant appears to thrive best if planted at the foot of a wall rather than on an arch or isolated trellis work, unless the position is quite sheltered from rough winds.

**DAHLIAS** may shortly be planted out. Give the plants ample room, so that they may not become drawn. Secure each plant to a stout stake, and in tying allow space for the stem to expand. Mulch the ground afterwards with short manure, and afford a good supply of water.

**GENERAL WORK.**—There being much work to be done in all departments at the present time, considerable judgment is necessary in arranging its performance. The weeding of paths and shrubberies, the removal of seed-pods and dead flowers from *Rhododendrons* and hardy *Azaleas*, the mowing of grass, clipping of verges, and much other work will keep the men in this department busy for some time.

### THE APIARY.

By EXPERT.

**SUPERING.**—By this time all section crates and shallow frames should be ready to put on the hives, as this often prevents swarming by allowing the bees more space, even if they do not commence working in them for a few days. Where bees are kept in skeps and likely to swarm, it is a good plan to slightly raise the skep about 1 inch, by means of two small pieces of wood placed a little distance from the entrance; by this means they get more air, and so cool the temperature of the hive—of course, this alludes to cases where honey is preferred to swarms. There are several methods of working skeps, namely, by small straw supers, bell-glasses, or in crates containing from twelve to eighteen sections. Where bell-glasses are used, I would recommend the use of a piece of wood to stand the glass on, with a fair-sized hole in the centre, from 6 inches or more, according to the size of bell, this prevents the combs falling down in very hot weather; it is also a good plan to fix the board on the skep firmly by means of a little dough, this prevents any draught, which bees greatly object to. The easiest way of fixing combs for starters is to heat the glass with warm water, the foundation will then adhere to the glass by means of a little gentle rubbing.

In some cases in supering bar-framed hives, it is necessary where the stock is very strong, to add an extra frame or two; these should be filled with full sheets of worker foundation, as when only half-sheets are used, the bees are apt to build drone-comb. It is also a good plan to wire the frames, which prevent any damage in manipulation. In putting on supers, great care should be taken to clear off all pieces of comb and rubbish from the top of the frames, so as to allow the crate to fit down evenly; strips of carpet about 2 inches wide should be placed round the crate on the top of the frames, so as to prevent the bees from escaping, or any draught, and cover up warmly with two or three pieces of clean carpet. In all cases use the best foundation for filling sections. Zinc dividers will be found better than wood or glass, as the bees do not propolis metal so firmly. A simple way of fixing foundation in sections is to slightly wet the handle of a knife, and rub the comb sharply on to the middle of the section, and gently pull straight; this will be found better than using glue, particularly for show purposes, as no dark mark can be seen, as is the case with glue. It must not be forgotten that a good smoker, and a cloth soaked with carbolic acid (Calvert's No. 5), one part of acid to three of water, should always be at hand; when not in use the cloth may be kept in a small air-tight tin, which will keep it damp and ready for use for several weeks.

**YUCCA GLORIOSA IN BLOOM.**—A splendid specimen of the *Yucca gloriosa* is at present in full bloom in the garden of Mr. WILLIAM HESLOP, Howe o' Buchan, near Peterhead, N.B. It is nearly twenty years since Mr. HESLOP entered into possession of this house and garden, but until the present time he has never seen the plant in flower. The flowers are very abundant, and the specimen is regarded by experts as being a remarkably fine one.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR JUNE.

THURSDAY, JUNE 4	Linnean Soc. Meet.; Anniversary Meeting at 8 P.M.
FRIDAY, JUNE 5	Roy. Bot. Soc. Lecture
SATURDAY, JUNE 6	I. of W. Hort. Assoc. Soc. Franc. d'Hort. de Londres Meet.
SUNDAY, JUNE 7	Roy. Hort. and Agr. Soc. of Ghent Show.
TUESDAY, JUNE 9	Roy. Hort. Soc. Coms.
WEDNESDAY, JUNE 10	Roy. Bot. Soc. Floral Fête. Geneva Ex. temporary Sh (14 days).
FRIDAY, JUNE 12	Roy. Bot. Soc. Lecture.
SATURDAY, JUNE 13	Roy. Bot. Soc. Meet.
SUNDAY, JUNE 14	Brussels Orchidiféerie Meet.
WEDNESDAY, JUNE 17	York Floral and Hort. Fête (3 days)
THURSDAY, JUNE 18	Linnean Soc. Colchester Rose and Hort. Show.
FRIDAY, JUNE 19	Roy. Bot. Soc. Lecture.
TUESDAY, JUNE 23	Roy. Hort. Soc. Coms.

THURSDAY, JUNE 25	Hereford and West of England Rose and Hort. Show. People's Palace Hort. Sh. (3 days).
FRIDAY, JUNE 26	Roy. Bot. Soc. Lecture.
SATURDAY, JUNE 27	Canterbury Rose and Hort. Windsor Rose and Hort. Royal Bot. Soc. Meet.

SALE FOR THE ENSUING WEEK.

FRIDAY, JUNE 5	Orchids from Messrs. F. Sauter & Co., at Protheroe & Morris' Rooms.
----------------	---

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK—59°.

MR. L. H. BAILEY contributes a paper with this title to the *American Naturalist* (Jan. 1, 1896, p. 17). "We are told," he writes, "that variation which is useful to the species is congenital or born of the union—or the amalgamation in varying degrees—of parents which are unlike each other. From the variations which thus arise, "natural selection" [as it is asserted by Neo-Darwinians], chooses those which fit the conditions of life and destroys the remainder. That is, individuals are born unlike and unequal, and adaptation to environment is wholly the result of subsequent selection."

It is the object of the paper to show that the variations in plants are largely, if not entirely, due to the action of the environment during the life of the plant, and if the environment be constant for generations, then the new characteristics thus acquired "after birth," may become fixed and hereditary.

Commencing with germination, most plants "start practically equal, but they soon become widely unlike. . . . It is the effort to adapt itself to circumstances which gives rise to the variation." Now we all know that no two individuals are absolutely alike, but slight individual differences will not account for "the wide divergences which may occur between the members of any brood before they reach maturity." It is important to bear this in

mind, for it is on such differences that Mr. WALLACE originally based his theory of the origin of species by means of natural selection.\*

That author, however, has lately drawn a distinction "between specific and non-specific or developmental characters."† The latter are those innumerable individual differences which occur between any offspring even from the same parent, because plants cannot grow with mathematical exactness, like crystals, which, whatever their size, have always their facets inclined at the same angle in the same mineral. It is only when some new forces are brought to play upon a plant—as by a new environment, especially that of an artificial soil and treatment, that variations in structure appear of a more pronounced character than the usual individual and inconstant fluctuations.

"The whole structure of agriculture is built upon this fact. All the value of tillage, fertilising, and pruning lies in the modification which the plant is made to undergo." In every crop of any kind it is seen that though the plants started equal, they remain equal or become unequal according to the nature of the soil, &c., for "we know that variations in plants are very largely due to diverse conditions which arise after birth."

"All these variations in land and other physical conditions are present in varying degrees in wild nature. . . . Dandelions in the hollows, on the hillocks, in the roadside gravel, in the garden—they are all different Dandelions, and we know that any one would have become the other if it had grown where the other does."

Besides the inorganic physical conditions of the environment, there is also the mutual effects due to the struggle for existence among the plants themselves, i.e., as seen in the necessary adaptations to be made to meet and overcome this struggle. Though many weaklings die, for many more seeds germinate than ever come to maturity, an interesting experiment of Mr. BAILEY's showed how many there were that survived on a limited area. "I staked off an area of 20 inches square," he writes, "in a rich and weedy bit of land. When the first observations were made on July 10, the little plot had a population of 82 plants belonging to 10 species. Each plant was ambitious to fill the entire space, and yet it must compete with 81 other equally-ambitious individuals. Yet a month later, the number of plants had increased to 86; and late in September, when some of the plants had completed their growth, and had died, there was still a population of 66. The censuses of the three dates were as follows:—

	July 10	Aug. 13.	Sept. 25.
Crab-grass ( <i>Panicum sanguinale</i> )	22	20	15
Black Medick ( <i>Medicago lupulina</i> )	16	17	15
Parslane	14	15	12
White Clover	12	11	8
Red Clover	9	11	8
Red-root ( <i>Amarantus retroflexus</i> )	4	4	4
Ragweed ( <i>Ambrosia artemisiifolia</i> )	2	2	2
Pigeon-grass ( <i>Setaria glauca</i> )	1	2	3
Pigweed ( <i>Chenopodium album</i> )	1	1	0
Shepherd's Purse	1	1	1
	82	86	66

As the number had increased by August, the question arises, if they had all grown bigger,

how could so many as eighty-six plants been maintained? In two ways: first, the plants were of widely different species of unlike habits, so that one plant could grow in a place where its neighbours could not. . . . The second and chief reason for the maintenance of this dense population was the fact that each plant grew to a different shape and stature, and each one acquired a different longevity; that is, they had varied, because they had to vary in order to live."

The value of this experiment, as far as the origin of species is concerned, of course, lies in the test whether any characteristics resulting from this struggle were "impressed upon the seeds for resurrection in following years," as Mr. BAILEY expresses it. To a large extent, we expect it will not be so, for Mr. BAILEY seems to refer to the manner and habit of growth, and does not describe any structural changes upon which varieties and species are founded. Thus many plants growing in a soft moist soil and crowded, grow erect; but in a dry, hot, barren, and rocky soil, they assume at once a prostrate habit. Or again, in a poor soil, plants are dwarfed as on the chalk downs, but elsewhere, the same species will grow tall, as, e.g., the stem of *Cnicus acaulis* will; so that survival and growth under the above-described struggle would seem to be more a matter of innate vigour, coupled with some temporary adaptation of habit to the circumstances under which each plant found itself to be. Still, the struggle for existence is one element of an environment, and there is no *a priori* reason why structural adaptations to it, if they occur, should not become relatively fixed, as in any other kind of environment. This requires testing, and we are glad to see that Mr. BAILEY proposes so doing.

Mr. BAILEY then tried an experiment with precisely similar cuttings of *Petunias*, growing them in pots, but treating them with various nourishing salts, &c.; the results were as follows:—

Check.	Phosphate of Potash.	Sulphate of Potash.	Phosphate of Soda.	Phosphate of Ammonia.
67 days	68 days	99 days	65 days	104 days
295 blooms	235 blooms	18 blooms	275 blooms	33 blooms

"Here is a variation of thirty-nine days in the time of first bloom, and of an average of fifteen flowers per plant, in asexual plants from the same stock, all of which started equal, and which were grown in perfectly uniform conditions, save the one element of food. But these or similar variations in cuttings are the commonest experiences of gardeners. Whilst some philosophers are contending that all variation comes through the sexual union, the gardener has proof day by day that it is not so. . . . Very many of our best domestic plants are selections from plants which are always grown from cuttings or other asexual parts." The author mentions a case of a new variety of Blackberry raised from a sucker of the "Snyder." In a previous paper he described the Apples of the United States, which varied according to the country they grew, though not raised from pips.\*

The evidence, in fact, is abundant and accumulative that "plants which start to all appearances perfectly equal, may be greatly modified by the conditions in which they grow, and the seedlings of these plants may show these new features in few or many generations;"

\* "The Plant Individual in the Light of Evolution" Address before the Biological Society of Washington, Jan. 12, 1895 (*Science*, new series, vol. i, p. 281. March 15, 1895).

\* On *Natural Selection*, p. 266

STRAFFAN HOUSE, CO. KILDARE, IRELAND. FROM THE BANKS OF THE RIVER LIFFEY.

the necessary condition being that the external conditions must be constant till the characters become relatively fixed. Such is the origin of new varieties in cultivation, and ultimately of new species in Nature. It is the method recognised by DARWIN, but thought by him to be exceptional and not a law of Nature, viz., by the direct or definite action of the environment through the responsiveness of protoplasm in the organism itself. DARWIN'S words are as follows:—"By the term definite action, I mean an action of such a nature that, when many individuals of the same variety are exposed during several generations to any change in their physical conditions of life, all, or nearly all, the individuals are modified in the same manner. A new sub-variety would thus be produced without the aid of natural selection."

**FLOWERS BY POST.**—Almost every family that takes an interest in flowers, and the decoration of their rooms, knows that most beautiful boxes of flowers are sent from the south of France and from Italy to private houses in this country, and it is acknowledged that cut flowers may be sent by post, and there is a special rate in Italy and France for sending them to this country, to Russia, and to Germany, and it is duly entered in the conditions of the Postal Union. Having occasion to send some hothouse flowers to Belgium, I applied to the local post-office, asking them under what rate they were to go, and they informed me that there was no rate and that there were no instructions in the *Postal Guide*. I then thought it would be as well to clear up the whole matter with the General Post Office, and I wrote to them on the 14th inst., asking them if they would inform me upon this subject, and I enclose you herewith a copy of their reply. Surely such a commercial country as England, which is now largely developing the cultivation of flowers under glass, especially Orchids, ought to be in a position to send flowers to the Continent at a similar rate to that at which they can be sent from abroad to this country. At the present time the only chance we have is to send them as "samples." The question is, "Is this a satisfactory arrangement?" T. W. Christy.

COPY.

General Post Office, London.—May 21st, 1896.

In reply to your letter of the 14th instant, I beg leave to inform you that it is the custom in France and in Italy, where there are large industries in cut flowers, and where there are found to be great difficulties in discriminating between flowers sent as samples by florists and flowers of trifling value sent by private individuals to their friends, to treat small boxes of flowers as samples of merchandise, and send them to England and other countries of the Postal Union at the rate of postage applicable to samples. In this country consignments of flowers are not regarded as samples, and are only transmissible by the letter post or the parcel post.

I am, Sir, your obedient servant,  
(Signed) H. BUXTON FORMAN.

**A RECORD NUMBER.**—We printed and circulated last week in the ordinary manner a larger number of copies than ever before during our fifty-five years' existence, not even excepting the special occasions when we have given supplements, as of *Windsor, Hatfield, or large coloured plates of as Roses and Lilies*. During the last few years the circulation, as the publisher tells us, has doubled.

**THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—We may remind our readers that the annual dinner in aid of the funds of this, the gardeners' own Institution, will be held at the Whitehall Rooms, Hôtel Métropole, this day (Saturday), at 6.30 for 7 P.M. The Earl of LATOON will preside. We earnestly hope that the Institution will largely benefit, and the fellow-feeling among the members of the craft be strengthened.

**ROYAL BOTANIC GARDENS, MANCHESTER.**—The flowering Thorns just now are quite a sight

along the promenades. Most of the trees are on clean stems 8 feet or more, and then bush out into considerable bulk. The vividness of the colours of Paul's Double Crimson, and the profusion of the umbels, might be equalled, but could not be excelled, and that, too, under the influence of town smoke. The scarlet Horse-Chestnuts are equally full of bloom, and present a profusion of Hyacinth-like spikes that one does not often see. The trees are all so shapely that they keep the eye lingering in admiration. The Gueldres Roses ranged along the side of the show-house are only plants about 6 or 7 feet high, but they are simply loaded with their bell-like trusses of greyish-white flowers. The Schizanthus, grown in pots in the houses, are one feast of lilac and white beauty, made up of pinnatus, papilionaceous, and Grahami. These are grand and cheap plants for furnishing, requiring only cool treatment to get them to perfection.

**THE DROUGHT.**—We are not the only sufferers. A Massachusetts correspondent writes:—"No rain for weeks, and the country is in a deplorable condition. The New England hay crop is ruined, and I do not remember to have seen pastures dried up before in May. Seeds do not germinate, and flowers are poor, and last but a short time. Altogether, for those who love gardens, the outlook is deplorable."

**PAULOWNIA IMPERIALIS AT VENTNOR.**—During the past fortnight the numerous visitors to this charming resort in the Isle of Wight have had the opportunity of witnessing the exceedingly pretty flowers of the Paulownia. Most of the trees we saw were growing in the small public park at the commencement of the Undercliff, but other and isolated specimens were noted in several of the gardens in the same vicinity. On most of the trees about a fourth of the shoots appeared to have been killed back a short distance during the winter, or the dead wood had not been removed last season. As the plant produces its blooms terminally from the old wood, any severe injury to the ends of the shoots during winter prevents them flowering, but the shoots not so affected were blooming well and quite strongly.

**MESSRS. SUTTON & SONS' NEW PEAS.**—Readers will be interested to learn that the fine exhibit of Messrs. SUTTON'S new Peas which was a striking feature of the Temple Show, was, by special consent, forwarded to Windsor Castle and placed in the Grand Entrance Hall, where it was inspected by Her Majesty the QUEEN on Friday, the 22nd inst. Messrs. SUTTON have received a letter from the Master of the Household conveying the thanks of the Queen for the beautiful Peas and Tomatos kindly sent for Her Majesty's acceptance.

**THE SACRED TREE OF KAM-BAM.**—Dr. DYER writes:—"I gave in *Nature* for March 5 last, a full account of this tree. The study of authentic material leaves no doubt in my mind that it is *Syringa villosa*, a Chinese species. I conclude my note with the remark:—"the phenomenon is not consistent with itself at different times. This confirms the opinion of M. BLANC, that it is an elaborate fraud." W. T. THISELTON-DYER, *Kew*."

**SCOTTISH HORTICULTURAL ASSOCIATION.**—On Saturday afternoon, May 23, the members of the association, to the number of fifty, drove to Hopetoun House, where, on their arrival, they were met by Mr. SMITH, the Earl of HOPETOUN'S head gardener, who conducted them through the well-kept gardens, deer-park, and pinetum.

**NATIONAL TRESPASS PREVENTION AGENCY.**—A Society has been formed with the following special objects:—The keeping in stock and prompt supply of suitable public and private notices for the use of patrons of the agency; the warning of local offenders, owners of trespassing stock, poultry, &c., direct from the central office; and the promotion of combined action throughout country districts to put down trespass and damage to property. The highly satisfactory results that have followed local

efforts in the Bristol district for the suppression of trespass and damage to property, &c., have led to the establishment of this agency, which gentlemen thoroughly conversant with the efforts alluded to, believe will prove of great service to owners of property, occupiers of land, and market-gardeners throughout the kingdom, and become in time a powerful influence against law-breakers. It has been clearly demonstrated that public notices, when displayed in the name of a strong combination of owners of property, have far more effect than when put up by an ordinary individual, and where the former course is adopted, an individual can prosecute as the member of such a combination rather than upon his personal responsibility. When neighbours exhibit similar notices upon adjoining lands, it is at once clearly understood by the lawless that combined and resolute opposition may be expected. When such notices are kept freshly put up, and not always in the same place, they are much more effectual than old, dingy, moss-covered notices that have appeared in the same position for years past. Private notices, warning offenders in the name of a strong combination, have also great weight. Such, at any rate, is the experience of a very successful growing local society at Bristol, with over 500 members, whose secretary will carry on this agency upon his own responsibility. A member of the society alluded to sold £55 worth of Mushrooms off his open pasture-fields in 1895, though living near a large city. Before having the protection of the society he had to employ men day and night to protect his crop. Police officials of high standing report a large decrease of petty larcenies, &c., in the district over which the notices of the society are displayed. At the last annual meeting, Colonel T. W. CHESTER MASTER said:—"He was exceedingly glad to hear the satisfactory report that had been read, and to find that they were an increasing body." Prevention being far better than cure, a bold and united front is the truest policy against law-breakers, especially in the neighbourhood of large populations. With the object of promptly supplying owners of property in any part of the country, stout line-backed notices, of suitable size (for nailing to trees, or pasting upon boards, &c.) have been prepared, and will represent the Agency in whatever part of the kingdom they are displayed. Mr. JAMES HUNT, 12, Hampton Park, Bristol, is the manager.

**PARIS.**—Just as the Temple Show closed, the corresponding exhibition of the National Horticultural Society of France began. The show was held in the Tuileries Gardens. Messrs. Lindens' Orchids, Moser's Azaleas and Rhododendrons, and those from Croux et fils, Vilmorin's Pelargoniums and Calceolarias, Vallerand's Gloxinias, and Leveque's Roses, were among the principal exhibits.

**ROSE SHOW FIXTURES IN 1896.**—The following additional fixtures have been kindly sent us by Mr. EDWARD MAWLEY:—June 24 (Wednesday), Richmond (Surrey); 27 (Saturday), Southsea; July 1 (Wednesday), Farnham; 14 (Tuesday), Westminster (Royal Horticultural Society); 16 (Thursday), Halifax; 29 (Wednesday), Chesterfield, this last has been changed from August 5 to July 29.

**OAK-APPLE DAY.**—In a reasonable article on "Royal and Notable Oaks," which appears in *The English Illustrated Magazine* for June, Mr. GEORGE CLINCH traces the history of many ancient customs associated with the Oak-tree. Of "Royal Oak Day" itself he says:—"The first anniversary appointed by Parliament to be observed as a day of general thanksgiving for the restoration of Charles II. was on May 29, 1665, and Oak boughs and Oak twigs were used to decorate the streets as well as for personal ornamentation upon every annual recurrence of the festival. WILLIAM PENDRILL, who had assisted in hiding CHARLES II. among the Boscobel Oaks, having died in London in 1671, was buried in the churchyard of St. Giles-in-the-Fields, and it became a regular custom for many years to decorate his tomb with Oak-boughs on this day. In fact, the wearing of Oak-leaves and Oak-apples, and the frequent use of

\* *Animals and Plants under Domestication*, vol. ii., p. 272.

Oak-boughs in the decoration of the village street, grew throughout the country with a spontaneity and a rapidity which suggest that there was a general and deep-seated prejudice in favour of the Oak. It is more than probable that 'Restoration Day,' or 'Royal Oak Day,' became to some extent confounded in the public mind with those festivities associated with May Day, which were so particularly marked by the use of greenery and floral decorations. One or two of the Royal Oak Day customs in various parts of the country are remarkably suggestive of May Day customs."

**ROYAL BOTANIC SOCIETY.**—The movement in favour of having musical promenades in the gardens on Saturdays, to be open to the public on payment of 1s., has entered on a new phase, as a guarantee fund is being formed to cover the expense of engaging a first-class band to play on six consecutive Saturday afternoons, commencing June 13 next. This proposal will be considered at the next Fellows' meeting to be held on the 30th inst. The meeting will be held in the society's gardens on Saturday, the 30th inst., at 3.45 P.M. *J. S. Rubinstein, Hon. Auditor of the Royal Botanic Society, 56, West Cromwell Road, S.W.*

**FERULA ASAFETIDA.**—The flowering of *Ferula Asafetida*, Linn., is rare enough to make it worth while putting on record. At the present time, a plant in the economic garden of Heer MARTEN BUIJSMAN, at Middelburg, Netherlands, is now in that interesting state. The name of the owner will be known to the readers of the *Gardeners' Chronicle* as the skilful preparer of dried officinal plants, and specimens for special study, under the title of *Herbarium Analyticum*, and this occurrence will doubtless be utilised for the preparation of specimens which are not easily made in the native habitat of the plant. The first record of this species flowering in this country will be found in our columns for 1859, June 4, p. 487, from plants which were raised from seeds sent home by Dr. FALCONER, and reared at the Edinburgh Botanic Garden. See also *Gardeners' Chronicle*, Nov. 23, 1878, p. 662.

"HERE LIES OLIVER GOLDSMITH: BORN 10TH NOV. 1728; DIED 4TH APRIL, 1774."—Some of the visitors to the Temple Show may have found their way to a court on the north side of the Temple Church, and there they may have seen the tomb of the author of the ever-memorable *Vicar of Wakefield*. Year by year, as we visit the show, we pay a little pilgrimage to this little Campo-Santo, hoping against hope to find that the authorities have placed a rail around the tomb, and saved it from the desecrations enacted by playful but heedless youth. Nothing is done to protect the tomb; and the effigy of the scholarly physician MEAD, close by, is also gradually becoming obliterated. This is a matter for the College of Physicians to see to; and the demands in each case are relatively so slight, that ere another Temple Show comes round we may hope—rather than expect—to see the necessary measures of protection carried out.

**SWISS NATIONAL HORTICULTURAL EXHIBITION.**—According to information kindly forwarded us by M. MICHELI, the ornamental gardens of the Parc des Beaux-Arts are entirely separated from the horticultural exhibition itself. This is concentrated in the Parc d'Agriculture, on the left bank of the Arve, while the arrangement of the Plaine de Plain Palais has been undertaken by a private individual. This is M. ALLEMAND, the well-known landscape gardener, who has included in his general plan of operations the planting of tall and moderate-sized trees, and the formation of numerous clumps of shrubs, masses of flowers, &c. The arrangements on the left bank of the Arve are made so as to allow of a continuous succession of exhibits during the continuance of the exhibition. The framework or basis of the exhibition is formed by the *concours permanents*, which comprise fruit trees, ornamental trees and shrubs, Conifers, perennials, &c. There is, further, once a month, to be a temporary exhibition open for a week, and devoted to the flowers, fruits, and vegetables of each season. The

greenhouses will be occupied during the whole of the exhibition, some by groups, constantly renewed and re-arranged, others by temporary collections. The two large tents are to be devoted, one to monthly congresses and cut flowers, the other to vegetables and market-garden produce. Roses will form an important feature of the exhibition. There is also to be a splendid collection, from M. FROEBEL of Zurich, of ornamental deciduous trees and shrubs, Conifers, climbing plants, perennials, &c. M. THIBAUT (of Chêne, Geneva) also sends a fine selection of Conifers, shrubs with deciduous and evergreen foliage, climbing plants, and others, nearly all the classes of open-air plants being represented. M. BOCCARD, of Geneva, has undertaken the embellishment of a portion of the grounds with large Conifers and other trees, such as are rarely seen at exhibitions. This is but a faint outline of the arrangements made, on an extensive scale, for the Geneva Exhibition. To describe the work in detail would take much space.

**PROFESSOR WILLIAM SAUNDERS**, Director of the Experimental Farm in Ottawa, has received the degree of Doctor of Laws from Queen's University for work done in advancing agricultural science, and for work of a similar character in connection with the Royal Society of Canada.

**CHESTER HORTICULTURAL SHOW AND FETE.**—A free horticultural conference in connection with the above will be held at Chester on the eve of the show (August 4), under the presidency of his Grace the Duke of WESTMINSTER. Papers relative to "The History of the Royal Horticultural Society of England," "Garden Craft," and the "Literature of Horticulture," will be read by Sir TREVOR LAWRENCE, the Dean of ROCHESTER, and F. W. BURBIDGE, Esq., respectively.

## STRAFFAN HOUSE GARDENS, CO. KILDARE, IRELAND.

[SEE SUPPLEMENTARY ILLUSTRATION.]

THE Kildare country is one of the richest and most fertile districts near Dublin; indeed, for its hunting and agricultural and pastoral character it might almost be called the Leicestershire of Ireland. St. Patrick is identified with the Boyne Valley and Royal Tara, in the fertile county of Meath, while the Lady-Saint of Ireland, St. Brigid, was more closely connected with beautiful Kildare. Here she had her oratory and school or college under a giant Oak tree, and many are the local traditions and songs still extant as to her enlightened and beneficent ministry. The main river is the Liffey, which springs up at the base of the Kippure mountain, and steals away from its source as a mere rivulet through a lovely glen of the same name. The spring itself is near the ancient church of Kilbride, or church of St. Brigid, who founded many religious houses here in the fifth century. The old cathedral at Kildare, recently restored, contains the burial-place of the Earls of Kildare, and at least one of the Dukes (Robert) of Leinster is buried here. In a small chapel the sacred fire was kept perpetually burning until extinguished by Henry de Londres in 1220, and when rekindled soon afterwards, it remained constantly tended and alight until the Reformation. There is also a round tower adjacent to the church, and the river Liffey, after being swelled to a considerable size, passes through co. Dublin, and through the city itself, and empties its waters into Dublin Bay.

Straffan House stands close to the river, and the lower lawn and the island adjacent are not unfrequently overflowed when it breaks its boundary banks after snow or heavy rains. The place has long been in the possession and occupation of the Bartons, and is now renowned for its fertile farms and well-managed gardens. Our illustration, from an original photograph specially made for us by Mr. John McLeish, shows the house as it stands up boldly on a raised plateau above the banks of the stream, and surrounded by fine trees, amongst which Beech, Lime, and Oaks predominate.

The extensive gardens are naturally beautiful, and are kept up for use as well as for their aesthetic charm, and the present owners, Major H. M. Barton and the Hon. Mrs. Barton, have long and persistently enriched the various collections, and welcomed real garden lovers within their gates. Apart from the usual garden plants here met with under the best of cultural conditions, there are also many that possess a personal interest, as having been collected abroad, and introduced by the owners themselves. It is to the Hon. Mrs. Barton, for example, that we are indebted for the original living bulbs of *Narcissus Bernardi*, from the slopes near Gavarnie; *Asplenium fontanum*, and a very distinct white *Hepatica*, also from the Pyrenees; the giant *Orchis latifolia*, from Kilmarnock; the dark, rich form of *Anemone Pulsatilla (montanum)*, from Royat, and others, are only a few of the personal introductions to Straffan.

Straffan, like all other good gardens, is instructive, every day throughout the year. All things useful and beautiful in the way of plants are valued and grown. There are Orchids, stove and greenhouse plants, Ferns, Palms and Nephthes, bulbs and aquatics, and hardy flowers in abundance everywhere. There are two flower gardens, both more or less formal ones, that are a pleasure to see, spring, summer, or autumn, so varied are their contents, so rich and satisfying are their masses and groups of vivid colouring. Here a patch of some old tuberous-rooted *Begonia*, or of the soft yellow *Calceolaria amplexicaulis*, *Fuchsias* and tufted *Violas*, *Heliotropes*, *Verbenas*, *Mignonette* or *Pelargonium*, selected for its general fitness or for its unique shade of colour, and not because it is rare or costly; and yet rare plants are here, and the best plants of *Begonia Veitchii*, *B. boliviana* and *B. rosadora*, and *B. Pearcei* (types), I ever saw were here in this garden.

Growing along with *Masdevallias* and *Odontoglossums* in a cool house, you find a pot of *Narcissus*, *Cyclamens* with twenty or more blooms; the rosy-salmon plumes of *Carex scaposa* are seen side by side with a pot of seedlings of *Ramondia pyrenaica*, or *Sophronites grandiflora*, with its fifteen or twenty scarlet butterfly-looking blooms. *Vanda Sanderiana* has flowered here, so also *Eulophiella Elisabethæ*, and the great *Oncidium macranthum*, with its quaint lip, shaped like a fox's head. Here is *Erpetium reniformis*, the "New Holland Violet," beside the coral-berried *Nertera*; there the "Lady Tulip" of Clusius, or the "Peacock Iris," is spreading its petals out in the sun; *Disa grandiflora* in various forms is as happy here as I ever saw it anywhere; so also the rose-crimson and white forms of *Lapagerias*, which last year were covered with ripe fruits in September, owing probably to the visit of the hawk-moths, or other insects on nectar bent.

*Anthurium Veitchii* here bears leaves about 6 feet in length by 15 inches or more in width, looking for all the world like Zulu shields of crinkled and crumpled hide; and a plant of the South African Blood-flower (*Hemantus Katherineæ*) bore nine of its gigantic orange-red-flowered spikes amongst its undulated apple-green leaves, and was photographed in all its glory.

But apart altogether from things rare or common, hardy or tender, brilliant or sombre, there is at Straffan a welcome extended to all sweet and fragrant flowers. You see the common white *Jasmine* spurred-in like an old Grape-vine on the walls, the result being plenty of long flowery-tipped shoots for cutting. In depth of winter *Chimonanthus* expands its odorous wax-like bells, and there are whole frames full of the dear old scented *Pelargoniums* and *Diosmas*, and *Myrtles*, of our great grandmother's days.

Then in the wintry days there are the crimson Dogwood, and Golden and Cardinal Willows, and Silver Birch, and yellow Reeds beside the swollen river, all aglow with rich and subtle colouring. Even on a dull winter's day there is a suffusion of warm colour suggestive of sunshine. One of the sights to see at Straffan, however, early in the new year is the Snowdrops spreading in dense masses beneath the red-twigged Lime trees as we shall illustrate on another occasion.

Daffodils, as a rule, grow very luxuriantly, at

Straffan, as also does *Iris reticulata* in a bed specially prepared for its reception with peat, sand, and cocoanut fibre. A small bed of this *Iris* bore no less than 600 flowers at the same time during the past season. All sorts of herbaceous plants, and most shrubs and flowering trees do well in the deep, rich, holding soil at Straffan. Roses are especially beautiful, of many kinds. *Rosa polyantha* forms cascades of its tiny white flowers, as also do many other of the old climbing or pillar roses, and all the best of the hybrid Sweet Briars have recently been added to the Rose garden.

There is much to see and admire at all times in the greenhouses and fruit-gardens, and at few other places in Ireland is fruit better grown, or more refined in quality and flavour than it is here. Lying low near the river, spring frosts are very severe, but, on the whole, fruit of all kinds does well. Apples, Pears, Plums, Cherries, Strawberries, Peaches, and Grapes are alike of excellent quality.

One may safely say of Straffan, that the gardens are of a thoroughly well-managed, all-round character; and having known the place for nearly twenty years, I may say that I rarely if ever visit a place with more genuine interest and instruction. *F. W. B.*

## HOME CORRESPONDENCE.

**RHUBARB.**—The accompanying particulars of a stick and leaf of Rhubarb which we pulled here yesterday may be of interest. Width of leaf, 45 inches; length of stalk, 18 inches; circumference of base of same,  $8\frac{1}{2}$  inches; round upper end,  $7\frac{1}{2}$  inches. The plant is one I have had for twelve years, and have had it now in four successive gardens, moving the plant with us. Its character is green stalk and flesh, with a very thin skin; and the leaf is heart-shaped. There is very little fibre in the stalk. The one gathered is the youngest but two on the plant, the two new ones being only slightly smaller. *Charles E. Powell.*

**EFFECTIVE AND TELLING FLOWER-BEDS.**—The following mixtures can be recommended. A bed may be thus planted:—1st row, dwarf Fuchsia, with purple corolla; 2nd row, standard Fuchsia, 3 feet high, Rose of Castille; 3rd row, standard do., 5 feet, dark corolla; 4th row, standard do., 7 feet, Lord Beaconsfield; centre Fuchsia, 9 feet, corymbiflora. Ground-work of the beds should be either Ivy-leaved Pelargoniums, Violas, or tuberous Begonias. The Fuchsias should not be massed very closely, but space allowed to admit of their being seen to advantage. Another bed may be planted with *Petunias* of a light striped kind, the shoots being pegged down; standard plants of *Coleus Verschaffeltii* dotted evenly over the bed, and an edging of *Viola Countess of Kintore*. A Begonia bed, to show the plants to perfection, should be raised in the centre and sloped off to the sides, flat beds of Begonias being not at all telling. Much may be done with Begonias for bedding purposes, but it requires some amount of skill to place them to advantage. A very effective pyramid 5 feet high may be made of *Tropæolum Mrs. Tredwell*; these pyramids placed in their proper places on lawns, or between flower-beds, relieve the flatness, and are very telling. *Edw. Bennett, Queen's Road, Egham.*

**THE TEMPLE SHOW.**—Your criticisms on the lack of novelty found in both the material and the arrangements of these shows are undeniably correct. Everyone realises that there is exceeding monotony, and this monotony doubtless largely accounts for the apparent listlessness which seems to characterise the visitors. Somehow, so far from having languid interest aroused by any speciality or novelty seizing their attention, the general desire seemed to be to get outside the tents and listen to the music. The council are of necessity hampered in their arrangements of the tents and exhibits by the conditions imposed upon them by the Benchers of the Temple, hence it seems difficult, if not impossible, for them to do more than they do at present. Still, that fact should not deter those enterprising exhibitors, who practically furnish the show, from striving to carve out some new methods of displaying their products. The general fault, of course with an eye to business, is endeavouring to show too many things, of making their groups of exhibits too bizarre, and in this

sort of arrangement failing to create any sort of sensation or effect that would "catch on" and command notice. The elimination of the element of competition doubtless also is promotive of lassitude; when competition exists everybody, as a rule, wants to see the winning collections. In the present case, with so much of sameness, interest is soon killed. Now that everyone is familiar with the form of the annual show, with the space usually at disposal, and place customarily allotted, is it too much to ask that, so far from leaving everything to chance as to what sort of a collection of stuff may be made up for the occasion, that rather some efforts be made at once to provide special exhibits that shall have the merit of being new, or novel, or attractive, or something out of the common, and thus make a mark, for which all attending the show would feel grateful? Whilst plants and cut flowers must ever in the month of May occupy the greatest prominence, I saw the other day how possible it was in some directions to show that fruit and vegetables may form attractive features. Mr. G. Bunyard's collection of Apples constituted for the time of year a wonderful feature; but they would have attracted much more attention had they been flanked with a collection of imported Apples, if but to show to the people what can be done at home in Apple production and storing as compared with what our colonies can send us. Vegetables were abundant and good, but covered too much ground in small quantities. With these, again, we want to be able to compare home produce with that sent us from warmer climates. In that respect, I am not sure whether Messrs. Sutton & Sons' wonderful collection of Peas in pots would not have attracted greater attention if forming one group, and had by their side examples of both home-grown outdoor Peas, and similar examples of the best imported also. A suggestion made to one of our best growers in relation to one fruit will, I hope, be taken up and acted upon with success. If that be so, then there will be presented a most striking feature another year that will certainly arrest attention. No doubt many other suggestions in the direction of improvement will be offered, but there can be no doubt carrying them out lies more with exhibitors than with the society. One small collection of vegetables, quite remote from all others, and in preparing our report of the show last week overlooked, was staged by Messrs. J. Carter & Co., of High Holborn. It was composed of Potatoes labelled First Crop, Telephone Peas, and Longsword Dwarf Beans in heaps, Duke of York Tomatoes, Syon Leeks, Victoria Spinach, and Earliest-of-All Cucumbers. The Potatoes were International Kidney, the Beans Canadian Wonder. *A. D.*

**IRIS.**—Can you tell me why my Irises have all gone the colour of the enclosed specimen? They were originally dark purple, but each year the number of dark flowers has become fewer, and this year I had only about a dozen dark flowers; they came out about a fortnight before the others, the later ones being all light-coloured. This year I had a large clump split up to see if it would make any difference, but it has not done so. Of the two spikes enclosed, the one with the two flowers is from an old clump; the single flower is from one of the transplanted. It is about six years since they were first put in the ground. They blossomed well for two years, and then began to change colour in one clump, and it has gradually spread to all in the garden. *A. M. Young.* [A case of reversion, more interesting to the physiologist than to the gardener. *ED.*]

**CAMPANULA REGINA.**—I was much interested in the editorial note (p. 648), on a plant to which the above name is given, apparently on the authority of *Nature*, though I have not seen the report in question. One thing, however, is clear. I believe somebody has made a synonym for a plant described only last year! It struck me from the context that it might be the *C. mirabilis* of Alboff, and on turning to his *Prodromus Floræ Colchiæ*, p. 158, t. 1, my suspicion was confirmed. Doubtless, the error arose through the author's observation: "*planta speciosissima floræ Abchasie regniæ.*" From looking at the plate and reading the description, one would hardly share either the author's enthusiasm as to its beauty, or his opinion as to its singularity. It is certainly a pretty plant, bearing a profusion of lilac flowers less than  $1\frac{1}{2}$  inch in diameter, and similar to those of *C. Mediana* in shape. *Campanula mirabilis* is apparently a biennial having a large tap-root, a rosette of spatulate radical leaves, and a dense, pyramidal growth above-ground

about 15 inches high. Mr. Alboff describes it as: "*Species magnifica mirabilis, radice crasso danci-formi, foliis rigidis pergameis circumcirca pellucidospinulosis, &c., irasignis.*" And he adds:—"Affinitates in flora orbis terrarum contemporanea omnino desunt in flora fossili inquirendæ." I must repeat that I see nothing indicating such remote affinities. The Central Asian genus, *Ostrowskya*, figured in the *Gardeners' Chronicle*, July, 1888, p. 65; and in the *Botanical Magazine* for the present month, is beyond comparison a remarkable plant. I may add that Mr. Alboff describes and figures in the same work a very singular and distinct new species of *Gentiana*, *G. paradoxa*, having narrow, verticillate leaves, and large terminal solitary flowers. *W. Botting Hemsley.*

**NARCISSUS WITH DOUBLE FLOWERS CHANGING THEM TO SINGLE ONES.**—Reading my *Gardeners' Chronicle* of to-day, I observe your enquiry on behalf of "Scrutator," and in reply beg to say I have known the Double White Narcissus, when grown in bulk out-of-doors, develop single flowers in lieu of double. This circumstance occurred last spring in my garden at Soudon, Isle of Wight, and I was very disappointed at the fact. *Thomas Langston.*

**THE BOLTING OF CABBAGES.**—Has the time of sowing seed of Cabbages any relation to the tendency to bolt, of which some writers complain? and does the methods of seed-saving influence in any way the bolting of Cabbages? were the two questions I put to Mr. Alfred Johnson, of Boston, recently. Not only is the Boston district famous for its breadths of Cabbages, but Mr. Johnson, as a large grower for seed for many years past, has had considerable experience of the plant. He said there did undoubtedly exist an old-fashioned practice of sowing Cabbage seeds at certain times, and in the case of Cabbages for market, the first sowing was made the first week in July, advantage being taken of rainy weather to do so; another sowing was made a week after, and then another at an interval of a week or ten days. He thought the modes of treating the plants for seed had more to do with the tendency to bolt than the time of sowing. The practice he adopted was to go over the fields of Cabbages as they hearted, and all the earliest that were true to the type were staked, and anything inferior in character pulled out. The heads of Cabbages are cut, and by October the stumps have put forth a few sprouts, three or five or so; then the marked stumps are lifted, replanted in trenches in a slanting position, with just the tips of the sprouts above the ground, and these grow, bloom, and bear seed. Seed so obtained very rarely produced bolters, but the practice adopted by some of sowing the seeds in drills, thinning-out the plants, and leaving the others to run to seed without hearing, does, in Mr. Johnson's opinion, lead to a tendency to bolt in the seedlings obtained from seed so saved. That the time at which the seeds are sown may operate to promote or prevent bolting, appears to have gained some substantiation from a trial in successive sowing made by Messrs. Hurst & Son, a few years ago. Seven sowings were made at an interval of a week, five in July, and two in August; an equal number of plants of each were planted out, and in the spring following it was found that the smallest percentage of bolters was in the sowings made about July 25, and August 2; the largest percentage in the two earliest sowings. *R. D.*

**POND WEED.**—I should feel greatly obliged if any of your readers, can give me any advice as to how to stop the growth of the common filmy green weed in a pool of water in my garden. The pool is about 28 feet long by 17 feet broad, and a fountain of spring water flows into it at the rate of at least 3000 gallons daily, so that the water is constantly changing. The pool is formed of concrete, but is covered at the bottom and sides with rough stones and rocks to hide the concrete, I lately had it emptied and all the stones, &c., washed with weed-killing solution, but in a fortnight's time there are again signs of the slimy green weed. The water comes in iron pipes from deep springs. I have planted Water Lilies in the pool, but, if necessary, could remove them. *A Constant Reader of the Gardeners' Chronicle.*

**PRIMULA SIEBOLDI IN THE REGENT'S PARK.**—Mr. Jordan is to be congratulated upon the success which has attended his employment of *Primula Sieboldi* as a bedding-plant in the Regent's Park. Planted on a raised narrow border, it has grown vigorously, and is now blooming abundantly. The species lends itself to this particular use; the foliage is strong and erect, the flower-stems stiff and upright, and the

flowers stout in substance, and well displayed. In these respects it presents a marked contrast to many of the seedlings obtained from it, as with but few exceptions the blossoms are much cupped and curled, and too thin in substance to be of any value for outdoor work. Thinness of petal is a prevailing fault with many of the newer varieties, and it has no doubt resulted in a great measure from the use of imperfect varieties as seed-bearers. It would be well if someone would take the best varieties in hand, and commence cross-fertilising again. Queen of Whites, Gem, pale mauve and rose; General Gordon, soft pink; lacinata, bright magenta-crimson; purpurea, purple; and Mauve Beauty, pale mauve, would be a good half-dozen to work upon, the type being also included. There is so much room for improvement, and such a need of bright deep colours, and especially of violet, and shades tending to blue, that it is to be hoped some enterprising florist will make a move in the direction indicated. For some reason, P. Sieboldi and its varieties have not received the attention they so well deserve; and it is to be feared that some of those who have attempted to cultivate them have mismanaged the plants after blooming. The varieties are all deciduous, and the roots are in the form of creeping rhizomes, and it is to be feared that when the plants have done flowering, they have been sadly neglected. They should be stood in a frame or on an ash-bottom, in a cool shady spot, and be closely looked after in the matter of water. If neglected, and the soil is allowed to become dust-dry, and to remain so, the roots become shrivelled up and perish. But if carefully watered as required, and especially sprinkled overhead, the pots kept clean of weeds, and worms prevented from finding their way into the pots, and loosening the soil about the roots, there is no reason why the plants should not be preserved in good condition till October, when they should be re-potted into a compost which will suit the Chinese Primrose, and wintered in a cold frame, covering up somewhat during a time of severe frost. R. D.

**CYTISUS SCOPARIUS VAR. ANDREANA.**—In March, 1893, I purchased a small plant of the above from Mr. Ware, of Tottenham, and immediately planted it in a border, the soil of which consisted chiefly of well-rotted turf from an old pasture. The plant grew very well, and had a few blossoms, which produced some seed-pods. The yield, however, was only three seeds. These were planted at once, but only one plant was saved. This seedling was kept in the conservatory during the winter of 1893-94, and in March it was planted in the same border as the parent. It grew vigorously, but did not flower. During the great frost of January and February, 1895, the original plant was killed, with the exception of its main stem, while the seedling remained quite uninjured, and during the remainder of last year attained a height of 5 feet, and as much through it at 4 feet from the ground. On account of its vigorous growth, as compared with the stunted condition of the parent plant, I imagined that it had reverted to the common Broom, and my gardener was very nearly digging it up; but I decided not to have this done until it had produced a flower. About a month since I was agreeably surprised to find that its flower would be the true variety *Andreana*. Having observed that the original plant had been worked upon some stock other than the indigenous Broom, I wrote to Mr. Ware for some information respecting it, when he replied that it had been worked upon the *Laburnum*. During the last week the seedling has come out loaded with bloom, and at the present time it cannot have less than 10,000 flowers upon it, which renders it a very striking and beautiful plant. I am of opinion that its seed will again produce the true C. s. a., in which case it will not be necessary to continue grafting it upon another stock, which, I believe, is generally the custom; moreover, it has shown itself more hardy upon its own roots. I should be very glad to see an expression of opinion upon this point in the columns of the *Gardeners' Chronicle*. C. Lecson Prince, The Observatory, Crowborough Hill, Sussex, May 21.

**A FINE WISTARIA CHINENSIS.**—At the south end of the mansion in which the Right Hon. S. H. Walpole resides at Ealing, is a very fine *Wistaria*, covering a great space. The specimen was planted in 1844, and now at 18 inches from the ground the trunk measures 5 feet in circumference; the topmost shoot has reached a height of 65 feet from the ground, and the branches have spread to a considerable distance on to the west and north fronts of the mansion. The south wall of the mansion is of considerable width, and the branches thus cover a

considerable area. At about 16 feet or so from the ground, immense main branches are put forth, and for some reason in past years this portion was kept free from growth. Mr. Rigden, who is now the gardener to Mr. Walpole, has very wisely allowed the branches from the main trunk to spread, and they now cover every space of the south wall. Every year Mr. Rigden prunes-back hard to the spurs, but neither age nor severe pruning affects its great floriferousness, while the racemes are very large and finely coloured. It is in all probability one of the first specimens, probably the first planted in Ealing. R. D.

**TYPHA MINIMA** is flowering for the first time at Markree Gardens. It was planted in its present position about nine years ago, and until this year it has never flowered; therefore, having arrived at its flowering stage, it is regarded as something novel. The position afforded a clump of the above is a damp one in the centre of the rockery, but I observe that it is growing between the rocks to a higher level, and seems to enjoy its drier root-run. I need hardly say, in a growing state it is graceful and pretty, and in a cut state, highly decorative, especially now we can add a few of its brush-like spikes of growths with the current year's growth of leaves, as you will observe the flower-spike is situated immediately behind the current year's growth, according to specimen sent. Is it a shy-flowering plant in other places? or does it require less moisture at the roots than ordinary *Typhas*, such as *T. angustifolia*, which thrives in a stream of fresh water? I am inclined to think a moderate supply of water suits it best. *Herbert May, Markree Gardens, Collooney, Sligo, Ireland, May 23.* [How does it differ from *T. angustifolia*? Please send piece of the latter for comparison. Ed.]

**FIMBRIATED BEGONIAS.**—While for years past raisers of new varieties of *Begonias* have been endeavouring to secure circularity of shape and smoothness of the petal-edges, the new fimbriated type, which Messrs. Laing & Sons, of the Stanstead Nurseries, Forest Hill, exhibited at the Temple Show, comes as a kind of protest against an adhesion to the old practice. They were welcomed by many as an acceptable break from the monotony of the smooth edges, and there was a peculiar attractiveness in the four varieties exhibited on this occasion; and probably had the blossoms of all four been fully developed, more than the one award would have resulted. That selected for an Award of Merit was *Duchess of Fife*, pale pink, the fringed edges to the petals being of a pale rosy-carmine—very pleasing indeed. The only other individual of the quartette which was named was *Laing's White*, which, with its companions, the salmon and pale rose flowers, will probably be seen again in a more matured form. But only a comparatively few other flowers can be said to be in their best form when the petal-edges are fringed, the Chinese Primrose being one conspicuous example. R.

**A PLAGUE OF MICE.**—If W. E. G. will send his address to the Head Gardener, Tasburgh Hall Gardens, Norwich, he will send him a trap that will catch them with very little trouble. *J. Scarlett.*

**RICHARDIA ELLIOTIANA WITH ABNORMAL FLOWERS.**—We have now (May 26) a plant of this species with two spathe around one spadix, both spathe being perfect in shape and colour, the inner spathe the smaller of the two. Can any reader of the *Gardeners' Chronicle* say if this is a rare occurrence? [Very common in the white species. Ed.] A. Reid, Jun., *Passingworth.*

**GEUM HELDREICHII.**—A plant bearing this name has just come into commerce, said to be from the Mysian Olympus. Can anyone tell me where I can find its characters described? I purchased two plants of it together last autumn from the same nursery. Both are now in flower. One is *Geum rivale*, pure and simple, without any mistake. The other in leaf, habit, stature (1 foot), size and form of flower, resembles *G. pyrenaicum*, but the flower is orange instead of yellow, and the sepals are entirely reflexed at opening, which is not the case in *G. pyrenaicum*. C. Wolley Dod, *Edge Hill, Malpas.*

**ROYAL SOVEREIGN STRAWBERRY.**—On paying a visit to the gardens of Herbert Harris, Esq., Bowden Hill, Chippenham, I was struck with a grand lot of Royal Sovereign Strawberries, in pots, averaging eighteen large fruits of good colour, and the flavour good, although, to my mind, it is not equal to that of President. Mr. Penton intends to grow this Royal Sovereign largely another year, as it is such a good doer

and well worth the attention of all gardeners who have to furnish forced Strawberries. F. P.

**LONDON IN MAY.**—In Regent's Park the Chestnuts on the Broad Walk are [were at the time of writing] in their prime. Of course there are more in Bushey Park and other places of these matchless caudelabras of beauty, as they have been finely called. But the Chestnuts here are without a speck or flaw, and look all the richer in contrast with the Elms and Limes, that add this special arboreal furnishing to the Broad Walk in May. Lilacs, Laburnums, Gueldres Roses, Rhododendrons budding into beauty rather than in full blossom, will be better seen when the glory of the Chestnuts is faded. Before, however, leaving the Broad walk, a sentence must be given to the muster of Tulips, in which it may be said to culminate at the far end. This bed of the soft and elegant Tulip *Gesneriana*, a lovely blend of cerise and violet, proves that mass may be as effective as might; the colour is the more welcome after gloating over the whites and greens of the Chestnuts. Here, too, were two other lions of the Park. Two huge vases, one furnished with Wallflowers, seldom elevated so high, but very telling from this point of vantage; and the other with a dwarf white Rhododendron, probably campanulatum, the white of which were simply magnificent. Amid all the arboreal beauty of these fine gardens there is yet room for greater variety of silver and other Maples, and Birches, purple and other Beeches, and the purple *Prunus Pissardi*. One of the striking sights of these gardens through May is the massive and wholesale use of the here perfectly hardy *Primula Sieboldi*. It is scarcely possible to describe its beauty, and yet, so far, I have not met with a single plant of this type or its many choice varieties in any other park or garden this year. Of course, the golden and varied show of Daffodils, the glow of Tulips and other bulbs, are almost over and gone for the season. On entering the gardens from Portland Road, the wood Hyacinths, white and other Narcissus in the grass, are still to the fore on a scale of imperial prodigality worthy of their beauty and the wealth and taste of the nation. Mixed Polyanthus of many forms and colours were also seen, while the whole gardens may be said to be bathed in the fragrance and painted with the beauty of Wallflowers and Stocks. D. T. F.

**DUTCH NAMES FOR TULIP SPECIES.**—I suppose we shall very soon hear of a conference to settle the confusion with regard to Dutch names that have been given to species of Tulip, and English names that are now given for old garden varieties. The sooner the better; and if we can trace back through hand-painted illustrations, the old garden sorts now being brought to the front, the names they had and were known by fifty years since should have the preference. I remember the old goblet-shaped *Gesneriana* forms, known as Silver Queen, York and Lancaster, &c. What are now called *Bouton d'Or* and *Golden Beauty* used to be known as *Buttercup* half-a-century since. This was before the rage for straight lines of bedding plants, such as *Lobelia*, *Calceolarias*, &c., caused them to be put in the rubbish-heap. The nomenclature of the regular florists' Tulips has been well preserved both in Holland and England, but in the case of self-coloured late varieties there will be only confusion if the Dutch and English traders do not come to some terms respecting names. For instance, I would suggest that what is sold in Holland as *Gesneriana major* should be called by its correct name, as it is known at Kew, viz. *Tulipa Gesneriana spatulata*. The true *Gesneriana* forms as follows, must retain their Latin names: *T. Gesneriana major rosea cœrulea*, blue based; *T. Gesneriana major rosea albo-cœrulea*, blue and white based; *T. Gesneriana major rosea albo-oculata*, white based; *T. Gesneriana major rosea striata*, blue based with striped flowers. The three latter are deliciously scented after the manner of *T. macrospila*, and the five forms are quite distinct as self-colours, yet, if you write to Holland for stock of one or other, you may get the very one you do not want, or you may get the entire lot in endless confusion and mixed. Just as in the case of *T. macrospila*, this lovely bedding sort will reach you in two mixed forms of major and minor, while from many of the Dutch nurseries both will be sent you as *Gesneriana major*, &c. All are beautiful objects when planted in large beds, as those lately seen in Hyde Park, &c. In the case of *Tulipa Golden Crown* and *Golden Eagle*, Mr. Baker regards them as forms of *Billettiana* [Didieri?]. They are known in Holland simply by confused names of one for the other, and when they come to England have already got new names. This will not do. It will only produce confusion. *Lauhart.*

WIDFORD LODGE,  
CHELMSFORD.

In gardening circles the name of Robert Warner calls up many noteworthy reminiscences. What Orchids his were! What pluck he manifested when in 1867 he upheld the honour of British horticulture at St. Petersburg! There are not many even now who would venture, as he did, to transport so fine and valuable a collection to and from the banks of the Nova. Thirty years ago or so the *Cattleya* and *Lælia*-house at Broomfield was a sight to be remem-

practice now, many other fine things were first bloomed; and among other now rare plants may be mentioned the large specimens of *Cypripedium Fairieanum* which came from the Fairie collection at Liverpool, and which used to be grown at Broomfield with *C. insigne*, which were kept cool, and even placed in a cold frame in a sheltered situation outdoors in summer where the plants had scant attention. Probably the difference in the robust condition of the plants so hardily grown, and the puny condition of the *C. Fairieanum* now in collections, may be accounted for by the coddling to which they, in

and so well screened that not much of them is seen even from the garden. A straight woodland walk, overhung with trees and bordered with Daffodils and wood Hyacinths, intermixed with Ferns, runs parallel with one of the roads. A similar walk on the other side divides the lawn from the kitchen garden. In every direction may be seen large beds filled with Roses, and Narcissi, Pyrethrums, and Blue-bells. Wallflowers and herbaceous plants generally. What can be the necessity for all this vast quantity of flowers for cutting? one is tempted to ask, till the reason occurs to us that Mr.

FIG. 114.—GROUP OF CARDINAL AND EARLY RIVERS' NECTARINES. (SHOWN BY MESSRS. RIVERS AT THE TEMPLE SHOW.)  
(See Report, p. 650, in issue for May 23.)

bered. There might be seen dozens of large specimens of the best class of *Cattleya Mossiae*, each bearing twenty to forty or more flowers; there appeared by the dozen forms of *Lælio-Cattleya elegans* and *L. C. Schilleriana*, one section of the strain giving material for that fine form figured in *Warner's Select Orchilaceous Plants*, i., t. 6, as *Lælia gigantea*; there *Cattleya Warneri* first appeared in 1860, when larger masses of it probably than can now be found, either in its native habitat or in cultivation, bloomed and caused quite a sensation among orchidists. In this long *Cattleya*-house at Broomfield, which was a rather flat lean-to, often swept by the winds of the Essex levels, and which was kept cooler than is generally the

common with other rare plants, are now too often subjected.

In the olden time the house with ornamental water in the centre, besides which seats were placed at one end, used to be adorned with a selection of whatever Orchids happened to be in flower, and many a brave show was made there which would cause modern Orchid growers to open their eyes. In more recent times the collection from one cause or another has been much curtailed.

Mr. Warner's present residence is, like his former one, in the close vicinity of the town of Chelmsford. The surface of the garden is flat, bounded on two sides by public roads, invisible from the house,

Warner and his family look upon themselves as trustees for the poor and the sick, and bounteously share their possessions with those not so well provided with the amenities of life. Some of the London hospitals are regularly provided from this garden, and who can gauge the pleasure, the hope, the trust these flowers may serve to elicit?

The lawn to which we return is spacious, bestrewn with flower-beds, not as yet filled with their summer occupants at the time of our visit (May 15), and some not yet devoid of their spring tenants. Mr. Warner shows himself a true gardener. "Look at that bed of *Rhododendrons*—my seedlings," says he; and a similar remark is made with *Carnations*

and Pansies, and even Apples and vegetables. Mr. Warner, indeed, in horticultural matters remembers St. Paul's injunction to "prove all things, and hold fast that which is good," for his eye is still keen, and his judgment good. On the lawn are two specimens of *Chamerops Fortunei*, which have been out all the winter; but it is clear the Essex climate is not suitable for this Palm. Far otherwise is it with a noble *Pinus*—*P. Pallasiensis*, whose dark dense foliage and stately habit contrast well with the spreading branches and light green foliage of a cut-leaved Beech. This Beech, by the way, reveals its origin by throwing out a branch bearing leaves of the ordinary character. Two or three trees of the "sportive" Adams' Laburnum occur in the grounds, and excite the usual feelings of surprise. *Genista Andreana* is a "sport" from the common Broom, its deep red-brown wings render it excellent as a variety; though those who see the railway banks on the journey down aglow with the Broom will not put it in the second rank, even though it be the "common Broom." Another very beautiful shrub, with papery-white blooms of large size, is *Exochorda* (*Spirea*) *grandiflora*, a plant that everyone admires when he sees it, but which, nevertheless, we do not often meet with out of botanic gardens. *Berberis stenophylla* × forms a beautiful and efficient hedge, encircling a large area given up to Roses and flowers for cutting. *Clematis montana* decks the walls with a profusion of white starry flowers; whilst *Crimson Rambler*, *Maréchal Niel*, and other Roses are quite at home on the walls of the house. Under glass there are still, as we have said, a few Orchids, chiefly *Laelias* and *Cattleyas*, and sufficient provision for the large supplies of bedding plants demanded to fill the numerous beds on the lawn, as well as for the household requisites in the way of Grapes, &c. But of all the houses, one stands out prominently in the recollection, and that is a large conservatory. We do not know whether best to call this a fernery or a palmarium. In truth, it is both; it is full of Ferns, Tree-Ferns, and other, and one end is filled with a magnificent specimen *Latania*, whose noble palmate leaves at once arrest attention. Here, regardless of inclement weather, the veteran gardener may thankfully admire and wonder, as all gardeners do; and musings recall the feats and deeds of time past. Long may he continue to enjoy the blessings which this faculty of appreciation confers.

## A CONTRIBUTION TO THE HISTORY OF PANSIES.

OPINIONS vary among botanists as to the origin of the cultivated Pansies. Charles Darwin discussed the question in his *Variation of Animals and Plants under Domestication*, but arrived at no definite conclusion, saying on p. 369, "Hence, after having carefully compared numerous varieties, I gave up the attempt as too difficult for anyone except a professed botanist."

My own investigations have led to the following conclusions:—

The botanists of ancient days knew of only one kind of *Viola*, namely, *Viola odorata*, L., and those of the Middle Ages were acquainted with no other.

The Heartsease, or wild Pansy, *Viola tricolor*, L., was first mentioned and described by O. Brunfels (1533), and L. Fuchs (1542), both Germans. The latter relates that "*Herba Trinitatis*"—the name by which the Heartsease was then known—was not only found wild, but was also cultivated as an ornamental plant in the gardens of Germany.

The name Pansy, so far as I have been able to make out, is used for the first time in botanical literature in 1537, by the Frenchman Ruellius, where it occurs in the Latin form *Pensea*.

R. Dodonæus, from the Netherlands, is the

first to use the name *Viola tricolor* for the Heartsease.

From the works of Dodonæus, Dalechampsius, and Gerarde, we learn that during the latter part of the sixteenth century the Heartsease was used as an ornamental plant in the Netherlands, France, and England, and that the flowers thereof showed no slight variety of colouring.

Parkinson, in 1629, describes and delineates not only the common *Viola tricolor*, but also a form with double flowers from gardens in England.

From the middle of the seventeenth century *Viola tricolor* has existed as an ornamental plant in Italy, Denmark, Sweden, and Poland.

We learn from J. W. Weinmann, Ph. Miller, and D. Villars that *Viola tricolor* was a very general ornamental plant in Germany, England, and France during the eighteenth century, and Weinmann's *Phytanthozoa Iconographia*, published in 1745 (with coloured plates), enables us to form an exact idea of the appearance of the Pansies at that time, as the eight coloured figures representing Pansies show flowers that are neither larger nor otherwise coloured than the varieties of *Viola tricolor* growing wild.

Besides those small flowering *V. tricolor* Pansies already mentioned, from the sixteenth to the eighteenth century more large-flowering kinds were cultivated, even if but seldom, of *Viola lutea*, Huds., growing in the mountainous districts of Germany, Switzerland, and England. C. Clusius, the renowned botanist, in 1583 gave the first description of this plant from specimens cultivated in the gardens of J. Camerarius, of Nuremberg. In the celebrated Bishop's garden, at Eichstett, in Bavaria, four varieties of large-flowered *V. lutea* Pansies were cultivated in 1613, all being delineated in the gigantic *Hortus Eystettensis*.

J. Parkinson mentions the great yellow Pansy as in cultivation in England in 1629.

From Holland and Poland there are also statements concerning the cultivation of large-flowering Pansies in the seventeenth century, doubtless *Viola lutea*.

That this species was cultivated in England during the eighteenth century is proved by a statement by Ph. Miller in the *Gardeners' Dictionary*. Miller certainly calls the Pansy in question *V. calcarata*; but as he expressly states that it came from the mountainous districts of North Britain and Wales, there can be no doubt that the true *V. lutea*, Huds., is really meant. *Viola calcarata*, as is well known, is not found in Great Britain, being a native of the Alps.

All the Pansies of the sixteenth, seventeenth, and eighteenth centuries may be called wild Pansies, as in all essential points they resembled those growing wild; and it is only in the present century that, thanks to the action of man, those numerous varieties of garden Pansies have been produced which, in their display of flowers, so vastly surpass their wild relations.

The Pansies of the present day were originally raised in England. In the early days of the present century several amateur horticulturists in England began to pay special attention to the Pansy, as for instance, Lady Mary Bennet, of Walton-on-Thames (1810), Lady Monke (1812), and Lord Gambier, of Iver (1813 or 1814), who instructed their several gardeners—of whom Thomson, of Iver, deserves special mention—to obtain as many varieties of wild and cultivated Pansies as possible. Seeding

was now undertaken on a large scale in specially suitable soil, and from the seedlings thus obtained those with the largest and most beautiful flowers were selected; and continued selection was made in this way year after year. By these means no small number of unusually beautiful and large-flowering varieties were obtained, which were undoubtedly largely hybrids, that, without any intervention from man, were produced by insects which, on visiting the flowers of the different varieties and species cultivated side by side, caused a rich cross-fertilisation. The species of *Viola* cultivated were those native to England, viz., the common Heartsease, *Viola tricolor*, L., and the yellow large-flowering *Viola*, *V. lutea*, Huds.

The last mentioned was cultivated on a large scale at an early date, as is proved by a statement made in 1819 by Dean Herbert, the well-known horticulturist and botanist, that "the great Heartsease," which, under the name of *Viola grandiflora*, was then sold at Covent Garden, was identical with *V. lutea*, Huds., from Yorkshire and Durham.

A circumstance especially favourable for the formation of new varieties of Pansies, is that the hybrids of species of that section (*Melanium*) to which belong the two species just mentioned, as a rule are more or less fertile, while hybrids of species belonging to other sections are generally sterile.

Reliable statements prove that dating from 1816, *Viola altaica*, Ker, a native of Siberia and the Caucasus, was cultivated in England. It is more than probable that this species played some slight rôle in producing some of the Pansies of those days. Several authors have even ascribed so much importance to the part played by *Viola altaica* in the origin of the Pansies that they consider it their real parent. This is, however, in my opinion, a mistake, as, with the exception of bearing large flowers, the Pansies of our century have scarcely a single characteristic in common with *Viola altaica*, and this species seem always to have been—as it still is—a great rarity in European gardens.

During the twenties and the thirties, the cultivation of Pansies became more and more general in England. J. Harrison tells us that from 1827 to 1833 nearly 200 new varieties of Pansies were raised; while Charles Darwin relates that in 1835 there were 400 named varieties of the Pansy on sale in England.

An account of the then demands on a good Heartsease was given by J. Paxton in 1834: "The flower-stem must be of sufficient height and strength to raise the flower above the foliage of the plant; the petals of the flower large, flat, and without notch or fringe on the edge. The colours must be clear, brilliant, and permanent. The eye should be small compared with the size of the flower." *V. B. Wittrock, Stockholm.*

(To be continued.)

## Obituary.

ANDREW S. FULLER.—Andrew S. Fuller, widely known as a writer on agriculture, horticulture, and arboriculture, died suddenly, as we learn from the *American Florist*, at his home, Ridgewood, N.J., May 4. He was born in Utica on August 3, 1828. When a boy, he removed with his parents to Barre, in Orleans county, and at the age of eighteen went to Milwaukee and began the life of a florist. While in Milwaukee he married Miss Jennie Crippen, and in 1855 they removed to Flushing, where he became foreman for William Prince, the nurseryman. He stayed there a year, and then, with his wife, went to Brooklyn, where for nine years he had a garden

and raised small fruits. During this time he began writing on horticultural matters. Early in 1860 he went to Ridgewood.

Mr. Fuller was connected with the *Tribune* until the *Weekly Sun* was established, when he became its agricultural editor, remaining in the place for twenty-six years, as long as the publication was continued. He also edited at one time the *Rural New Yorker*, and wrote for the *Agriculturist*, *American Gardening*, and the *Florists' Exchange*, and published various books, including the *Strawberry Culturist*, the *Small Fruit Culturist*, the *Grape Culturist*, the *Propagation of Plants*, and *Practical Forestry*. His last book on *Nut Culture* is now in the hands of the publishers, and was to have been issued in about a month.

Mr. Fuller made a special study of entomology, and collected a large library, and a cabinet of specimens. He was an authority also on pre-historic American pottery, and had collected specimens of it. He was an enthusiast in anything that related to natural science.

## SOCIETIES.

### MANCHESTER ROYAL BOTANICAL AND HORTICULTURAL.

MAY 21-27.—The usual Whitsuntide Show was opened under distinguished auspices, the shareholders and members with their wives and families flocking in considerable numbers to support the Earl of Derby at the formal proceedings of what for the last quarter of a century has been the great show of the North of England. The Show house which has been reserved for a good many years for Orchids alone was pretty well filled, and the colours of the tooth-tongued fraternity of the race (*Odontoglossums*) were all the more striking contrasted with brilliant *Cattleyas* and *Lælias*, and the duller colours and quieter forms of *Cypripediums* which are now, in point of numbers and varieties, particularly of seedlings, getting beyond the grasp of most orchidists. The only thing one has in a measure to regret, looking twenty-five years back, is that there are not the specimens in exhibit showing the cultural hand, but what is wanting in specimens is more than made up by quality of individuals. To be sure there are thousands of plants exhibited which are only of *Pelargonium* value, but still they all make up a grand floral display. The *Hippeastrums* are gaining in decorative importance after the florist's standard; *Pelargoniums* and *Roses* are as good but no better than in the days of yore; *Calceolarias* and *Begonias* are much improved both in form, colour, and habit, and border flowers have a freshness and brilliancy that command general attention. Indeed the Annex was as brilliant as ever, the *Azideas* being much better flowered than we have seen them for years. The prizes upon the whole were keenly contested for, there were few run-away victories in any of the classes. There was quite a sheaf of First-class Certificates awarded—too many in fact to stamp all the articles with first-class importance, thus giving colour to the contention of not a few that decentralized power, outside of the London Committees, in adjudicating upon novelties, would not be attended with uniform good effect.

### COMPETITION CLASSES.

#### Collection of Orchids in bloom (Amateurs).

E. ASHWORTH, Esq., Harefield Hall, Wilmslow (Mr. Holbrook, gr.), took first position with a varied lot, among which were some charming species and varieties. *Lælia purpurata* was shown in considerable numbers, studded in the background with a variety of *Cattleyas*, among which *C. Schroderae* was prominent, its fully formed *labellum* enriched with the great solid orange blotch effectively caught the eye. *C. speciosissima nobilior* is a large striking well-coloured flower, with the tip unusually broad and the marking and spotting on the pale ground is very telling. *Cattleya × calummatata* has more of the female parent (*Acklandæ*) in its features than the pollen parent, *intermedia*. It is beautifully spotted in all its segments, and reminds me more of *amethystoglossa* than *intermedia*, in that wise the so-called pink turning blue—*Cattleya Mossiæ Gaskelliana* is neither pink nor blue, as exemplified in too well-flowered plants, but only an ordinary *Mossie* with good segments but small *labellum*; *C. Mendelii* was fine. *Lælia tenebrosa* was brilliant in its high-coloured lip with narrowish segments. This is a great gem to the *L. grandis* section. There were also *Cypripediums* of sorts, *Dendrobiums* of sorts, none better than *D. Dearei*, which, to handsome foliage adds beautiful white flowers, improved, so to speak, by the green crest. There were also several *Lycaste Skinneri*, *Schomburgkia tibicinis*, lots of *O. crispum*, and some good *Miltonia vexillaria*, &c.

FRED HARDY, Esq., Tyntesfield, Ashton-on-Mersey (Mr. Stafford, gr.), was 2nd. In this collection were some very

good *Lælia purpurata*, none better or more chaste than the *L. p. Schroderae*, which may be said to be the finest form of *Russelliana*, having a large finely-formed lip with distinct radiating soft rosy lines. Standing up in relief in the background were good examples of *Dendrobium D. hirsutum*, and the effective yellow *D. fimbriatum oculatum*, fronted with a choice assortment of *Cattleyas*, including *Mossie*, *Mendelii*, *Schroderae*, interspersed with circlets of scores of *Odontoglossum crispum*, very showy without being of particularly fine quality. A grand variety of *Cypripedium villosum*, was shown, with lips of unusually deep colour, and shading out in the dorsal sepal to a greenish white. We also noticed with pleasure the beautiful white *Diacrium* (*Epidendrum*) *bi-ornatum* with two fine spikes of its snow-white flowers. *Dendrobium thyriformum* was in good form, colour, and flower, and there were some well-marked *Cypripedium bellatulum*.

S. HENCHIFFE, Esq., Hale, Altrincham, had a few good *Lælias* and *Cattleyas*, *Oncidium* of sorts, among which was the old *O. sphecelatum*, still useful for collectors. The showy yellow *Anguloa Clowesii* was very effective; and so was the bronze-coloured *Cattleya Schilleriana*.

#### Collection of Orchids in Bloom (Nurserymen).

Mr. JAMES CYPHER, Cheltenham, had a very good and effective lot, which were placed in the post of honour at the top of the Exhibition-house rendered particularly effective by a background of *Palms* again confronted with specimen of flowering plants. The great profusely flowered bushes of *Erica Cavendishii* and *E. depressa* formed a fine golden foil to the thistle-looking *Aphelxis macrantha rosea* which is still the most beautiful variety. The soft rose of the *Pimelia* flowers, and the brilliant scarlet of the *Flamingo* plant, gave both the specimens themselves, and the Orchids confronting them a very stylish appearance. Mr. Cypher has always showed *Lælia purpurata* well, this time his collection was lessened by what was in exhibit at the Temple. Still the *L. purpurata alba*, as well as the darker forms, are both well-grown and flowered. *Cattleyas* were well represented, the *C. Skinneri* being a particularly rich variety in a well-flowered plant. Among others, we noticed the too seldom seen *Vanda suavis*, pretty pieces of *Oncidium macranthum* and *O. serratum*, the lemon-coloured *O. concolor*, *Epid. O'Brienianum*, which seems a perpetual flowerer among the various sections. The best of the *Cypripeds* were *C. × Ewerianum*, a good grower and one like *C. Lawrenceanum* that hold its segments and its dorsal sepal in one plane.

Mr. JOHN KIRSON, Bowden, was 2nd with a lot of well-grown plants. Among them was one of the best varieties of *Cattleya Mossiæ* in the exhibition of the dark type with an unusually decorated amethyst lip. *C. labiata* was also good with about a dozen high-coloured flowers. *Cypripedium grande-atratum* was in rude health and a good average flower. *Odontoglossum crispum*, *Dendrobium × Cassiope*, contrasted well with the orange-scarlet *Epidendrum vitellinum*.

Messrs. HEATH & SON, Cheltenham, were 3rd. Among this lot were quantities of *Miltonia vexillaria*. *Cattleya Skinneri* was good. We also noticed among others *Odontoglossum citrosum* and the large flowered *Aërides crassifolium*.

#### Collections of Cattleyas and Lælias (Open).

THOS. STATTER, Esq., Stand Hall, Whitefield (Mr. Johns n, gr.), showed a good collection, the only indifferent plant in the lot being *Lælia grandis*; the plants of *L. purpurata* at Stand are a notable lot, none better than the variety named *Statteriana*, which to brilliancy of lip adds fine broad flat segments; there would be a score of flowers or more on this plant; the white and the red varieties are also good. *C. Mendelii leucoglossa* is a chaste fine variety, but it was a little past its best. Among others the most striking was *Cattleya Gravesiana*, a high-coloured flower with the orange clouding through it which marks its distinctness, and renders it a most desirable variety. Mr. Statter took an award for an example of "Hybrid *Cattleya* or *Lælia*" with *× Cattleya Pallas superba*.

FRED HARDY, Esq., was 2nd, having a well-grown and particularly fine quality *Cattleya Schroderiana* with a dozen flowers; *Cattleya Skinneri alba*, not quite white; *Lælia purpurata Schroderiae*, *Cattleya Mendelii* var. *Venus*, a very good *Cattleya dolosa*, *Cattleya Schilleriana* Hardy's var., &c.

#### Collections of Cypripediums in bloom (Open).

E. ASHWORTH, Esq., took 1st prize, having, among others, *Cypripedium bellatulum album*, showing a yellowish crest, being only a freshly-expanded flower. There were several of the best forms of *Chamberlainianum* that we have seen, and a large general lot. THOS. STATTER, Esq., took 2nd prize, the best plant being *C. × Gertrude Hollington*, the white *C. candidum grande-atratum*, and the too seldom seen *C. levigatum*. F. HARDY, Esq., was 3rd, his best being *C. Lawrenceanum Hyeannum*, *C. Ewerianum*, *C. leucorrhoda*, *C. Druryi*, &c.

#### Collections of Dendrobiums in bloom.

Mr. J. CYPHER, 1st; Mr. E. ASHWORTH, 2nd. The most striking among the lot was the enurpled *D. glomeratum*, *D. albo sanguineum*, and several *D. nobile*.

#### Collections of Odontoglossums in bloom (Open).

F. HARDY, Esq., had a good lot, comprising *O. crispum*, *O. Andersonianum*, *O. Harryanum*, and others in variety. Mr. JOHN ROSSON was 2nd with fresh grown plants of *O. crispum*, and several good varieties of *O. Rozeii*.

#### Specimen Orchid in bloom (Nurserymen).

Messrs. HEATH & SONS, Cheltenham, were the only exhibitors in this class, showing among other things a well-grown specimen, and a good variety of *Lælia purpurata*.

#### Orchids not entered for Competition.

F. SAMOER & Co., St. Albans, had by far the largest and finest group, and well deserved the large Gold Medal awarded. Among the more striking plants, we noted *Cattleya Mossie Reineckiana*, not fully-developed, but having about two scores of blooms. It was remarkable for having two flowering growths from the same centre, in more than one instance. *Miltonia vexillaria Chelensis* is a good, distinct flower, with solid, pink, radiating lines on base of lip, stopping short at the centre. *Epidendrum atropurpureum* Randi was one of the best and most distinct things on exhibit; the flowers are much larger than in the type, the segments bright sienna colour and well shaped, and the white and dullish-purple lip large and unexceptionally well formed; the plant had fourteen spikes of flowers on it. *Stenoglottis longifolia* is an Orchid-looking plant, sending up spikes about a foot long of lovely lilac and purple-spotted flowers—quite an acquisition. *Cypripedium Rothschildianum* had half-a-dozen well-developed flowers; *Oncidium Rogerii*, so-called, was one mass of blossom, making an effective specimen plant; *Dendrobium Bensone*, is a beautiful *Dendrob.*, silver in hue, with a dozen spikes on it. There were several *Od. crispums* of nondescript character for one fine-formed one. *Cattleya Mendelii* Countess of Derby, is chaste, without being either one thing or another; *Cattleya Mossie*, Her Majesty, is a well-formed flower; the pale hues down the centre of its segments do not add to its importance. There were several good forms of *Lælia purpurata*, the most distinct among them being one named *Distinction*, having a soft mauve expanded lip. *Miltonia vexillaria leucoglossa* is a flower of large size, well-named from its white lip set against rose segments.

In addition to the Orchids were some good *Palms*, particularly *Geonoma acaulis*; *Hypericum Moserianum tricolor* which will make a pretty border plant. The best of the *Legonias* was *Lucey Clowes*, with prominent metallic leaves. The best of the *Sonerilas* was *James Hamilton*, densely and regularly spotted. The seedling *Streptocarpus* were notable, particularly the exhibits with almost indigo colours.

CHARLESWORTH & Co., Heaton, Bradford, had a selected, choice lot, among which were a few of the best *Od. crispums*. The *Bankfield House O. crispum* is a large, finely-developed flower, clouded with red on a pale base; the *Vine House* variety is also very good, finely spotted, but wanting in form. Several others of normal type were exhibited. *Cattleyas*, particularly *Mossie eximia*, were good, and in some size, too; and there were several good *Lælia purpurata*, and a good *Cattleya Schilleriana*, and several other good things.

Alongside of this exhibit was a fine flower of *Cypripedium × Gertrude Hollington*, of great breadth of segments, and a grand dorsal sepal, by far the finest form yet exhibited, shown by A. WARBURTON, Esq., Vine House, Congleton.

Messrs. COWAN & Co., Garston, had a large showy lot, comprising some very good *Cattleya Mossie* and the white segmented *Reineckiana*, a variety like *C. M. Maguire*, only having a pale rosy blotch, a very fine *C. Harrisii*, the fiddle-shaped *Coleogyne pandurata*, the rhubarb-scented *Dendrobium macranthum*, the thyrse bloomed *Dendrobium*, the bright orange *Ada aurantiaca*, the spider-looking *Brassia verrucosa* in fine specimens, &c.

#### Miscellaneous.

B. S. WILLIAMS & SON had a miscellaneous assortment, comprising some good Orchids, the best among them being *Odontoglossum Wilckeianum*, which looks to me an improved *O. radiatum*. *Cattleyas* and *Lælias* were to the fore, and some good examples, the brightest and best one being quite as good in colour and as clear of greenery at the base as the old and well-known *formosissimum*.

Messrs. KER & SON, Liverpool, had a grand jarray of *Hippeastrum* (*Amaryllis*), some of the best shown being unnamed seedlings. They were all remarkable for the shortness of their scapes and the size of flowers. *Momus* was one of the best crimson; *Czarina*, a beautiful flower, after the colours of *Marguata conspicua*, but having much finer formed flowers. *Nestor* is also a dower of good quality.

C. DIBB, Esq. (Mr. Briardrett, gr.), exhibited a *Cattleya Mendelii* bearing three spikes of flowers, one of the spikes having six flowers, and of fully average size and quality. It had been "grown in a greenhouse for the last seven years," and the pot was one entangled mass of roots, showing clearly that it had not been potted for years.

The last exhibit in the Showhouse we notice was a splendid example of the fruit of *Eucepharctos villosus*, about a foot long, and as yellow as a ripened *Pine-apple* with the scales, not unlike those of that fruit. It was from the collection of JAMES WATTS, Esq., Abney Hall (Mr. R. McKellar, gr.). It well deserved the First-class Certificate it received. The same exhibitor showed a dish of *Afriston Apples*, and *Black Hamburgh* and *Foster's seedling Grapes*.

Mr. CHAPMAN had on exhibit a very good collection of dried Orchid flowers with the colours well conserved.

### THE ANNEX.

#### Group of Plants (Nurserymen).

R. P. KER & SON was the only exhibitor. The lot was graceful, being a green ground relieved with standard *Crotons* of good sorts, highly coloured. The *White Harrisii Lilies* tell well in a group of this kind, and the greenery of *Palms* and *Ferns* along with elegant outline are always eye-pleasing. A very effective frontage was made up of dark crimson *Gloxinia* resting on fine stiff foliage.

## Group of Plants (Amateurs).

1st, Miss Load, Ashton-on-Mersey; 2nd, Mrs. BLAIR, Whalley Range. These were of similar type to those of Messrs Ker, a little more of the Cork being used for "pocket" work. These collections furnished the chief prize lots in Cinerarias, Calceolarias, and Gloxinias.

CHARLES TURNER & SON, Slough, had a fine group of Roses in pots, the more prominent being the yellow Celine Forestier, the Crimson Rambler, the fine bluish Merveille de Lyon, and the finely cupped pink Rose Spenser. The group of Pelargoniums from the same firm was equally meritorious. The more prominent among them were: Rosy Moru, Miss Louisa Curle, Gold Mine, St. Blaise, &c. In Azaleas, Mr J. CYPHER had a well-flowered lot, the mauve Codo Nulli being very effective. R. P. GILL, Ashton-on-Mersey (Mr Plant, gr.) also exhibited in this class. Mr. GILL had also a good lot of herbaceous and border plants in pots, and some good Ferns. DICKSONS, Chester, had a brilliant display of border flowers, comprising Pyrethrums in various shades as well as Centaureas, Poppies of which Papaver bractescens was notable. The Misses HOPKINS, Mole Cottage, Knutsford, had a side well-filled with cut border flowers, and a great variety of hardy Viola.

TH S. S. WARE, Tottenham, had a splendid assortment of Tuberos Begonias in both single and double flowers; the yellow Gollath among the single ones is a very striking flower.

W. CUTRUSH & SON, Barnet, had a miscellaneous assortment of plants and flowers of generally sturdy character, the collection of Carnations in pots being very attractive. Messrs. COWAN & Co. had a circular embankment filled with dwarf showy Roses for greenhouse decoration, and a big lot of Spiraeas.

SUTTON & SONS had a grand assortment of Calceolarias, strong in the stem, and crowded with bunches of their bag-like flowers. Gloxinias, too, were very notable, as were most of their flowers on exhibit. Their Kidney Beans seemed to be prolific. Best-of-all and Tender-and-True, taking the eye. Their Tomatos were grown in pots, and the haulms strung round a girdle-like trellis, full of green, and ripening fruit.

MR. JOHN WATERER, Bagshot, had a great lot of hybrid Rhododendrons, which made capital furnishing for the other end of the Annex. The best varieties in flower were the large white George Hardy, the prominent rose-coloured Cynthia, Countess of Normanton, a fine lilac; the heavily-blotched Marchioness of Lansdowne, Kate Waterer, Mrs. John Clutton, &c.

FIRST-CLASS CERTIFICATES were awarded to Charlesworth & Co., for *Odontoglossum crispum* Warburtonianum, described in report; *Odontoglossum Charlesworthianum*, described in report; *Cypripedium Coroleum*, var. *Annie Louise*, Captain Schofield, in Temple show Report. To F. Sander & Co., St. Albans, for *Stenoglossis longifolia*, described in report; *Epidendrum atropurpureum* Randi; *Cattleya Mendell* Countess of Derby; *C. Mossie* Her Majesty; *Laelia purpurata* Distinction; *L. p. alba* violacea, dark purple lip, too crumpled; *Miltonia vexillaria leucoglossa*, described in report; *Licalala gracilis*, fan-formed leaf, only slightly cut in at extremity; *Begonia* Mrs. W. E. Elphinstone, good formed leaf, pale green with black round centre; *B. Confucius*, good formed leaf, edges and centre blackish-green, mainly spotted; *B. Lucy Cloisar*, described in report; *Sonerila* Mrs Margaret Moire, in the way of but larger and better than Henderson; James Hamilton, described in report; *Hypericum Moserianum* triangular, the carmine edge of oblong leaves very telling; *Geonoma acuminata*, fine light shade of green with large bifurcated leaves on short footstalks as if clipped with shears across the ends. Thos. B. Ware, for *Begonia tuberosa* Lord Derby, good dark crimson (double); *B. t. alba* virginalis, double white; *B. t. Leviathan*, double pink; *B. t. Begley*, dark rose.

## ARTICLES SHOWN ON THE LAWN.

HENRY & JULIUS CÆSAR, Knutsford. A variety of Rustic Houses, Chairs, Vases and such like garden requisites.

B. HARLOW & SONS, Ironfounders, Macclesfield. A set of their Tubular Boilers, in which the tubes are like flattened bottles for using up heat as it passes from the tube fire-bars, said to be capable of heating 3,000 feet from their 6-tubed boilers. Also smaller boilers with corrugated sides.

WALTER & Co., Leytonstone. A skeleton Greenhouse, showing their system of chip and lath blinds, in which the laths are about 1½ inches, with an ½ inch opening for light. It seems a good thing of the kind—all the better, too, because the blinds are set in Tiron bars 12 inches from the glass, thus allowing a free play of air in hot weather.

HALLIDAY & Co., Middleton. A set of span-roof houses fitted complete with stage and flooring, apparently neat and good; also a set of frames for useful strong work about a garden.

LEECH BROS., Millgate, Manchester. A very large exhibit of all kinds of chairs and lounges—everything conceivable for taking it easy in the garden or grounds. Also a set of rollers and mowing machines, along with wire designs for training up climbers, &c.

## Walter &amp; Co.'s Lath Roller Blinds.

Among the exhibitors of horticultural structures and appliances, was a skeleton-house (unglazed) covered entirely with Walter & Co.'s (of Leytonstone) Improved Lath Roller Blinds, the exhibit coming in for a considerable amount of attention from horticulturists of all classes, each of whom seemed to be able to devise some new use for such structures. Practically, it seems to be the very thing we suggested when giving an illustration of a "Chick House" at Gaisih Kund, India, in the *Gardeners' Chronicle*, January 7,

1888, p. 18. In the tropics some rude kind of lattice-protection is one of the greatest aids to horticulture; and in this country, properly used, there is no doubt that similarly good results might be attained at small cost.

Hitherto, the use of these roller blinds (which are improvements on those which have given the Continental grower of Orchids incalculable advantages for many years) have been confined chiefly to shading Orchid and other plant-houses, and there is no doubt that their use in gardens will much simplify the culture of these plants, for while giving the necessary shade, they admit also a sufficient amount of clear light, which cannot be said of any kind of cloth-shading. Probably one of the most interesting developments of these blinds will be, as we have before stated, when they are used by amateurs who do not possess glass-houses, for the protection of the rare hardy plants which so many of them find a pleasure in. Made as these are of Oregon Pine, coated with preservative solution, they last as long as a plant-house.

## MANCHESTER NOTES.

FLOWERS AT OLD TRAFFORD.—In the Manchester Royal Botanic Gardens the scarlet and pink double Thorns, which are planted on each side of the broad walk, and at intervals in the grounds, have been more beautiful this year than they have ever been, and for a long time past they have been the chief feature in the beautiful display of bloom on the great variety of hardy flowering shrubs with which the grounds have been so skilfully planted. Mr. Bruce Findlay, the genial curator of these gardens, has a special liking for flowering shrubs, and a keen eye for effect in planting them, and as the winter has been exceptionally favourable, a greater variety than usual, and having an unusually long duration, has embellished the Old Trafford Gardens this year. Great masses of colour meet the eye at every point, as the bright clumps of Rhododendrons and other things appear, but none of them can at present vie with the coloured Hawthorns.

A hasty walk through the glasshouses showed the Orchids in good condition, with a fair show of *Laelia purpurata* (of which there were about thirty spikes), *Cattleya Lawrenceana*, *C. Schroderae*, &c. In the lobby was a bright group composed of *Laelias*, *Cattleyas*, *Dendrobium Devonianum*, *D. superbium*, *Miltonia spectabilis* radians, and *M. vexillaria*, with *Odontoglossum citrosimum*, and other pendent species overhead.

In gardens open to the public, some things must necessarily be difficult to manage, but here the fine bank of *Cypripediums* which occupy one side of the large house are in such splendid condition, and so perfectly healthy and clean, that they must cause something like envy to those who are not so successful in their culture. Curiously enough, those kinds, such as *C. bellatulum*, which many amateurs cannot induce to grow for any length of time, are the most robust. In bloom among them were *C. Chamberlainianum*, *C. exul*, *C. bellatulum*, *C. × vernixium*, *C. × Dominianum*, *C. × grande*, *C. Lawrenceanum*, *C. × Ainsworthi*, and others; and in the same house were a good batch of *Vanda Kimballiana* in splendid condition, and some *V. suavis*, *Cymbidium Lowianum*, *Oncidium ampliatum*, *Phalenopsis Schilleriana*, *Cattleyas*, &c., in bloom.

In the greenhouses the Azaleas arranged with Japanese Maples and other plants, were very effective; the beautiful specimens of *Schizanthus* covered with flowers; the New Holland plants bright with flowers, and arranged with them some showy Cacti, *Rhododendron* Countess of Haddington, *Hæmanthus magnificus*, &c., the whole being edged with plants of *Prinula obconica*, covered with their pretty flowers.

The fernery rockery at Old Trafford is one of the prettiest things of its kind to be found, and every year adds to its attractions, as the plants with time arrange themselves in the most natural manner. In the tropical-house the giant *Medinilla magnifica* is again sending out many flower-spikes, and *Rudgea macrocephala*, the scarlet *Anthuriums*, &c., making a good show with the *Hoya carnea*, *Combretums*, and other climbers on the roof. Everything about these popular gardens is neat and well kept, and the curator must be congratulated on his success.

## MARKETS.

## COVENT GARDEN, MAY 28.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Eo.]

## NEW POTATOS.

Supplies coming to hand continue to be very small samples, both from the Channel Islands and France. Prices keep firm, with a tendency to improve on best. Consignments from Canary are dropping off, and demand in consequence is rather better than last week. *J. B. Thomas.*

## SEEDS.

LONDON: May 27.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's market was thinly attended, and presented quite a holiday appearance. Wheatmen, holders of Clover and Trefoil seeds express confidence in higher prices later on. Occasional small orders drop in for Tares. Bird seeds show no movement. Peas and Haricots are steady. Other articles at this inactive season call for no comment.

## CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.) for the week ending May 23, and for the corresponding period last year.—1896: Wheat, 23s. 6d.; Barley, 21s. 8d.; Oats, 14s. 6d. 1895: Wheat, 23s. 5d.; Barley, 21s. 12.; and Oats, 15s. 9d.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

 10, Ireland, S.; \*Channel Islands.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

TREE FERNS.—Will the person for whom we put in an enquiry in the issue for April 11 last, kindly furnish us with his proper name and address, so that we may forward a communication which has been received from the West Indies.

ARTIFICIAL MANURES FOR TOMATOS: W. P. H.  
 (1) Without possessing any knowledge of the particular soil you have to use; or of other manures you may have added, we may say that, generally speaking, a limited use of nitrate of soda is beneficial, if used with great care. (2) No manures of any kind are desirable, until there are fruits swelling on the plants. (3) Once in three weeks. (4) About 1 ounce. (5) One teaspoonful.

BEETLE: C. W. Strickland. We have not been able to identify the beetle found feeding on Dendrobium, and shall be glad to see more examples. R. McL.

BOOKS: T. H. The books you mention are long since out of print. They might be had at some second-hand booksellers, or by advertisement. The *Botanic Garden* is still of use, by reason of its illustrations, which, though small, are faithful. The other has now only historic value for the student. It is of little use for every-day work.

CARNATION SEEDLING: Hassock. But for a slight dulness in the colour (rose-pink) we should think highly of your seedling; form, substance, odour are good, and the calyx does not split.

CORRECTION: Temple Show report, p. 656, for Prescott, read Prewitt.

GRAFTS AND BUDS OF FRUIT TREES: W. F. Provided the grafts and buds are sound, and the stocks on which they are worked vigorous, the age of the trees from which the former are taken is of no consequence. The notion that if the parent tree should die, the grafted or budded stocks will die also, is a superstitious belief with no foundation in fact.

GOOSEBERRIES DISEASED: A. G. The Gooseberry bushes are affected with the common Cluster-cup—called *Aecidium grossulariae*. It is always more or less present, but seldom in sufficient quantity to be really a pest. It was figured many years ago in *Greville's Scottish Cryptogamic Flora*, and in the *Gardeners' Chronicle*, vol. xvi., 1881, p. 77. Being an endophytic fungus, which is perennial in the tissues of the affected plant we do not imagine that external applications of fungicides can do much service. Coudy's Fluid has been recommended in similar cases. Every leaf burnt lessens the chances of future disease. M. C. C.

MYOSOTIS PRINCESS VICTORIA: A. Rhodes. Apparently a form of *Myosotis alpestris*; very beautiful, rich in colour, free-flowering, and decidedly sweet-scented. We think it a great acquisition. Does it come true from seed?

FIG. 115.—WOOLLY OAK GALL INSECT: CYNIPS QUERCUS RAMULI.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—F. M. 1, *Sorbus domestica*; 2, *Lonicera Ledebouri*; 3, *Ribes aureum*; 4, a species of *Ribes*, probably, *sanguinea*. Send when in flower.—T. F. Orchid not recognised. Can you send a rough sketch of the plant, with size, and state the native country? R. A. R.—J. H.. *Dawlish*. 1, *Acer tataricum*; 2, *Cotoneaster bacillaris*; 3, *Aesculus flava*; 4, *Berberis aristata*; 5, *Acer campestre*; 6, *Acer tataricum*; 7, *Fraxinus Ornus*; 8, *Eriobotrya japonica*.—F. S. *Styrax officinalis*.—J. W. 1, 2, 3, All forms of *Pyrus Aria*; 4, *Styrax officinalis*; 5, *Pyrus terminalis*, wild Service; 6, *Tsuga Sieboldi*.—E. M. *Magnolia tripetala*.—E. C. C. D. Specimen quite withered, most likely it is *Cardamine amara*.—A. H. B. Your flower is of that form of *Laelia purpurata* named by Reichenbach *L. Wyattiana*, but which growers call a very poor variety of *L. purpurata*, although it is pretty enough.—Norvic. 1, *Pyrus terminalis*, wild Service; 2, *Acer campestre*; 3, *Viburnum Opulus*; 4, *Pyrus (Sorbus) domestica*; 5, no flowers, apparently *Sophora japonica*; 6, perhaps *Virgilia lutea*.—A. B. D. A fine form of *Ceanothus azureus*.—B. S. A. The flowering Ash, *Fraxinus Ornus*.—A. W. Your very pretty variety of *Cattleya Mossie* is near to C. M. *Arnoldiana*. It is not the one you indicate.—*Crotos*. 1, *Croton chrysophyllus*; 2, C. *Aigburthensis*; 3, C. *Queen Victoria*; 4, C. *longifolius*; 5, C. *Johannis*.—J. M. 1, ?; 2, *Philadelphus coronarius*; 3, *Anthriscus vulgaris*; 4, ? Why send such miserable scraps?—J. P. S. *Viburnum plicatum*.

NITRATE OF SODA, POTASH, &c.: H. Balshaw. These substances, mixed together in equal quantities, may be strewn on the soil in which the Tomatos, are grown at the rate of 1 oz. per square yard, or dissolved in water in the same ratio. It is perhaps better to strew them on the soil, as then their stimulating properties are carried to the roots at each successive watering. One application in three weeks is sufficiently often.

ODONTOGLOSSUM CITROSUM: C. L. Very good, but not unrivalled.

PEACH BLISTER: C. N. M. Too well known. It is the work of a fungus which finds the climatal conditions propitious. Early spraying with Bordeaux Mixture might be tried. It is too late now.

PREMATURE FALLING OF WALNUT LEAVES: L. C. There is nothing to be seen on the leaves which is suggestive of the cause. It is extremely likely that the circumstance is due to frost, or possibly to birds.

ROSES AND FLORIS' FLOWERS: W. Wadsworth. We cannot, as a rule, give the names of such flowers; they should be sent to some special grower. The saffron-coloured bud seems to be that of William Allen Richardson.

SOIL FOR FRUIT TREES: Marpit. The soil sent is chiefly marl, mixed with chalk. We know from experience that, provided it be well drained naturally, or by means of "grips" (open drains) or underground drains, consisting of coarsely-broken stone, brickbats, clinkers, and the like, covered with faggots or turf; pipes and tiles are unsuitable, owing to the roots of the trees clogging them, such laud will carry coniferous and hardwood trees, and produce marketable timber under proper conditions—why not, therefore, fruit trees? Manures rich in nitrogen, such as stable-manure where the bedding is not very frequently renewed, stall-fed oxen manure (not cows, which has but little goodness), together with nitrate of soda and potash will improve its fertility. It would be necessary to afford manorial dressings in alternate years till the trees and bushes come into bearing, after which time annual dressings would be needed, and these might sometimes consist of non-urinary soils, road scrapings, ditch clearings, &c. Do not plant before having trenched the laud 2½ to 3 spits deep, and well scuffle and stir the surface, and take some kind of catch crop the first season.

SPOTS ON GRAPES: Weathers. The appearance point mostly to mechanical injuries, from grape-scissors, &c. Kindly send a bunch in two or three weeks for further inspection.

STRAWBERRY DECAY: A. J. B. The berries were attacked by the common white mould soon after arrival, which partly obliterated the other fungus, so that it could not be recognised. However, you will be acting properly if you burn every affected berry. There is something in your treatment of the plants, in the house, or in the plants themselves, which favours the growth of the fungus. You can do nothing to arrest the progress of the mould once it has attacked a fruit.

TOMATOS: G. B. The fruits are all attacked by *Cladosporium lycopersici*, which begins with a blackish spot near the crown of the fruit. It has been rather common during the past few years, and we can offer no remedy, because the presence of the disease is not known until it makes its appearance on the fruit in ugly black spots, and then it is too late. We should advise you to cut off and burn all the diseased fruits, if you would save the rest. M. C. C.—G. T. The plants have no trace of organic disease, and we strongly suspect that the falling-off is connected with some external surroundings. We have seen similar results more than once from over-watering. Cultivators are more likely to err in giving Tomato plants too much water than too little. They will rot-off above the soil with an excess of water, just as your plants seem to be doing. M. C. C.

WOOLLY OAK-GALL: D. C. Through an inadvertence, in the pressure of last week occasioned by the Temple Show, we put in the wrong Gall insect illustration. Our present woodcut (fig. 115) is the correct one.

**JOHNSON'S GARDENERS' DICTIONARY.**

AN ENTIRELY NEW EDITION, thoroughly Revised and Considerably Enlarged by

C. H. WRIGHT, F.R.M.S., and D. DEWAR, Curator of the Glasgow Botanic Gardens. Complete in One Volume, Demy 8vo. cloth, 9s. nett.

NOTE.—The First Edition of this work was published in 1846, and at once became recognised as the standard authority on the subject, a position which it has retained ever since. It has passed through numerous editions, but has not been completely revised since 1863, though Supplements have twice been added since that date. For this edition the whole book has been carefully revised from beginning to end, with considerable additions, and has in all respects been brought up to the present state of Horticultural knowledge.

"It is without doubt one of the most reliable and important Gardening Dictionaries that has ever been published; in fact, as a dictionary and guide for gardeners, amateur or professional, its equal is not to be found in Horticultural literature." —*Horticultural Times.*

**FLORIST.**—Good hand. Could manage branch business.—H., 52, Ronalds Road, Highbury, N.

# GREEN'S PATENT "SILENS MESSOR" AND "NEW MONARCH" ROLLING AND COLLECTING MACHINES FOR 1896.

The Winners of every Highest Prize in all cases of competition, and the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by— They are the first, foremost, and best in the world.  
 HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,  
 HIS ROYAL HIGHNESS THE PRINCE OF WALES,  
 THE KING OF THE BELGIANS,  
 The Late EMPEROR OF THE FRENCH, The EMPEROR OF RUSSIA,  
 And most of the NOBILITY, CLERGY, and GENTRY of the United Kingdom.  
 The most excellent, as is proved by the fact of some of the Horse Lawn Mowers having been in use here for upwards of thirty years; but combined with good workmanship is the further important recommendation that they are of very light and easy draught.

The Queen's Head Gardener, Mr. OWEN THOMAS, writing from the Royal Gardens, Windsor, to Messrs. GREEN on January 17, 1894, says:—"I have pleasure in saying that both at Chatsworth and at the Royal Gardens my men have constantly had your Lawn Mowers in use for many years—Horse, Pony, and Hand power—and one of all of these Machines have done first-class work, and given every satisfaction. Not only is the workmanship and material in your Machines of the highest quality, but combined with good workmanship is the further important recommendation that they are of very light and easy draught."

Upwards of 220,000 of these Machines have been sold since they were first introduced in the year 1856. They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

**SINGLE-HANDED SILENS MESSOR LAWN MOWER, With Improved Steel Chains, Wheels, and Handles.**  
 To cut 8 in., can be worked by } £1 15 0  
 a Lady ... }  
 To cut 8 in., do. do. } 2 10 0  
 To cut 10 in., do. by a strong youth } 3 10 0  
 To cut 12 in., do. by a man ... } 4 10 0  
 To cut 14 in., do. do. ... } 5 10 0

We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.

### DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, can be worked by one man } £3 10 0  
 on even lawn ... }  
 To cut 18 inches, do. man and boy... } 7 10 0  
 To cut 20 inches, do. do. ... } 8 0 0  
 \* To cut 22 inches, can be worked by two men } £3 10 0  
 \* To cut 24 inches, do. do. ... } 9 0 0  
 \* If made stronger, suitable for Donkey, 30s. extra.

These Mowers are the "No Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.

Prices of Donkey, Pony, and Horse Machines, including Patent Self Delivery Box, or Side-delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

We have dispensed with the old-fashioned method of side delivery in these machines, so that they are thoroughly up to date.

### DONKEY AND PONY MACHINES.

To cut 28 inches ... .. £14 0 0  
 To cut 28 inches ... .. 16 0 0  
 To cut 30 inches ... .. 18 0 0  
 Leather Boots for Donkey ... .. 1 0 0  
 Leather Boots for Pony ... .. 1 4 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

### HORSE MACHINES.

To cut 30 inches ... .. £22 0 0  
 To cut 36 inches ... .. 26 0 0  
 To cut 42 inches ... .. 30 0 0  
 To cut 48 inches ... .. 34 0 0  
 Leather Boots for Horse ... .. 1 9 0

### GREEN'S PATENT LAWN TENNIS COURT MARKER (No. 2412).

The Best Marker made.

1st size, with 3 wheels, 14s.  
 Large size for Clubs and Large Grounds, price 17s.

Small Bag of Marking Composition, 9d.

### Green's Patent New Monarch LIGHT DRAUGHT LAWN MOWER.

It is superior to any Mower of this class yet brought out. Very suitable for Small Lawns and Banke.

**SALE SIZES AND PRICES.**  
 To Cut ... .. 8 10 12 14 16 inches.  
 Without Grass Box 30s. 35s. 40s. 50s. 60s. 70s. each.  
 Grass Box extra .. 5s. 5s. 5s. 6s. 6d. 6s. 6d. 6s. 6d. ,,  
 If fitted with a Long Handle for cutting banks, &c., 5s. extra.  
 No charge for packing-cases, except for shipment.

Carriage paid to all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

The largest stock of Mowers kept by any manufacturer is to be found at our London Establishment, SURREY WORKS, BLACKFRIARS ROAD, where Purchasers can make selection out of several hundred Machines of Hand, Pony, and Horse Power, and have their Orders supplied the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, Free of Cost to the Purchaser.

N.B.—Those who have Lawn Mowers which need repairing should send them either through their Ironmonger or Seedsman to our Leeds or London Establishment, or direct to us, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

GARDEN SEATS AND CHAIRS, AND HORTICULTURAL IMPLEMENTS OF EVERY DESCRIPTION, WIRE NETTING, &c., &c. Descriptive Illustrated PRICE LISTS Free on application to

**THOMAS GREEN & SON, LIMITED, SMITHFIELD IRONWORKS, LEEDS; AND SURREY WORKS, BLACKFRIARS ROAD, LONDON;** or they can also be had of any respectable Ironmonger, Seedsman, Merchant, or Factor in the United Kingdom.

### GREEN'S PATENT Ordinary IRON and WATER-BALLAST ROLLERS

FOR  
 Lawns, Drives,  
 Bowling Greens,  
 Cricket Fields, and  
 Gravel Paths.

	wt. qr. lb.	Diam.	Length.	Reduced Prices
PRICES OF	2 1 0	16 in.	by 17 in.	£2 5 0
	3 0 0	20 in.	22 in.	3 0 0
	5 2 0	24 in.	26 in.	4 5 0
	6 2 0	28 in.	28 in.	5 10 0
HAND ROLLERS.	8 2 0	30 in.	32 in.	7 5 0

### GREEN'S IMPROVED WATER & SAND BALLAST ROLLERS.

IN TWO PARTS.

They can have the weight regulated to suit the requirements of the ground, and also have it increased up to 45% on the empty weight of the Rollers.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in Great Britain.

	Weight—wt. qr. lb.	Diam.	Length.	Reduced Prices
PRICES, INCLUD- ING FUNNEL.	2 1 14	18 in.	by 17 in.	£3 0 0
	3 1 0	20 in.	22 in.	4 0 0
	5 2 0	24 in.	26 in.	5 5 0
	6 2 0	28 in.	28 in.	7 0 0
	8 2 0	32 in.	33 in.	9 5 0

These Rollers possess many advantages over all others; they are made in two parts, and are free in revolving on the axis, which affords greater facility for turning, and the outer edges are rounded off or turned inwards, so that the unsightly mark left by other Rollers is avoided. They are manufactured of the best materials, bored true in the lathe, turned on the inner edges fitted on polished shaft, and are put up in a manner surpassing any hitherto brought out.

### GREEN'S IMPROVED PATENT GRASS EDGE CLIPPER. THE "HANDY."

The work it does is clean, neat, and effective, and we have every confidence in recommending this useful "Handy" implement.

It is fitted with long handle, works steadily and with ease.

Price, 30s.

**STANDEN'S MANURE.**

ESTABLISHED OVER 30 YEARS.

Exceeds all others in General Fertilising Properties and Staying Powers.

It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell. The highly-fertilising properties of this Manure render its money value, in comparison with other Manures, at least double; and users will find that very small quantities will produce favourable and lasting results.

generally grown. Catalogue free on application.

**W. & J. BIRKENHEAD, F.R.H.S.,  
FERN NURSERIES, SALE, near MANCHESTER.**

MUNGO CHAPMAN, late of Easter Dnd-  
dington Lodge, Mid-Lothian, begs to intimate to his  
friends and acquaintances that he retires from his present  
situation on the 20th of the present month. He has arranged  
to reside at St. Ninians, near Stirling, where he intends to  
commence the Cultivation and Sale of Hardy Plants on his  
own account.

With the experience gained during twenty-four years in the  
management of one of the most choice private collections of  
plants to be found in the British Isles—that of the late Charles  
Jenner, Esq.—Mr. Chapman can confidently undertake to  
supply what is select and true to name of the most suitable  
plants for Borders and Rock-work.

He hopes to be able soon to issue a Plant Catalogue, from  
which customers may make their own selection. In the  
interval, he will be fully employed in getting up Stock.  
May 19, 1896.

**FOREST UTILISATION.**

MR. FISHER'S translation of Gayer's *Forst-  
benutzung* forms vol. v. of Dr. Schlich's  
*Manual of Forestry* (Bradbury, Agnow, & Co.,  
Ltd., Whitefriars). In German forestry-litera-  
ture few works are better known and ap-  
preciated than this, and we have little hesitation  
in predicting that the English edition will, in  
course of time, become equally popular where-  
over the English language is read and spoken.

The book consists of three main parts, the  
first of which deals with the properties of  
timber, its use in various industries, and its  
felling and removal from the forest. This part  
might be appropriately divided into two sec-  
tions, as chapters I. and II. have little connec-  
tion with those following. Under the head of  
"Technical properties and qualities of wood,"  
a short account of the anatomy of timber is  
given, followed by a comprehensive review of  
the various factors which determine the strength,  
durability, and technical value of timber gene-  
rally. The influence of the breadth and struc-  
ture of the annual ring, and the relative breadth  
of the summer zone, or the weight and quality of  
the timber, is discussed in a general way. The  
statement that narrow rings in coniferous  
timber usually imply heavier wood than broad  
rings, depends for its correctness upon what is  
meant by "narrow" and "broad." Schwappach  
found that the heaviest wood in twenty-four  
Scots Pine from various plantations showed a  
ring-breadth of about 1½ mm., while wood  
formed after the 150th year from very narrow  
rings had a low specific weight. On the other  
hand, much of the Swedish red-wood so highly  
appreciated for building purposes has extremely  
fine rings, in which the autumn or summer zone  
is poorly developed. These facts tend to prove  
that the architect and builder value clean growth  
and uniformity of texture higher than specific  
gravity, although for many purposes the latter  
may be of greater importance than the former.  
The various defects in timber due to frost and  
heart-shake, dead branches, wounds, and disease  
are described and explained, and remarks on  
the seasoning and period of felling timber deserve  
close attention from the practical forester.  
Two beautiful plates, and a number of useful  
data on the physical properties of timbers, will  
also be found in this chapter.

Chapter II. gives a comprehensive summary  
of the numerous industrial uses of wood in ship  
and house-building, joiner's, wheelwright's,  
and cooper's work, and many other minor  
industries in which wood forms the raw article.  
The description of foresters' tools and felling

timber is chiefly of value in showing the numerous methods adopted in different parts of Central Europe. So far as tools and the use of them go, the English and Americans are probably as far ahead as any European nation. The sections on forest tramways, timber slides, floating and rafting timber, are carefully written and fully illustrated, and the detailed description of these operations and appliances should be of great service to the Colonial forester and engineer. Curiously enough, the method of clearing timber off boggy land, or out of deep ravines by means of an engine and a steel rope is not mentioned, although its adoption in this country has given the best results. The general principles involved in the sale and disposal of timber are pretty fully discussed, and a good word is said for that much-abused person, the middleman, in the shape of the timber-merchant. Few will question the truth of the following paragraph (p. 468):—"In order to sell wood profitably, a forester must be a trader, and must have the same aptitude for trade as other dealers who sell wares." This practically sums up the whole question of timber selling.

In Part II. the minor products of the forest are dealt with. Amongst these we find Oak-bark, and methods of barking described. Gayer's opinion that barking impairs the quality of the timber may be correct, but it must be remembered that timber merchants do not generally distinguish, so far as prices go, between barked and unbarked Oak, while barking facilitates measuring and carriage, and better enables an opinion to be formed of the quality of the timber. When near a tannery, a small profit can also be made on the bark itself, and so long as this is the case, it pays the owner to bark his trees. Forest pasture and combinations of field crops with forestry are fully dealt with, although the latter practice is unknown in this country.

Chapter IV. of this part contains some useful information on harvesting and storing the seeds of trees, although it is not quite clear why Sycamore seed should remain for two winters in the trenches, as directed here. The chapter on forest-litter has a decidedly sylvicultural bearing, and although the subject is one which chiefly concerns those countries in which forest rights still exist, the principles involved are applicable to any forest managed on economic lines. In this country the woods are not deprived of their litter to any great extent by human agency, but the wind is allowed to sweep through many exposed plantations unchecked by soil-protecting growth. Interesting accounts of resin-tapping and the antiseptic treatment of timbers are given, the latter being a subject of increasing importance as the more durable woods become scarcer, and substitutes have to be found. Forest saw-mills; charcoal-burning, utilisation of peat, the cleaning of coniferous seeds, and extraction of turpentine and resin are finally treated of. The book contains upwards of 300 excellent illustrations, which add considerably to its interest. From the comprehensive nature of this volume, it may be inferred that it is by no means intended for the forester alone, but is of equal interest to the wood-consumer as to the wood-producer; and the builder, architect, and engineer will find much that concerns their callings in its pages. Many of the subjects dealt with have naturally but little reference to British forestry, but in our Colonies and Dependencies, as well as in the American States, this book should be invaluable. The wasteful method of working natural forests throughout the world cannot be justified in face of a possible scarcity of timber, and if persisted in, serious consequences are inevitable. Such a book as this, falling into the hands of thoughtful and influential colonists, may go far towards forming an intelligent public opinion on the forestry question, for it is evident that a nation must first realise the value of an article before it will go to the expense of protecting or producing it. A. C. F.

## NEW OR NOTEWORTHY PLANTS.

### CYTISUS × KEWENSIS (*new hybr.*)

WE already possess in *Cytisus* × *præcox* a hybrid Broom, the beauty of which has obtained for it a place amongst the most valued of all hardy shrubs. It would be assuming too much to predict a like future for this new comer, yet it is quite distinct from any other *Cytisus*, and possesses, too, very considerable attractions. It was raised at Kew four or five years ago from *C. Ardeini* ♀ by *C. alba* ♂. This year it has flowered so well, and its distinct character has been seen so plainly, that it seems desirable to put its origin on record.

It has a perfectly prostrate habit, and during early May bears long sprays (12 to 15 inches long) of thickly crowded flowers. The leaves are trifoliolate and together with the petioles and young wood are covered with a short, soft pubescence. The flowers are creamy-white, and fragrant, the large, cordate, standard petal being  $\frac{3}{4}$  inch high. Whilst the habit is that of *C. Ardeini*, the wood more nearly resembles that of *C. albus*. The colour of the flowers is almost intermediate between the parents, and is very like that of *C. præcox*; indeed, the plant might easily be taken for a prostrate form of that hybrid. For the rockery, or for forming a close compact covering to the ground, it is a distinct acquisition. W. J. Bean, Kew.

## TREES AND SHRUBS.

### THE DWARF JAPANESE THUJA (*THUJA DOLABRATA NANA*).

THIS is a slow-growing, miniature bush, with comparatively small light green foliage, more resembling a Lycopod than a Conifer. The average height of a large number of old specimens that I examined was only about 20 inches, while the spread of the branches was nearly 3 feet. All are remarkable for their tidy and uniform habit of growth, forming dense, compact specimens, yet not stiffly so, as is the case with many pigmy Conifers. The affinity between the species and this variety is readily recognised, but the foliage of the latter is altogether thinner, and more flaccid, and of a much lighter and more silvery-green than that of the parent. It is a useful shrub for the rock-work or confined border, and the silvery-tinted foliage makes the plant remarkable and pleasing. A. D. Webster.

### CYTISUS ARDOINI.

This rare species was discovered in the mountains near Mentone in 1847, but its introduction to cultivation took place twenty years later, when it was again found on Mount Cima d'Ours (also near Mentone). It is of prostrate habit, and has small, pubescent, trifoliolate leaves. It is a very free-flowering plant, and its blossoms are bright golden-yellow. Moggridge figured it in his *Flora of Mentone*. Its rarity (said to be due to the continual cropping of its foliage by animals, and the consequent absence of seeds), has hitherto prevented it from becoming well known, but its admirable adaptability for the rock-garden has been well shown by a tuft that has flowered in the Rockery at Kew this spring.

### ERINACEA FUNOENS.

A plant of this extremely pretty and interesting shrub has recently flowered at Kew. It is a dwarf, very spiny Leguminous bush, rarely as much as 1 foot in height, and destitute of leaves except on the young branches. Although one of the very rarest of its class, it has been known in this country more than 250 years, being described and figured in the 1633 edition of Gerard's *Herbal*, as *Genista spinosa humilis*. The flowers (which this season have been so abundant as to almost hide the branches) are of a beautiful purplish-blue—a colour very welcome among the hardy shrubby Leguminosæ. The species appears to have been originally discovered by Clusius on the mountains of Spain. It has since been found in the Mount Atlas region. The name *Erinacea* is derived

from *Erizo*—the common name of the hedgehog in the locality where it was originally found. It is apparently fairly abundant in some places, as it is said to be quite a hindrance to travellers, on account (as Gerard puts it) of its "plentiful store of green prickles." The plant has stood out-of-doors at Kew during the past winter without protection, but that was not a severe test as to hardiness. In the older publications, it is spoken of as needing protection in winter. Canon Ellacombe grows it at Bitten, and it would be useful to know from him what degree of cold it will stand. In any case, it is a shrub well worth looking after.

### ROSA HISPIDA.

This Rose is evidently a near ally of the Scotch Rose (*R. spinosissima*), but its origin is doubtful. It was formerly known as the Yellow American Rose, and Pursh, describing it as *R. lutescens*, included it in his *North American Flora*. This was erroneous, and in the *Botanical Magazine*, t. 1570, it is suggested that it is a native of Siberia, probably because of its similarity to the variety of *R. spinosissima* (*altaica*) that is native of the Altai Mountains. Now, however, it is believed to be of garden origin, and the fact that there are no wild specimens in the Kew Herbarium, although there are several from gardens, seems to support this view. It is an old garden Rose, although now uncommon, and records of its being cultivated as far back as 1781 exist. It has erect stems from 4 to 5 feet high, thickly covered with slender bristles, the leaves being glabrous, and consisting of seven to eleven leaflets. The flowers are single, and measure 2½ inches across, the colour being a charming shade of soft creamy-yellow. During the past week or two the plant has flowered in the collection of wild Roses at Kew. W. J. B.

## METHODS OF PROPAGATION.

(Continued from p. 673.)

THE HAWTHORN.—The common variety of the Hawthorn is deservedly popular as a flowering tree in our parks and paddocks, but where any of the varieties that produce coloured flowers have been planted, a much greater effect is created. A friend of mine used to have his hedges grafted with the single Scarlet Thorn and Paul's variety, and very handsome they looked until the railway, and with it the ubiquitous excursionist, came. To find red May in the hedgerows was to them a novel experience, and when the Cockney crows had passed, the poor hedge was a wreck. Thorns should be grafted early, either low down or at standard height. *Crataegus oxyacantha*, *punicæ plena* (*C. o. rosea superba*), the double white, the single scarlet, and Gumpier's bicolor, are the finest coloured forms, while one called *Neapolitana* in some nurseries, having large trusses of white flowers and good foliage, though later than the common Hawthorn to flower, makes a handsome park-tree. For fruits only the best are *ariæfolia*, *macrocarpa*, and such very large fruiting kinds included by Loudon under a sub-genus *Aronia*, and the Tansy-foliaged Thorn, these being distinct and desirable. Other popular kinds are the Cock's-spur and the Glastenbury, the latter said to flower on Christmas Day; but I have never seen it, maybe because my nursery trees were too young. Before dismissing this most useful and interesting bush, let me call attention to Carrière's fine *Aronia*, a new and very unique variety among Thorns (see *Gardeners' Chronicle*, p. 737, Dec. 22, 1888). The tree is vigorous, with large dark-green foliage, which is very persistent. The flowers are large, pure white, changing to rose as they fade, and followed by fruit as large as the common Medlar, but scarlet. These fruits are edible, and have the flavour of a very ripe Apple. A most desirable kind for all gardens of any pretension.

### THE FLOWERING ASH.

A somewhat neglected tree is the *Ornus*, or flowering Ash. If scions can be procured of this, it may be worked freely on the common Ash, and will flower more abundantly than upon its own roots. It is known both as *Fraxinus Ornus* and *Ornus europæa*.

The small flowers are borne upon erect terminal spikes, and are agreeably fragrant. Of other kinds of Ash it is desirable to propagate by other means than seeds are the weeping form, to grow into a natural arbour; and the Aucuba-leaved Ash, the large foliage of which is maculated with bright golden spots, and if you can procure scions, work a few trees of *Ornus Mariesii*. This will produce pure white, very fragrant flowers in May and June, and is a very suitable tree for a lawn.

#### THE OSMANTHUS.

Mr. J. G. Veitch sent from Japan some extremely pretty shrubs, called *Osmanthus*, allied to *Olea*. They may be grafted on the *Ligustrum* or *Privet*, but my experience is that they had better be worked indoors. The variegated kinds make very pretty shrubs, and when in flower they fill the air with grateful fragrance. If grafted 1½ to 2 feet from the ground, they form nice heads, and then are most useful to lend variety to the plants in cool houses or winter gardens.

#### THE LIMES AND ELMS.

There are many fine Limes, but by far the most useful is Parmentier's large-foliated kind, which makes a lovely cool shade creating weeping tree, while the foliage being silvery beneath is very attractive during a gentle breeze; this is grafted on the yellow-twigged Lime. While writing of weeping-habited trees, I must not forget the Elms. Among these the best are *Ulmus campestris pendula*, and a large foliated kind called the Parasol Elm. All may be grafted on the *Wych Elm*, but the *Huntingdon* is a cleaner and more vigorous stock. Some good and useful plants may have been omitted from the foregoing notes, but will most likely be dealt with under the heading of inarching or budding. *Experience*.

### SMYRNA AND NEIGHBOURHOOD.

(Continued from p. 670.)

Of Tulips the name is legion, and it was my good fortune to come across a bed of *T. undulatifolia* on one of the hills; the brilliant and large scarlet flowers and frilled leafage covered an area of some 20 or 30 yards square, and formed a beautiful sight. This family is represented in Mr. Whittall's collection by *T. orphanidea*, primrose-coloured; *T. Biebersteiniana*, very dwarf, bright yellow, more like an *Ornithogalum* than a Tulip; *T. montana*, bright red, with leaves curved, like ram's-horns; *T. Haageri*, brick-red, but varying much; *T. sylvestris*, yellow, tinged with brown inside; *T. bythinica*, a little gem, dwarf, lilac-red—of this there is another form, bright magenta and yellow bars; *T. ciliatula*, bright red and brownish-red, two varieties; *T. (?)*, unnamed as yet, very fine, bright orange colour; *T. australis (?)*, rather dwarf, bright yellow, so named at Kew, but apparently open to query; *T. Clusiana*, pinkish-white, with recurved leaves; *T. præcox*, so named apparently on the *lucus a non lucendo* principle, being one of the latest bloomers, very large, 1½ foot high. There are two varieties, one pink and one red, with white central line; Mr. Whittall regards this as a new form, and misnamed. Another form, smaller, and brownish-red, figures also as *T. præcox*; *T. Sprengeri*, narrow leaves, dark crimson; *T. (?)*, very like *T. Elwesii*, pink with yellow centre, and blunt ovoid petals, very distinct indeed.

The Scillas are mainly represented by forms of *S. bifolia*, which ranged from Constantinople down to the Taurus mountains, and varies much in size and colour. White and pink forms occur as well as the normal blue. *S. b. Whittallii* is very distinct and pretty, the petals being very slender, almost filamentous when dried—the normal form grows 9 or 10 inches high, and is very floriferous; *S. b. taurica* is beautiful and distinct. This embraces two varieties, one with filamentous blooms *à la Whittallii*, the other with wider petals. Its distinctive character, however, is that the flowers form a compact conical head on an erect stalk. *S. autumnalis* is a very small-flowered species, blooming in September, the small *Myosotis*-like clusters appearing before the foliage.

Crocus appears in innumerable varieties, but so far no classification has been made. *Colchicum*, however, has received more attention, and is represented by *C. Szowitzii*, dwarf, pink, early spring; *C. montanum* varies much, and each bulb yields numerous flowers; *C. autumnale* is also in great variety—there is a fine variegated form, coloured *à la Fritillaria*, in check pattern; *C. Parkiusoni*, very large and handsome, lilac and white, also checked; *C. lactum* is a very handsome, quite a gem; it is pure white, and the flowers are numerous. Mr. Whittall received this last unwittingly, and shortly after was delighted to find the bulbs in full bloom in his study in the bag they arrived in, a fair augury for easy culture.

*Sterobergia* is represented by *S. lutea*, a yellow form; *S. macrantha*, a grand canary-yellow variety, and distinctly beautiful; *S. Fisheri*, which produces its leaves first and in the spring, it is very like *macrantha*, but has flowers like *lutea*, and shorter stems, the bulb is rather smaller.

*Fritillaria* affords endless varieties, of which some thirty are found in this collection. *F. dasyphylla* appears as a small form, with bright yellow, brownish-red, or very dark red flowers; another is red with yellow stripes inside. *F. d. amalyriou* is very fine; the flowers are brownish-red, striped yellow. *F. Pinardi* is very tall, and the flowers small, brownish-red. *F. Whittallii* is lilac-red, mottled with lighter lilac; very fine, but varies much. *F. citrina* is greenish-yellow. *F. Elwesii* is very fine, and grows 15 inches high; green flowers, very large, with dark crimson tips. *F. aurea*, very large, yellow, spotted brown. *F. meleagris* also occurs.

This completes my notes on first visit, and gives, I think, a fair idea of the general abundance of spring bulbs, for which this usually arid country must be specially adapted. So far I have been struck by an absence of the *Sedum* and *Saxifraga* family, in situations seemingly well adapted for them; but as I start to-morrow for the hilly region, 60 or 70 miles south of this, I may find cause to alter my opinion as to the scarcity of these, and also of Ferns, and may possibly send you a few more notes on my return. *Chas. T. Drury*.

### ORCHID NOTES AND GLEANINGS.

#### DENDROBIUM PARISHI.

IN the collection of H. GREENWOOD, Esq., Highfield, Haslingden (gr., Mr. Spur), are some well-grown and remarkably well-flowered plants of *Dendrobium Parishii*, on one of which I counted forty pseudo-bulbs with numerous leads and eighteen flowers; another plant had more than eighty flowers. At this season, when *Dendrobiums* are on the wane, this is a most useful species. The flowers on different plants vary in colour, in some of them the segments are of purplish-rose, and in others of a shining mauve. The labellum is remarkable from its multitudinous hairs both in the deep crimson blotch towards base of column and the light mauve coloured lower division. The plants were rested for two months in the winter in a house with a minimum temperature of 45°, and they are now flowering in an intermediate house. It is so seldom good plants of this desirable *Dendrobium* are remarked in collections, that Mr. Greenwood's plants are worth making a note of.

#### DENDROBIUM CARINIFERUM, HIGHFIELD HOUSE VAR.

This is a very superior form of *D. cariniferum*. The flowers are much larger and brighter than in the type, and their greater substance is so pronounced as to make the variety a very valuable one. The sepals are ovate-acuminate, whitish, but the acuminate points are citron-coloured. The petals are purely ovate, and lustrous white. The labellum has very prominent lobes, with a blending of cinnamon and orange colour. There are a few distinct raised hairy cinnamon ridges on a whitish ground, the white margining the lower lobe of the lip. It is altogether a beautiful variety, and the flowers smell like fruit of

the Tangierine Orange. The long, hooked, yellow-shafted spur of the sepals gives the flowers a striking outline. Mr. Greenwood was fortunate to secure this fine variety at one of the sales, and it is a plant of some size, having twenty of its shortish fat pseudo-bulbs after the way of *D. formosum giganteum*, but much plumper and shorter. The plant is flowering in a moderately cool house. *J. A.*

### BERLIN.

#### HORTICULTURE AT THE BERLIN INDUSTRIAL EXHIBITION.

WHENEVER horticultural exhibitions have previously been held at Berlin, it has been noted that two sections of horticulture—landscape gardening and tree cultivation—have not been seen at their best. The reason for this has been that all the exhibitions were held in localities which had, in addition to a more or less large covered space, but a small amount of available open ground. So it was of the highest importance that this year, on the occasion of the Berlin Industrial Exhibition, the above-mentioned sections of horticulture should have allotted to them a large area, where they could be extended more fully. Landscape gardening, as well as tree-planting, are here of high importance. Landscape gardeners of well-known reputation, such as the late Leenó and the late Meyer, have worked here for a long time, and the number of their pupils is not small. They have laid out in the neighbourhood of Berlin and Potsdam so many delightful parks, such famous vistas, that to speak of them would be to bring owls to Athens. Also, the large park at Treptow, wherein the industrial exhibition this year is held, is the work of the late Director Meyer. On the other hand, it is well known that the largest tree-nursery on the Continent, that of Mr. Spaeth, is near Berlin, and a good many other large nurseries are also here. So it is, that this year the horticultural exhibition is largely devoted to these two branches of horticulture. This by no means implies that other branches of horticulture are neglected. Fortunately, indeed, was it that both the landscape gardeners and nurserymen had long notice before the opening of the exhibition, so that their arrangements might present more or less the appearance of well-established gardens; indeed, the first plantations were begun as early as the autumn of 1894. So the plants had time enough to grow well during last year, and have now overcome these early drawbacks, which are never wanting. Another favourable circumstance is, that the exhibition is held in a park; so that there are already a good many large old trees which help to make a good appearance. The landscape-gardeners had good standard trees, of which they could have made the best use. Curiously enough, they have done this only in a very moderate degree. The largest plantation is that from Mr. Spaeth. It has an area of 10,000 sq. mètres. According to the different branches of this undertaking, the exhibition includes an orchard of 2500 sq. mètres, a large Rose garden, a delightful pleasure-ground, and, to give the public an idea of Conifer culture, a little garden, wherein different Conifers are grown, from one-year seedlings or cuttings, up to six-year-old plants. The orchard contains about 1000 fruit trees, amongst these 100 pyramids, 250 vertical cordons, which form a delightful pergola of Pear-trees, 350 mètres horizontal cordons, and 1000 square mètres of wall fruit trees. In form the orchard is a trapezium, whose divergent and small sides are formed by the wall-fruit trees, especially Peaches and Apricots. In front of these rises a bed, which is bordered by horizontal cordons of Apples. The axis between the two unequal sides is formed by the above-mentioned pergola, and widens in the centre to an open octagonal bower. On both sides of this pergola run small beds, also bordered by horizontal cordons of Apples. Between these beds and those at the divergent sides of the orchard, two larger beds on each side are destined for pyramids of Apples, Pears, and Cherries, whilst one on each side, viz., at the long side of the trapeze, are planted with Goose-

berry-trees and Currants, and bordered by Strawberries Laxton's Noble and King Albert. The trees and shrubs were planted in the autumn of 1894. Now they are well-established; they have flowered very well this spring, and it is to be hoped that they will bear much fruit.

The trees are of good habit. Before and behind this Orchard are situated pleasure-grounds, of which the larger one in front of the long side of the trapezoid orchard, a semi-circle, is destined for 700 different Conifers, whilst the lesser one, rectangular, behind the short side of the orchard, contains, where it abuts upon orchard, high and moderate-sized fruit-trees, small Palms, &c., then ornamental shrubs and trees; amongst these very fine collections of drooping trees, the so-called pendulous varieties, and plants with variegated leaves. Mr. Spæth has selected from his collection of more than 6000 different species and varieties of trees and shrubs only the best and rarest, so that this exhibit has a special interest both for amateurs and botanists. Mr. Spæth's collectors have sent home a good many rare plants. I will mention one only, *Prunus Lauro-cerasus* var. *Schipkaensis*, of which there are two forms, a broad and a small-leaved one. Both are evergreen, and resisted without any protection 24° R. below zero (= 22° F. below freezing-point). Certainly this is a horticultural acquisition of the highest value. Next to the orchard in the middle of the semi-circular pleasure-ground is a large fan-shaped carpet-bed, planted with Noisettes Roses, such as *Hermosa* and *Fellenberg*. On both sides run from thence broad ribands, also planted with these Roses. These, together with the delightful Conifers, give a very fine artistic effect. To the right of the path, which runs around the semi-circle, and next to the orchard, lies the large rosary, containing about 8000 plants. The plants are distributed upon beds of various forms, and are partly standards, and partly root-grafted. Very interesting are two round beds planted, one with *La France* the other with *Captain Christy*, both pegged down so that they cover the whole soil. From a pavilion there is a delightful view over the rosary, with a fine background of Conifers. The rosary is bounded by large foliage trees and shrubs, amongst which a large grove of flowering Magnolias made a fine effect on the opening day. Opposite to the rosary stands a little Swedish pavilion somewhat raised. Around this are planted out another speciality of Mr. Spæth, *Cactaceæ* from Colorado. It is well known that some species of *Opuntia*, such as *O. camacanica*, *Rafinesqui* and *fragilis* grow here at Berlin in the open air without any protection, and flower well and fruit. The temperature falls here sometimes to -22° F. Mr. Spæth's collector, Mr. Purpus, found, at high elevations in Colorado, certain other *Cactaceæ*, which are as hardy as the above mentioned *Opuntias*, but, and this is interesting, amongst these were not only some hitherto undescribed species of *Opuntia*, but also two *Mammillaria* (*Purpusii* and *Spæthiana*), one *Echinococcus* (*phoeniceus*) and an *Echinocactus* (*glaucus*). All these species have been proved to be quite hardy here. From the Swedish pavilion the above-mentioned little nursery garden extends, wherein, in forty beds of some 5 square metres each, young Conifers are grown from seeds and cuttings. Large avenue-trees are planted along the sides of this path, whilst climbing shrubs of different species are planted in the neighbourhood. *U. D.*

## COLONIAL NOTES.

### BOTANIC STATION, LAGOS.

Ma. H. MILLEN, Curator of the Botanic Station, Lagos, is to be congratulated upon the publication of the Thirty-second Quarterly Report of these gardens. Drought, insect, and other invading foes are among the difficulties successfully contended with during the last season, these being in addition to the ordinary routine work of the Station. Mr. Millen has, for some time past, been making experiments as regards the cultivation of *Rafia*, and samples of the fibre have, from time to time, been

sent by him to Kew to be examined and reported upon. The verdicts upon them have been increasingly favourable, and afford reason to hope that some day the production of *Rafia* fibre will become an important industry at the Lagos Botanic Station.

## ARUNDINARIA NOBILIS.

Our illustration (p. 701), shows a plant of this species which was introduced to Menabilly in 1836. In or about 1872, as we learn from Mr. Rashleigh, it died, but the plant now shown was raised from seed of the original plant, and is growing in clumps 27 feet high, and with a spread of nearly 30 feet. It seems probable that it may have come from China. Mr. Mitford, unable to refer it to any described species, calls it *A. nobilis*. Close by the Bamboo is a *Fan Palm*, *Corypha australis* (?), which has been in its present position for twelve years. It is very distinct from *Chamærops Fortunei*.

## GRAPE CULTURE IN ITS COMMERCIAL ASPECT.\*

(Concluded from p. 618.)

WITH regard to the profitable life of a Vine, it may vary from ten to twenty years, according to the sort of borders that are made—i.e., houses built together with only inside borders will not carry the Vine through more than ten years profitably; whereas, where they can roam in well-made outside borders, their life and vigour are doubled. What I specially mean by outside borders is, not that the Vines should be planted outside, and introduced into the house through the wall, as was the old practice, but that the border should be both inside and out, the fronts of the houses resting on piers or arches. Then, by planting the Vines inside, a far better start is assured, and they will soon ramble outside, where the sun and air more naturally prepare a congenial place for them. And while speaking of borders, how various and contradictory even are the instructions given for making Vine-borders. I am afraid the market-grower does not consult the text-books much, but makes the best use of the material he has at hand, and adds to it in some cases, where the soil is very heavy, London manure for the sake of its mechanical effect, and bone-meal of high-grade quality. A commercial Vine-grower does not often use  $\frac{1}{2}$ -inch or larger bones, as a quicker return is possible than they give from the more immediately useable bone-meal. Moreover, cultivators do not so much rely on the depth and richness as upon frequent top-dressings, thus encouraging the roots near the surface.

The drainage of a border is very important, and it must be of such nature as not to allow stagnation, or so free as to permit the substance of the border to be too much drawn. A Vine during its growing season can hardly be afforded too much water, provided the drainage is good. How very often, in moving old Vines, the border which has received every attention is found to be almost devoid of roots, and they have been found far away roaming in the kitchen garden. The practice of the future will probably lean to more shallow borders—that is, not exceeding 2 feet 6 inches in depth.

There have scarcely ever been places established from their beginning depending upon the Vine alone, but nearly always other crops are grown in the houses until the Vines come into bearing, and at the present day Tomato-growing is the usual practice. The grower must, therefore, as well as raising his young Vines ready for the spring, arrange for having Tomato plants ready also. It is of the first moment that a variety of Tomato should be chosen that is good for market. It should be of hardy constitution, growing fruit not too large, running from four to six to a pound, as perfectly round a shape as possible, of good colour, and firm texture. But I must not dwell on the Tomato, but keep to our subject—the Vine.

If it were not possible to tide over the first two years while the Vines are growing the bearing wood,

with other crops in the houses, it would be much more difficult than it is to establish a vineyard under glass. The young Vines properly grown should be say about 2 feet high by the middle of May, and then is a good time to plant them in the border which has been prepared for them. At the time of planting, bonemeal is a good dressing to mix with the soil, and short manure should be used as a mulching on the top. They will require careful and constant little attentions until they throw out new roots, and abundance of clear water during the growing season through June, July, and August. By the end of August growth ought to be discouraged, and the Vine led mors to develop and ripen the wood already made.

When Vines are strong at planting time, and given liberal treatment through their first year, they sometimes grow 20 and even 25 feet long. Indeed, I have seen Vines cropped the first year after planting from the eyes, and bearing 10 lb. of fruit. But this is not wise where the establishment of permanent Vines is intended, as the loss of constitution can be noted in such Vines for years afterwards.

### EXTENSION OR RESTRICTION.

There is one aspect in Vine culture that requires carefully weighing from its commercial side, and that is the question of extension *v.* restriction. I am bound to say that the extension system of culture affords in the end by far the best results, and these are arrived at simply on account of the capabilities of Nature herself.

It is more rational, and predisposes to strength of constitution, but whether it is right from a mere commercial point of view is a different question. It is necessary to have a quick return, and a number of Vines planted from 2 feet to 3 feet apart will, the second season, produce all along the length of the house some Grapes; whereas, of course, when planted wide apart there will not be so much return for some years later. And that advantage in the restrictive system extends to the third and fourth years. By the fourth season, at any rate, the extension-treated Vine will be equal to the several Vines henceforward in producing powers, of stronger constitution, and much more likely to resist the ravages of red-spider and other foes.

How often it occurs to one that our mechanically-constructed houses impose restriction, even upon Vines treated under what is called the extension system. When a Vine attains the age of four years, it would easily, with benefit to its health and wealth, double itself in one season if the structure which covers it could be enlarged there and then. This presents an idea to the ingenious, which, if solved, would be of immense value to Vine-growers; but I am afraid it is outside the realms of practice, and we must own that man's mechanical arrangements limit the plain will of bountiful Nature.

Constitution, which embraces powers of assimilation, is the chief thing to strive for in cultivating the Vine, and this leads to the thought of fertilisers for the Vine. First get constitution, and then we may proceed to intense culture. The many artificially-compounded mixtures recommended as concentrated food for the Vine are mostly very well suited for it, and for some localities they may even be perfect; but where localities differ so much in the character of their soil and other conditions, to universally apply one formula of mixture would be adding equals to unequals, and so would be unscientific.

A grower of the Vine for profit must be careful to know the natural characteristics of his own locality, and endeavour to counteract any too predominant features, and to add to those that are deficient. The elements of manorial value are known facts, and do not vary by being distributed over areas; but localities of areas vary, and it is when proceeding on that foundation that the best commercial results are obtained by the application of potash, lime, or ammonia. One thing we have progressed in is our treatment of the Vine by presenting to it food nourishing and invigorating in quite appetising forms, widely different from the other grossly allopathic practice of burying dead horses in Vine borders.

\* Paper read by Mr. Peter Kay, Claugmar Vineyard, Finchley, at a meeting of the Horticultural Club on May 5.

After the first summer of the young Vines' growth and crop of Tomatoes, the borders will require special attention during the winter to enrich them, and also to provide room for the Vines the following season. The trellis will have to be put up, and should the houses not have been fully heated at the commencement of operations, then the boilers will have to be seen to, and pipes added, up to the necessary power for a viney. A Vine or fruit-grower for profit under glass requires to have the capability of turning his hand to many trades, for I can imagine, even under the

present day we are far from perfect, for with the very best boilers, more heat escapes than is captured for use.

The market grower generally, like all the brotherhood, has his pet ideas about boilers. But a market-grower is safer to follow as a rule, for necessity makes him less faddish, and he nearly always adopts a type of boiler as simple as possible, generally now-a-days taking the form of a longitudinal tubular of heavy cast-iron pipes put together on the premises. Where the length of piping to be heated is only, say,

into larger additions; but should the progression of increase be allowed to go beyond his financial management, then the concern will not give the best results.

It is difficult conscientiously to give a rosy aspect generally to the business of Grape-growing under the conditions as they are at present, and I cannot fairly estimate that in the future there is any likelihood of a rise in the prices of Grapes. There no doubt will be always good and, indeed, remunerative prices for the very best and special samples, but we all know that

FIG. 116.—GROUP OF BAMBOOS, ETC., IN THE GARDENS OF J. RASHLEIGH, ESQ., MENABILLY, CORNWALL. (SEE P. 700.)

best circumstances, that unless the necessary staff can be employed in boiler-setting, pipe-fixing, and glazing during the dull time, the unknown quantity of profit may be very small.

#### HEATING APPARATUS.

The mention of boilers opens up to the gardener and market gardener a vast subject of discussion. From our earliest days, we can remember the boiler controversies. Every gardener had, and the same thing prevails now, his favourite boiler. Boilers have been made of every conceivable form, and in every case the idea aimed at was the utmost extraction of heat from the fuel consumed before the draught necessary to burn it passed it up the chimney; and at

1000 feet, probably the old-fashioned cast-iron saddle is still the best, but beyond a size capable of heating that length of pipe, on account of contraction and expansion of the metal, they would be unsafe.

It seems to me that in establishing a vineyard under glass it is absolutely necessary that a system of progression should be set out, which allows a development of the producing powers keeping pace with the outlay; and with all favourable advantages on the grower's side it will be some few years before he has produce to send to market to show a living profit, beyond the necessary interest and the adjustment of his capital. When that time arrives, and a foundation is laid for making a yearly revenue with some amount of certainty, then the grower may launch out

such first-grade fruit is a small proportion of the great bulk sent to market. One thing is of comfort to me, and that is, that the Vine is not likely to be superseded by any invention or even discovery of man; from time immemorial its produce has been one of the chief bounties that can be won from Nature. The returns to growers may become less, and the true solution of the question of profit is, and must be, improved methods in production.

In Vine-growing, as in nearly all producing industries, it is now-a-days a disadvantage to have been established long, as the means employed are nearly always obsolete, and the traditions of the concern hamper new developments; hence my remark is proved, that unless the very serious fact of the

annual depreciation of a vineyard or other fruit-growing establishment is taken into account, it becomes of little value to sell or let when it has to compete with modern and better-equipped places.

#### MARKETING.

If the grower has passed through the first steps, and arrived at a stage of his venture when Grapes or any other produce that he has grown is ready for market, then comes in one of the most important items in a commercial Grape-growing place, and that is the taking or consigning the fruit to market, and the manner of packing with regard to grading, weighing, and carriage. Packing will have to depend largely on the method of carriage, whether by train or ordinary horse-vans. Time was when Grapes were actually carried on the men's heads all the way to market. By grading I mean the assortment of the fruit according to its quality, leaning always to the side of giving over the sample than even exact, or under; also in carefully putting on the package the net weight of fruit, and that not in too exactly just a manner, but leaning towards the purchaser's favour. I cannot too strongly impress on fruit growers to be most careful about the manner of sending produce to market, not only on account of honour, which makes the foundation of all success worth having, but in order to gain from the very first what is called in all the different markets of all sorts "a good mark." Then as the grower and producer, slowly it may be, builds up and jealously guards a character for his produce, so will his agent have less trouble and get better prices for the produce consigned.

In writing these few remarks on Grape-growing as a commercial industry, I have endeavoured to avoid many details of the question, and to treat it broadly. The question to me, and I well know to many who, because they have been born to it, or who have been led from circumstances to adopt it as an occupation, abounds in interest, and there are many points on which growers differ widely. The change that has come over the situation commercially in regard to most things is borne out in the case of Grape-growing, and in many instances the alterations have seriously affected the position of individual growers; still, the general welfare is better now, taking growers, sellers, and consumers all together. But the future, with regard to its successful commercial side, must be, first, with those whose natural position with regard to soil, water, and carriage is best; secondly, with those whose special training and experience give them immense advantage over the inexperienced; and really one has to sound a note of warning that Grape, or any fruit-growing, as a commercial undertaking, cannot wisely be entered on except by those who have practical experience.

There is plenty of elbow-room for all to grow good sound fruit, of whatever sort, to be consumed in this country, but it is another side to the question whether individuals who embark in the occupation without sufficient knowledge are to be rewarded by much profit.

It seems hard to say so, but it does appear that concerns are getting into fewer and fewer hands, that a harder system is gradually embracing all businesses, that the smaller capitalist by having to take less return on his outlay is more hardly pressed. Now Vine growing is an occupation that will ever depend on individual attention, and as soon as the thorough, thoughtful treatment is neglected, then we cannot expect magnificent results. But Commerce says, Does it pay? Can it be made to pay? and without considering art or skill, proceeds to reduce the production of Grapes to a system, and perhaps getting its 5 per cent., almost ruins the smaller man. That appears to be the course of our business in the near future, and because of the necessary management of large places getting away from a direct personal supervision, the results will often be not first-grade produce. Herein lies the hope, and I believe strength, of smaller places, as they can be more carefully and economically managed, with much more likelihood of growing high-grade produce.

There are many details relating to the establishing and management of a vineyard under glass that one

cannot refer to in a short paper that aims principally to give some general ideas only about the subject. The occupation of a Vine-grower is one of the most pleasant that can be undertaken; it is full of ever-changing interest. The grower can, from ordinary observation of the Vine, learn many lessons useful in life. There is a perfect organisation in the Vine itself; there is a fruitfulness that is stored the season before it is seen, and is "not to be traced by sight or sound." There is the ripening and the going to rest, and the miracle of coming into life again in the spring.

### RHODODENDRONS, NEW, AND OTHER.

RHODODENDRONS cultivated in the open air have been exceptional this year in floriferousness and beauty. A considerable number of new or obscure sorts have flowered and been brought into notice, and as some of these are horticulturally interesting, it is desirable that their history, so far as it can be ascertained, should be recorded.

*R. Falconeri* × *niveum*.—Flowers of this hybrid have been sent to Kew by several correspondents, including Mr. Lakes, of Trevarrick, St. Austell, Cornwall, who writes that he purchased his plant for *R. grande* (argenteum) from a Belgian nurseryman, about ten years ago. It was then 6 inches high; now it is 30 feet in circumference, and 8 feet high, and this season it has borne about thirty heads of flower. Its leaves are 6 inches by 2½ inches, thick and leathery, the midrib and principal nerves prominent, the upper surface dark green, the lower covered with a brown felt-like wool. The flower-head is dense, 6 inches in diameter, and is composed of about fifty flowers as large as the largest form of *R. Falconeri*, which they resemble in form, their colour being lilac-pink with a dark crimson blotch at the base of the corolla. *R. niveum* is quite hardy at Kew, and *R. Falconeri* will live in the open, but does not flower. Probably, this hybrid will be hardy at Kew, and in equally-favoured localities; it is a handsome addition to garden Rhododendrons. There is some resemblance between it and *R. Hodgsoni*, but the leaves in the latter are quite distinct.

*R. Luscombei* var. *splendens*.—The beautiful hybrid, described in *Gardeners' Chronicle*, 1892, xi., p. 780, under the name of *R. Luscombei*, was raised about 1880, by the late Mr. T. Luscombe, from *R. Fortunei* and *R. Thomsoni*. It has broadly campanulate rosy-red flowers, as large as those of *R. Fortunei*. A fine example of it has this year been a beautiful picture in the Rhododendron Dell, at Kew. A fortnight ago Mr. Godman sent, from his garden at Horsham, trusses of a Rhododendron which is identical in all characters with *R. Luscombei*, except in colour, which is exactly that of *R. Thomsoni*, viz., a rich blood-crimson. This has been named var. *splendens*. I consider it to be one of the most brilliant of the Fortunei hybrids yet raised.

*R. Mrs. W. T. Threlton-Dyer* (see fig. 118, p. 707).—When Mr. Luscombe crossed *R. Fortunei* with *R. Thomsoni*, he evidently made at the same time several other crosses between the former and other sorts. One of these is known at Kew as *R. Luscombei* H. Two other of his hybrids are now flowering at Kew for the first time. They are large bushes, a little sturdier in habit than *R. Fortunei*, but identical in foliage with that species. The trusses are more compact, and the flowers are nearly 4 inches across. One of them, with rose-pink flowers, and a rich maroon blotch at the base of the corolla, has been named in compliment to the wife of the Director of the Royal Gardens, Kew. It is identical with a plant shown at the Drill Hall recently by Mr. G. Paul under another name, but he gracefully withdrew his name in favour of that here given. This is a most strikingly handsome Rhododendron, as will have been seen by anyone who has walked through the Rhododendron Dell at Kew within the past weeks.

*R. Frances Threlton-Dyer* is the second hybrid above referred to. It resembles the last-named in all points except the colour of the flowers, which is bright rosy-red, with a large blotch of maroon in the throat.

#### MESSRS. G. PAUL & SONS' FORTUNEI HYBRIDS.

Some years ago Mr. Paul secured a plant of *R. Fortunei* with larger flowers than the type, and named it Mrs. G. Butler. It will be remembered that *R. Fortunei*, a Chinese species, is a near ally of the large-flowered Himalayan *R. Aucklandi*, from which it differs mainly in having flowers about 4 inches across, coloured pale lavender-rose, each flower having six or seven segments instead of the usual five. It is quite hardy, generally flowers about the beginning of May, and is one of the most fragrant of all Rhododendrons. Although introduced by Fortune from China in 1859, and figured in the *Botanical Magazine*, t. 5596, it does not appear to have attracted much attention, notwithstanding its hardness, the large size, attractive colour and elegance of its flowers, and their fragrance. So far as I have been able to ascertain, it has not been used as a breeder by anyone except Mr. Luscombe sixteen years ago, and more recently by Mr. George Paul, who saw possibilities in it, and crossed it with the following select garden sorts, *Blandyanum*, *Scipio*, *Lady Armstrong*, *Mrs. Fitzgerald*, *Lady Emily Peel*, *James M. Brook*, and *H. W. Sargent*. Two of the hybrids thus obtained were shown at the Temple last year as Duke and Duchess of York, and obtained First-class Certificates. Mrs. W. T. Threlton-Dyer is a third, and a fourth called Profusion, obtained an Award of Merit at the Drill Hall on May 5. In the nursery at High Beech, Messrs. Paul have about 1000 plants of these hybrids, and on May 8 I saw many of them in flower. It is no exaggeration to describe them as a magnificent new race of Rhododendrons, quite distinct from the arboreum × caucasicum × ponticum × catawbiense race, and equal in beauty to the best of them. They range in colour from almost pure white to bright rose-red, with blotches of maroon, or spots of red, pink, yellow, or emerald green; in many the trusses are almost as compact as in *R. Broughtoni*, quite as large, and some are quite as effective. Others have looser trusses, after the style of *R. Fortunei*, many of them are fragrant, and all are hardy. The only possible objection that can be raised to them is that of flowering at a time when destructive spring frosts sometimes occur, but this is a deterrent only in the less-favoured parts of the country, and even there these plants deserve to be grown under glass. In the south and west these Fortunei hybrids will have the greatest value. Mr. Paul is to be congratulated on his success.

*R. Falconeri erimium*.—Specimens of this grand variety of a noble species were sent to Kew last month by Mrs. Lucy Farrant, of Ballamoar, Sulby, in the Isle of Man, who wrote:—"The plant is growing in the open air without any shelter in winter. It is 18 feet high, and about 20 feet in diameter. It produced this year twenty large trusses of flowers, and it has only once before flowered, namely in 1892, and then more profusely. The plant was not protected during the excessive cold and snow in the winter before last, and it did not suffer." There is a fine specimen of this variety in Lady Swansea's garden at Singleton, and it is not unknown to the Rhododendron fanciers of Cornwall. It is grown in the Temperate-house at Kew.

*R. Nuttallii* has lately developed two fine trusses of enormous flowers in the temperate-house at Kew, where also *R. Aucklandi*, *R. Veitchii*, *R. formosum*, *R. arboreum*, *R. grande*, and other Himalayan species have flowered well this year. I can recommend the hybrid *R. Forsterianum* as a beautiful greenhouse Rhododendron, its flowers being larger than those of *R. Veitchii*, and of a dazzling snow-white.

*R. Kewense* (*Aucklandi* × *Hookeri*) is magnificently in flower in the Dell at Kew, where some large bushes have stood without protection for the last five years. Another beautiful hybrid, *R. Mangiesii* (*Aucklandi* × *albo-grandiflorum*) is also flowering outside at Kew. Such species as *R. glaucum*, *R. anthopogon*, *R. niveum*, *R. campanulatum*, *R. Thomsoni*, *R. fulgens*, and *R. cinnabarinum*, have flowered exceedingly well in the open. The collection of Rhododendrons in the Dell is now exceptionally rich in species that are hardy, and the best of the garden

sorts. A large number of early-flowering hybrids have astonished us this spring by their beauty and display of flowers. It is true that a Rhododendron which flowers between February and the beginning of May is sometimes nipped in the bud by frost, but given a favourable spring such as the past has been, these early comers have a great value. There have been Rhododendrons in flower outside at Kew since midwinter, and there will be a grand display from now onwards till July. A large bed of *Azalea amœna* has been a rich crimson glow for the past fortnight; it is as hardy as the common Laurel. The *Azalea* garden near the lake is rapidly assuming its brightest colours, and promises to be in about a week the best exhibition of hardy deciduous *Azaleas* ever seen. Truly, Rhododendrons are the most generous of all garden shrubs. The majority of gardeners know of their value, but only a few appear to be fully alive to their capabilities under careful treatment, and with a comprehensive collection. *H. Watson.*

**RADISH WITH CONCRESCENT SEED-LEAVES.**

We owe to the courtesy of M. G. Tourret-Grignau, St. Maur les Fosses, the receipt of the curious Radish of which we give a figure. As will be seen from the illustration (fig. 117) the two cotyledons were inseparably joined so as to form a funnel-shaped cup. Curiously enough the two following leaves, though rudimentary, show a similar fusion. It will be remembered that in some *Delphiniums* and *Umbelliferae* the cotyledons remain united, but we do not remember to have seen so perfect a funnel-shaped production before. We do not find a similar case in Sir John Lubbock's book on seedlings.

**MANURES FOR MARKET GARDENS.**

EXPERIMENTS with artificial manures on garden crops were started in the spring of 1895, on a new market garden near the Little Orme's Head, Carnarvonshire. The garden is under the management of Mr. E. G. Metcalfe, Y Winllan, Windmill, near Conway. The ground, which has only recently been broken up from pasture, lies rather low, and is sheltered from the north by the Little Orme's Head. It is not in a high state of cultivation.

Artificial manures are of very great importance to gardeners, who, unlike the farmers, cannot supplement the supply of fertilisers by buying cake and corn to feed the cattle on the farm and so increase the richness of the farmyard manure. But the special manures so much advertised for use in gardens are often sold at such exorbitant prices, as much as 48s. per cwt. being asked for them, that although they may be, and often are, of good quality, it will generally be found very much better and cheaper to buy the simple substances, from which these so-called garden manures have been compounded, under their proper names.

The weather was not favourable to the experiments, the sowing of seeds and manures being followed by many weeks' dry weather. In a good season we might reasonably look for more profitable results, but even now, we see by the figures given below that an addition of phosphatic manures is particularly useful for garden crops, such as Peas and Beans.

The analyses and prices of the manures used are stated in the following table:—

Manure.	Percentage of nitrogen equal to ammonia.	Percentage of phosphates.		Percentage of potash.	Price per ton.
		Soluble.	Insoluble.		
Superphosphate ..	..	25.0	4.20	..	£ s. d. 3 2 6
Basic slag ..	..	..	49.19	..	2 5 6
Kainit ..	..	..	..	12.95	2 9 0
Nitrate of soda ..	19.0	..	..	..	9 10 0
Peruvian guano ..	8.22	..	44.52	..	13 0 0

**EXPERIMENTS WITH MANURES FOR PEAS.**

It is generally known that much manure does not pay in the case of Peas. If the ground is rich, it is not suitable for early Peas, because too much straw is produced, and the pods are late in forming and filling. Rapidity in maturing secures better prices earlier in the season. The excessive production of stem and leaf is brought about chiefly by excess of nitrogenous manure, e.g., nitrate of soda, ammonium sulphate, or heavy dressings of dung. Peas obtain a large portion of the nitrogen they require from the atmosphere, and an excess in the soil is not profitable. For this reason, heavy dressings of farmyard manure are undesirable. It is usually better to supplement the resources of the soil with some artificial manure, which will supply phosphoric acid, and, for some soils, potash also. The manuring of such crops as Peas then becomes a comparatively simple matter, as we need only in general supply these two substances.

**EFFECT OF ARTIFICIAL MANURES ON PEAS.**

The land received a moderate dressing of stable manure, and the artificial manures were applied to

FIG. 117.—A MONSTROUS SEEDLING RADISH.

the drills before the Peas were sown. Each plot consisted of two rows, 11 yards long, one row of "Prince of Wales" Pea, and one row of "Trophy" Pea, both wrinkled Marrows. The seed was sown on March 14, 1895. The plan of manuring and the results obtained on each plot are stated in the following table:—

Plot.	Manure applied per plot.	Cost of artificial manure applied per plot.	Weight of produce per plot.	Value of produce per plot at 2d. per lb.
I.	Stable manure .. .. . 4 lb. superphosphate .. .. . 2 lb. kainit .. .. .	2d.	84 lb.	14s.
II.	Stable manure .. .. . 4 lb. basic slag .. .. .	1d.	96 lb.	16s.
III.	Stable manure .. .. . 4 lb. superphosphate .. .. .	1½d.	90 lb.	15s.
IV.	Stable manure .. .. .	..	73½ lb.	12s. 2d.

The Peas on all the plots were picked as soon as

they were ready for use. Full particulars of picking are given in the subjoined table:—

*Weight of Peas picked on Different Dates.*

Date of Picking.	Plot I.	Plot II.	Plot III.	Plot IV.
July 18 .. .. .	lb. 7	lb. 8	lb. 6	lb. 16
" 20 .. .. .	5	6	8	..
" 22 .. .. .	..	..	..	10
" 24 .. .. .	8	10	12	2
" 25 .. .. .	..	8	..	..
" 26 .. .. .	10	..	12	9
" 27 .. .. .	6	12	8	..
" 29 .. .. .	20	30	..	18

" 8 .. .. .	25	..	..	..
	84	96	90	73½

The plot which was dressed with basic slag at a cost of about a penny gave the best return, and produced an increase of 22½ lb. of Peas of the value of 3s. 9d. over the plot which received no artificial manure. Basic slag seems to be a particularly suitable manure for Pea crops, a conclusion previously arrived at by Professor Wagner. Superphosphate also proved beneficial, but the plot which received 2 lb. of kainit, in addition to the superphosphate, did not do so well as that which received superphosphate alone. We should have expected an increase from the potash in the kainit.

**EFFECT OF SUPERPHOSPHATE AS A TOP-DRESSING FOR PEAS.**

When the experiments were started, some early Peas (Laxton's Earliest of All) were already sown. The land had been dressed with lime and a moderate quantity of dung, and was considered to be in good condition for growing Peas. In order to test the effect of a top-dressing of superphosphate, two plots, each consisting of three rows, 11 yards long, were measured off. One of these was top-dressed with 4 lb. of superphosphate at a cost of 1½d., while the other received no additional manure. Owing to the dryness of the season, the Peas came up badly. The plot dressed with superphosphate had such a poor appearance at first, that it was thought it would be a failure. It improved later on, however, and was ready for pulling some days earlier than the plot which received no top-dressing.

The weight of Peas on each plot, and the prices realised by Mr. Metcalfe, are given below:—

*Plot top-dressed with 4 lb. superphosphate.*

Date of gathering.	Weight of Pods.	Value.
June 18	16 lb. at 3d. .. .. .	s. d. 4 0
" 19	10 lb. at 2d. .. .. .	1 8
" 24	20 lb. at 2d. .. .. .	3 4
" 25	10 lb. at 2d. .. .. .	1 8
" 27	8 lb. at 2d. .. .. .	1 4
" 29	8 lb. at 2d. .. .. .	1 4
Total 72 lb. .. .. .	..	13 4

*Plot not top-dressed.*

Date of gathering.	Weight of Pods.	Value.
June 19	7 lb. at 2d. .. .. .	s. d. 1 2
" 22	10 lb. at 2d. .. .. .	1 8
" 25	18 lb. at 2d. .. .. .	3 0
" 28	20 lb. at 2d. .. .. .	3 4
July 1	12 lb. at 2d. .. .. .	2 0
Total 67 lb. .. .. .	..	11 2

The table shows that the produce on the superphosphate plot realised 2s. 2d. more than that on the other plot, and as the superphosphate only cost 1½d., there was a nett profit of 2s. *F. V. Dutton, Agricultural Department, University College, North Wales.*

## VEGETABLES.

## SPRING CABBAGES.

JUDGING by what may be seen in many directions, the evil of prematurely bolted Cabbages seems not to be nearly so wide-spread as was first imagined. For that reason, Cabbages now are very cheap and abundant. When first the bolting was mentioned, seedsmen remarked that the result was due to the planting of the wrong varieties. Naturally, it became a matter of exceeding interest to find out which ones, amongst so many varieties, did bolt, and which remained steadfast to character. It seems that Cabbages of what are classed as of the Nonpareil type have been the worst offenders, whilst they are excellent for spring sowing, and heart-in during the summer admirably. Going through numerous gardens of late where Cabbages have generally behaved well, I have made inquiries as to sorts, and have found the Reading strains of Sutton's Flower of Spring, Ellam's Early, and Sutton's Imperial, amongst others, to have proved exceptionally good. This shows that when seedsmen said earlier that if only the right sorts were grown, there would have been no bolting of to flower, they were right. Whilst the winter's experience has proved so much, it has also shown that unduly-early planting, because of the heat and drought of last autumn, also materially helped to bring sportiveness into the Cabbages largely. However, the trouble for this season is now practically over, and those who have specially suffered in their breadths, now know how to avoid similar trouble in future. *A. D.*

## CABBAGES BOLTING.

It is seldom that we hear so much of Cabbage failure as there has been reported this season. In Scottish gardens, as well as in more southern districts, bolting has taken place. I never was troubled with such difficulties to any extent, and I am perfectly free from it this season. I am prompted to write this because I planted at the middle of last September on a well-dug piece of strong ground, and used a number of early varieties, all well proved before. I also received about 300 plants from a nurseryman who sends out many thousands of plants in excellent condition (stunted plants of any of the Brassica family are unsafe), every plant I received from him has done first-rate, and 500 or more plants raised on the place have done similarly—none has failed. The person, however, from whom I had the plants tells me his experience. He says, that plants taken from the same seed-beds have all bolted! The variety is a very choice stock of McEwan's—a sort which has long retained a good name among Scottish gardeners—why one lot should entirely fail and the other succeed is a query! Veitch's Earliest of All is the best I have tried for first cutting. They are now well over (May 28), all being firm and handsome, with little waste. A succession crop of Cabbages planted towards the end of March is now ready for use: they were the smaller plants from those planted in September, pricked out on a border, and afterwards planted in drills. They are as good as one could wish, and none has bolted. *M. Temple, Carron, N.B.*

## BOOK NOTICE.

## OS CHRYSANTHEMOS E A SUA CULTURA.

By H. Cayeux.

This, although not, strictly speaking, a new book, has only just reached us, and is probably the first independent treatise that has been published in the Portuguese language about Chrysanthemums. The author is head gardener at the Polytechnic School at Lisbon, and he has produced a well-printed, paper-covered treatise of about sixty pages, dealing with most of the phases through which the popular flower must pass to ensure success. In the first part the reader is instructed in the history, origin, and classification, followed by a few pages of directions concerning composts, manures, watering, and pots. Propagation and culture occupy by far the greater portion of the book, and under the latter heading such subjects as disbudding, growing large show blooms, specimen-plants, &c., with suitable lists, appear to be fully treated. Mr. Cayeux's work concludes, as most such

books do, with a short chapter on insect pests and maladies. The appearance of this new addition to the literature of the popular autumn flower is only another testimony to the widespread interest in the subject upon which it treats, and tends to prove that the long-prophesied decadence of the Chrysanthemum is still as far off as ever. Continental authors have during the past three or four years been conspicuous by their activity in Chrysanthemum literature.

## THE WEEK'S WORK.

## THE FLOWER GARDEN.

By HEDLEY WARREN, Gardener, Aston Clinton, Tring.

**GENERAL WORK.**—If cold winds prevail, and the night temperature continues low, the most tender plants should not be planted out even now. Much watering has been necessary, but this should not be overdone, and if the weather should be cold, give the plants only sufficient moisture to keep them going. Continue to water and mulch all late-planted trees and shrubs, and syringe them occasionally overhead during the latter part of the day. Mow with scythes the grass under and around trees and shrubs which the machine cannot reach. Where necessary, water herbaceous and other plants in the borders. Stake Sweet Peas, tie-in and train Clematis, Roses, and other climbers. Mignonette, and other annuals sown on borders to supply flowers for cutting purposes should be well supplied with water, or many plants will perish from drought.

**ROSES** are already attacked by the maggot, and serious damage will be done if prompt attention be withheld. The insects are easily detected by the most inexperienced by reason of the curled leaves. Hand-picking is the surest means of destruction, and this should be continued until the trees are quite clear of the pests. Mulch all trees where it is possible, and afford a good soaking of water afterwards. This will stimulate the plants, and prevent the too-rapid evaporation of moisture from the soil. If large blooms are required, disbudding must be done.

**HERBACEOUS BORDERS** are very dry, and the plants should be mulched. Campanula pyramidalis and others developing their flowering-spikes, should be supported with neat stakes and securely tied.

**RHODODENDRONS** are still making a fine show in the gardens and shrubberies, and the present is an excellent opportunity of making notes as to desirable varieties for future planting.

**PINK AND WHITE THORNS** have generally carried wealth of blossom. These are most accommodating in the way in which they adapt themselves to almost any soil and position, but a good loamy soil on gravel seems to suit them best. Planted in groups, they make a prominent and very pretty feature in the foreground of plantations and shrubberies. As specimens on the lawns or in the park they are also attractive. Paul's Crimson is an excellent variety, and very striking in colour.

## THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorset.

**EAST-INDIAN HOUSE.**—So soon as Cypripedium Lawrenceanum, C. barbatum, C. superciliosum, C. Stonei, C. Rothschildianum, C. Curtisii, C. grande, C. macrochilum, C. Swainianum, C. selligerum, &c., have recovered from the effects of flowering, examine them to see if further root-room be necessary. None of them should be left long in a pot-bound condition, and the present is a suitable time to repot them. Fill the pots about one-third full of crocks, and use a compost of rough fibry peat, fresh sphagnum-moss, and broken crocks. For a few weeks afterwards keep the compost just moist, but afford abundance of water when the plants are re-established, and at all times keep the plants on the shady side of the house. When closing this house each afternoon, many of the Cypripediums delight in a gentle sprinkling overhead with tepid soft water, but not such as C. Stonei, C. Lowii, C. levigatum, C. philippinense, C. Parishii, C. Rothschildianum, and C. praestans, or the water may remain low down in the centre of the growths and cause them to decay. Renanthera Storiei is now showing its flower-spikes, and R. coccinea should be placed near the roof-glass on the sunny side of this house, and be well syringed overhead several times daily. Platyclinis filiformis, P. glumacea, most of the Dendrobiums, especially D. Huttoni, D. Dearcii, D. triandrum, D. subclausum, D. rhodostoma, D.

glomeratum, D. fimbriatum, and D. sanguinolentum should be treated similarly, being particularly liable to attacks from red-spider. Of plants now in bloom, none are more attractive than the Thunias. The beautiful green foliage sets off the arching flower-spikes to excellent advantage. All the following species and hybrids are well worth adding to any collection: T. Marshalliana, T. Beusoni, T. candidissima (pure white), T. alba, T. Veitchiana, and T. Brymeriana. Full instructions for the propagation of Thunias were given on p. 362. When the plants pass out of flower they should be removed to a cool airy house, where they will receive uninterrupted sunlight. They should be watered so long as the leaves remain green, but when they commence to change colour the supply may be gradually withheld. In the sunny house the leaves frequently become infested with thrips and red-spider, but they may easily be eradicated by laying the plants down on their sides and syringing them with the "XL All" insecticide or soft rain-water and soap. Earkeria elegans, B. melanocephala, B. Lindleyana, and B. cyclostella are well worthy of attention, for when well cultivated their pretty spikes brighten up the house for a long time during the dull season. They are now commencing to grow, and will require generous treatment. They thrive best when set firmly on teak rafts, upon which is placed some sphagnum-moss; or fastened to twigs of Birchwood, these being placed in well-drained pots or pans with a surfacing of fresh moss. Prior to giving them a fresh start, let each young growth, stems, and old roots, be thoroughly examined for mealy-bug, which, if not completely eradicated, will get into the new wood and sphagnum-moss, and give trouble throughout the growing season. Suspend the plants from the roof in an intermediate temperature, and afford copious waterings during active growth. Eulophiella Elisabethe is fast developing its curious creeping rhizomes. This pretty species appears to enjoy plenty of root-room, and being a deeply-rooting subject, rather large pots are preferable to pans. When re-potting the plants, afford plenty of drainage, and use peat, loam, and moss in equal proportions. Place them in a moist shady corner of the hottest house. I would advise those who have plants of the lovely Eulophia guineensis that do not thrive satisfactorily, to suspend the plants on the sunny side of the Dendrobium-house, and to give them identical treatment as given to those species. Under similar conditions, plants here are growing exceedingly well. Plants of Cattleya Schilleriana that have done flowering should be removed from the East Indian-house to an intermediate temperature. C. superba will require abundance of water at the root during growth, and should be suspended in a light position in the warmest house. After flowering, it may be placed with C. Schilleriana, and while at rest both species require but little water.

## THE HARDY FRUIT GARDEN.

By G. WOODGATE, Gardener, Rolleston Hall, Burton-on-Trent.

**THE FIG.**—The trees have now made sufficient growth to necessitate the removal of any superfluous shoots, that no overcrowding may exist. The leaves being very large, considerable space must be left between the branches to allow perfect development. Reserve for nailing-in those shoots which are best placed, and those which spring from the base of the older wood, so as to keep the centre of the trees well furnished with young growths. Remove all others; thus the full strength of the trees will be concentrated into the perfecting of the present crop, and of the young growths, which will produce next year's crop. The roots of Fig-trees are generally and necessarily confined in small borders, and they should therefore be given at this season frequent waterings, with manure in dilution.

**THE SUMMER THINNING** of young growths on cordons, espaliers, pyramids, and bush-fruit trees generally, is often much neglected, and what with the summer pinching and the winter pruning, the branches become completely covered with growth, and devoid of fruit-buds. Cordon and espalier-trees, especially dessert Pears grown on this principle, are very liable to push out numerous young growths from the spurs. In such a case, disbudding must be severe, and no more should be left than are absolutely necessary, and these should be those that are placed in the best position for the formation of new spurs. Pyramidal and bush trees are not generally so persistent in producing young growths as the former, but these also require to be thinned of many of the young shoots, that light and air may circulate freely through the trees.

**MORELLO CHERRIES** should be cleaned of all petals that remain among the clusters of fruit, or they will help to harbour insects. Preserve sufficient of the young wood for next year's fruiting; stop at the third leaf all foregoing shoots that may be required for forming fruit-spurs, and gradually remove the remainder; and pinch out the points of the leading shoots which have reached the limit of space allotted. Morellos are very susceptible to attacks from black aphid (*Aphis cerasi*), and this should be prevented by giving the trees forcible syringings of water early in the afternoon of each day, and once a week a syringing with a solution of quassia, or some other well-known insecticide, may be given.

**VINES**—Stop the laterals at the second leaf beyond the bunch, and after these growths have been made secure, remove all others, with the exception of those left for extension, or for replacing old rods. Keep the Vines well syringed, and as early in the afternoon as possible, to prevent any insects gaining a foothold.

### PLANTS UNDER GLASS

By JNO. McINTYRE, Gardener, Woodside, Darlington.

**SOLANUMS**.—Plants cut back in March or April last, have made top-growth, and seedlings are growing apace. Select one of the cool pits that have been emptied of bedding plants, and fill it with a light rich compost to the depth of 15 inches, in which all the plants may be planted out. Give a square foot of space to each plant, and keep the frame close for a few days. Syringe night and morning until the plants have taken root into the new soil. The lights may then be removed until autumn. Keep the plants well supplied with water at the roots throughout the summer.

**EUPATORIUMS**.—Cuttings that were struck in March or April should be encouraged to grow rapidly. Keep the shoots regularly pinched, and by shifting the plants until they are in pots 7 or 8 inches in diameter, large plants may be obtained in one season. They are exceedingly useful during the dull winter months.

**AZALEAS**.—Many of the plants which were forced early will have completed their growth, and should be put into a cool-house preparatory to placing them out-of-doors, where they may remain during the summer. Thorough ripening is of great value in preparing Azaleas for winter flowering. It is of no use attempting to force plants that have not been well ripened out-of-doors early in the season. Any plants that are pot-bound should be given a watering with soot-water or liquid from the farmyard twice each week. Syringing overhead with clear liquid from the farmyard is a good preventative of thrip and spider. Late-flowered specimens may remain a month longer in the warm-houses.

**GENERAL WORK**.—The present is a good time to thoroughly rearrange the occupants of the glass-houses, as all the bedding plants have been cleared out. Many greenhouse plants can now be removed to pits or frames, and some stove plants that have made most of their growth may be moved into cooler houses. If an intermediate-house is available, the *Caladiums* and many other soft stove plants may be put in it. Extra room may thus be gained for plants which require a high temperature throughout the year. The *Marantas* have thrown up fresh foliage, and now appear very handsome. All the varieties are well worth growing, if space can be given them, for although not so useful as some plants for house decoration, they are splendid subjects for the ornamenting of the stoves. They are strong growers and require a rich compost. The plants should never be allowed to grow into old stools, or to remain year after year in the same pots. Break them up each year, unless the plants are required for exhibition, and even then they must receive large shifts annually to keep them vigorous. A compost of loam, peat, and dried cow or sheep-manure with coarse silver-sand suits them well. Where full collections of these cannot be grown for want of space, the following are a few of the more showy and useful varieties: *M. Kerchoviana*, *M. Lindenii*, *M. Makoyana*, *M. Massangeana*, *M. Veitchii*, *M. vittata*, *M. Warszewiczii*. When the plants are well established, give frequent waterings of liquid-manure.

**ACALYPHAS**.—These are as easily propagated as *Coleus*. When the summer is over, I generally winter three dozen plants, and cut them back at the beginning of December, when they are placed on a shelf near the glass in a warm-house. They then break afresh, and I thin the shoots out to four on a

plant. These I allow to grow until the end of March or beginning of April, by which time they have made strong, well-coloured tops. We then take these tops off 5 inches long, and put them in 3-inch pots. Crock these pots moderately, and place some rough half-decayed leaves over them, also a little soot over the leaves. Use a light compost of leaf-soil and loam equal parts, and place a little silver-sand in the centre of surface, so that when inserting the tops it may trickle in. Propagated in this way they never lose their colour. Plunge them in a propagating-box, and shade only during the hottest part of the day. As soon as they are well-rooted, shift into 5-inch pots, and place on a shelf near the glass. In the course of six weeks splendid plants will be obtained for furnishing purposes. If large plants are wanted for the conservatory, shift again into 7 or 8-inch pots. *Acalyphas* always show to most advantage if grown on single stems.

### THE KITCHEN GARDEN.

By C. HERRIN, Gardener, Droppore, Maidenhead.

**ASPARAGUS**.—The dry weather of the past three weeks has not tended to succulence in the shoots, and if no rain falls before these notes appear, it will be advisable to afford the beds a thorough application of water, and manure-water from stables and cowsheds may be added wherever obtainable, care being taken to dilute it considerably with clear water. It is an advantage to afford the beds which are to have manure-water an application of clear water, the manure-water being applied an hour or two later, and if the latter is not obtainable, fish-guano or nitrate of soda may be used instead. All kinds of weeds should be hand-picked from the beds; and while the cutting of shoots continues, both large and small should be taken, but the earlier cutting is now discontinued the better it will be for the plants. This is usually possible when Peas become fairly plentiful, that is, about the middle of the present month. If the planting of Asparagus has been delayed, it may still be done, provided the plants are got in with despatch, the stems secured to stakes forthwith, and the bed, after being well watered, mulched with rotten manure or leaf-mould.

**FRENCH BEANS**.—Plants in unheated pits and frames will be in full bearing, and the necessity for house culture no longer necessary. Continue to make sowings so as to keep up an unbroken succession, sowing some seed of the climbing French Bean in the open quarters. The plant has smooth-skinned pods, like the dwarf varieties, but it reaches a height of about 6 feet, and requires sticks of that height, and keeps on bearing a long time.

**OUTDOOR TOMATOS**.—The second week in June is, in the South, a perfectly safe time for planting Tomatos in the open, for although there may be no frost to materially injure them if planted earlier, the nights are cold, and the wind is often from the north-east, which injuriously checks growth in the plants, whereas the later-planted Tomatos begin to grow at once. If the plants have been brought on as advised in earlier articles, they will have the first trusses of fruit set, and the pots filled with roots, not root-bound, but in just the right condition for turning out. Vacant spaces on south or west walls or close fences should be utilised for Tomato-culture, also the southern fronts of forcing and other glass-houses. Tomato plants may also be planted away from such shelters, and trained with a single stem to stakes 5 or 6 feet in height. For this purpose a border with a south or west aspect should be chosen, and the plants set out in lines 2½ to 3 feet apart, and 18 inches from plant to plant in the lines. Such plants ripen their fruits rather later in the season than those trained to walls; but if strong plants are made use of, and attention be given to stopping the shoots, &c., nice crops may be grown in this way in most years, and when as favourable as last year, the cost of their cultivation is well repaid. A new position on the borders should be found for them each year, but in the case of walls and fences, where new positions cannot be so readily found, the old soil should be partially renewed. The soil for the Tomato should not be made very rich, as this is a cause of rampant growth that is not fruitful in this climate, and it is better to afford liquid-manure or some artificial fertiliser instead, the time for using this being when a good set of fruit is obtained. Before planting, let the ground be firmly trodden, and the soil left high around the plants when finished off, so as to form a basin. Unheated Potato-pits, as they become empty, may be used for growing Tomatos, the soil being made firm, and two plants put in the front of each light, with a few Pea-sticks

laid across the pit for them to trail over. Trail them with a single stem from the front to back of the pit. The lights may be kept off the pit during hot weather. Whether planting in pits or outside, the balls of soil should be moistened before planting, and if the border is dry, it should be watered a few hours before the planting takes place.

**HINTS ON CURRENT OPERATIONS**.—Remove the tops from Broad Beans when a crop of pods is set, and if the plants are likely to be blown over, pass string down each side of the row, and secure it to short stakes. If a late crop of Broad Beans is required, another sowing may be made. Runner Beans before they begin to run should have stakes placed to them, after having earthed them up; and where grown in circles the inner space should be covered with rich rotted manure. Another sowing may be made. In the event of failures occurring amongst the crops of Beetroot, Savoy, and Borecole, seed may yet be sown in drills which have been previously watered.

### FRUITS UNDER GLASS.

By W. POPE, Gardener, Highclere Castle, Newbury.

**EARLY VINES**.—As soon as all the fruit has been taken from the canes, afford a thorough syringing to clear them of insects or dirt. An occasional washing afterwards with the syringe, or, preferably, the garden-engine, will be necessary to keep them clean. Lateral growths must still be kept in check, and root-waterings should be given as often as the borders appear dry. The success or otherwise of next year's crop depends in a large measure upon the foliage being kept healthy until the growths are properly matured. Should red-spider have appeared, a good insecticide should be used, and every means taken to eradicate the pest without any delay. Pot Vines that are intended for fruiting early next season ought now to have grown to their full length. Give them every attention possible, and assist them by means of weak manure-water. They should be in a light situation, and have plenty of air, so that firm, early-ripened wood may be secured. Young permanent Vines planted in the spring need frequent attention in regard to tying, stopping, &c., and they should not be allowed to suffer from lack of moisture at the root. Mulchings of litter as helping to conserve the moisture are very useful.

**CUCUMBERS**.—Continue to plant fresh batches of these as the pits become cleared of Potatos, Beans, &c., and when these plants commence to bear fruits, the plants in the earliest houses may be dispensed with in order to make room for successional and late crops of Melons, &c. If, however, these plants cannot yet be conveniently spared, and they are in a fairly healthy condition, they should be encouraged to make a fresh start, by taking away the surface soil and replacing it with good lumpy loam, and a surfacing of well-rotted manure. Water well with weak tepid liquid-manure, and thin out the old exhausted growths. Shade from bright sunshine will be necessary for a few days, until the young growth has made an appreciable start, and close early in the afternoon to preserve the sun-heat, affording at the same time plenty of moisture. In the pits and frames artificial heat will scarcely be required, except, perhaps, in the colder parts of the country, but full advantage should be taken of sunshine by syringing and closing early. It is advisable to continue to cover the glass at night for some time longer, as the weather is still cold. Any plants in full bearing will require an abundant supply of water at the roots, and also overhead, by heavily syringing daily. Look over each plant twice weekly to stop the shoots and thin out superfluous growths, foliage and fruits. Where Gherkins are in demand for pickling, the plants are best when grown in a frame; and they should be planted at once.

**STRAWBERRIES IN POTS**.—Any plants that have yet to ripen their fruits may now be removed to pits or frames where they can have plenty of air without the baking which is often unavoidable on shelves in the forcing-houses. As soon as runners can be procured, make preparations for next year by layering into small 60's, which should be filled with rich, rather fine soil. For the earliest batch, a good stock of the old Keen's Seedling or Vicountesse H. de Thury is yet difficult to excel, but for later forcing Royal Sovereign is first-rate, President also is very good. The soil for the pots in which the plants will fruit should consist of rather strong, rich loam, with one-fourth part of well-rotted manure added. This compost ought to be well mixed a week or two before it is required for use.

## EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

## APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY,	JUNE 6	{ I of W. Hort. Assoc. Meet. Soc. Franc. d'Hort. de Londres Meet.
SUNDAY,	JUNE 7	{ Roy. Hort. and Agr. Society of Gleat Show.
TUESDAY,	JUNE 9	{ Roy. Hort. Soc. Coms.
WEDNESDAY,	JUNE 10	{ Roy. Bot. Soc. (Floral Fete. Geneva Exhibition temporary Sh. 14 days)
FRIDAY,	JUNE 12	{ Roy. Bot. Soc. Lecture.

## SALES.

THURSDAY,	JUNE 9	{ Highly important unreserved Sale of the Ardarrach Collection of Established Cattleyas and Lælias by order of R. Brooman White, Esq., by Protheroe & Morris (two days).
FRIDAY,	JUNE 12	{ Imported and Established Orchids, from various sources, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK—60° 1.

Agricultural  
Depression.

MESSRS. WILLIAM COOPER & NEPHEWS, "proprietors of Cooper's Dipping Powder," have

been at the pains to put a series of questions on the causes and remedies for Agricultural Depression to 100,000 farmers, and now lay before the reader in the form of a small pamphlet (which may be had from the authors at Berkhamsted, Herts), a general summary of the results. We must confess to a feeling of disappointment at the result. We are not told the number of replies received, so that the percentage results may be somewhat misleading, and the conclusions arrived at are by no means so uniform as on a first impression we should have imagined. But as the depression is general and by no means confined to this country, it is obvious on a more careful consideration that no such limited investigation can be adequate for the purpose. We can imagine the present results to be very puzzling to a statesman. What is he, or what is the House of Commons to do for the relief of the agriculturists, when, as is rendered evident, they do not themselves know what is good for them? There is, however, considerable unanimity in the demand for a further reduction of rent. Tithes are hardly more popular. Land is considered to bear too large a proportion of the rates, but the remedies and alternatives proposed are like the quack medicines which profess to cure all diseases. Taxes on cycles and on tradesmen's carts find favour with many, but we doubt if either the one or the other can be considered within the range of practical politics. Railway rates are by nine-tenths of the respondents considered too high, but as the farmers are not supposed to know the details and exigencies of railway-management, their opinions need to be put to the test of proof before their correctness can be assumed. They are practically unanimous in thinking that railways should be compelled to carry British produce at rates as low as foreign. Other things being equal this is, of course,

equitable—but are things equal? The railway companies who have to handle the goods would, we imagine, say No, and that if preference is given to the foreigner, it is because by his greater care in collecting and packing, thus lessening labour and expense, he earns it. In the meantime some of the companies have publicly denied the existence of any inequality in the rates for the conveyance of fruit.

A spirit of fairness and equity towards the landlord is conspicuous in many of the replies relating to compensation to outgoing tenants, and other matters bearing on the relation of the tenant to the landlord.

As to protection, more than half—60 per cent.—of the respondents are in favour of a duty on corn; the minority seem to look upon it as a lost cause. This view of the case is supported by the remarkable diversity on points of detail, which is shown by the would-be protectionists—a diversity so great, that we do not think the average legislator could arrive at any safe conclusion as to what the majority really do want. More than 90 per cent. of the respondents reply that foreign produce, including fruit, should be labelled as such.

Co-operation is another question upon which opinions are much divided; on the other hand, more than half the farmers are opposed to allotments and small farms. A very general opinion, nevertheless, is expressed, "that small holdings produce better labour, and also that the sentimental interest created in the minds of small occupiers by the possession of land is very beneficial, besides educating them in the difficulties under which their daily employer, the farmer, labours."

We now come to a question which more nearly concerns us: under the heading "Fruit-culture, Poultry, &c.," the question is asked—"Would the farming interest in your part of the country be improved by the further production of articles now largely imported, such as fruit, poultry, eggs, butter? If so, what obstacles exist to prevent such development?"

To this question 49 per cent. of Messrs. COOPER's correspondents say "No," 44 per cent. say "Yes," and the remainder are favourably disposed to it within certain limitations. Among the obstacles, high railway rates easily take the first place. "Whatever subjects," say Messrs. COOPER, "farmers differ upon, their unanimity on this point is wonderful." The British climate comes up for condemnation. "Our fruit," they say, "comes later than (even when it is not inferior to) the foreign article, and for this the wretched British weather is responsible. Quite a large proportion hold this to be a stumbling-block to any efforts to extend fruit-culture." Bad markets produce quite a general growl. "We can't get at the consumer . . . and we are at the mercy of the middle-men. If only we had a local collecting and distributing dépôt we could do well, or even if we could get regular direct customers in the towns."

The establishment of such dépôts does not seem to present any insuperable difficulties, but the farmer seems often to give way to despair, and to think that his condition is far too hopeless for such trifles as those to be of much service. We cannot pursue the subjects which Messrs. COOPER have thus brought before us. It is evident that they have supplied those interested with plenty of food for reflection. There is one subject they have only lightly touched on, but it is one that is significant. We allude to the enormous increase of culture under glass, with all the accompaniments of

high culture, high rental, and expensive labour, which may be witnessed not only round the metropolis but in the vicinity of other great towns. The reports that we published in these columns a year or two ago suffice to show that capital invested in such enterprise yields a satisfactory revenue, provided the employment of the capital be directed with brains and energy enough to secure the necessary adaptation of the procedures to the "environment." Some of the directors of these vast establishments have been, to our knowledge, farmers.

ROYAL HORTICULTURAL SOCIETY.—At a meeting of the Fruit and Vegetable Committee, held at Chiswick, May 28, there were present P. Crowley, Esq., chairman, the Rev. W. Wilks, secretary, and Messrs. C. E. Shea, J. T. Bennett-Poë, J. Douglas (members of the council), W. Bates, J. Wythes, J. Wright, H. Balderson, A. Dean, A. F. Barron, and R. Fyfe. A collection of Spinaches, growing in double rows on a west border, underwent inspection. There were thirty-three diverse stocks grown, only one having failed. The plants were in capital condition, and had been well thinned early in their growth. Prickly-seeded varieties were first dealt with. Of these it was found that the various stocks resolved themselves into three. The well-known Prickly-seeded Flanders, which is much the earliest to bolt off to flower, has long leaf-stalks, and somewhat pointed leafage, the large-leaved Improved Prickly, as named here, a fine stock from Messrs. Watkins & Simpson, but which seems to be identical, except in form of seed, with the round Virolday or Victoria. This is a very fine large-leaved Spinach, and specially of great excellence for market work; and third, the Long-standing Prickly-seeded, which is latest of all to bolt to flower, and has dark-green glossy and large-rounded leafage, of a very distinct and noticeable kind. Three stocks of this were all equally good. The Round-seeded Flanders was, apart from the shape of the seed, identical with the prickly-seeded one. The round Virolday, or Victoria, were evidently identical with the Improved Prickly, and the Round-seeded Longstanding the same as the prickly form. Three marks were given to both the Longstanders, the best stock of the round form coming from M. Heineman; and to the Improved Prickly. The result of the trial, therefore, is to show that there are but three really distinct forms of Spinach, each one having round and also prickly seed; also without doubt the finest for all purposes are the Longstanding and Virolday types.

— The next Fruit and Floral Meeting of the Royal Horticultural Society will be held in the Drill Hall, James Street, Victoria Street, on Tuesday, June 9. The Veitch Memorial Medals will be presented by the President to Messrs. BURBIDGE, DUNN, SARGENT, and H. DE VILMORIN. At 3 P.M. the Rev. Prof. HENSLOW will give a lecture on "The Movements of Plants," illustrated by lantern slides.

NATIONAL HORTICULTURAL SOCIETY OF FRANCE.—The Annual Exhibition of the National Horticultural Society of France, held in the Tuileries Gardens, May 29 to 25, cannot be said (remarks a correspondent) to have equalled the International Exhibition held in the same gardens last year. Gold medals seemed to be showered with a very free hand—a striking contrast to exhibitions in England. In the matter of new plants there was nothing of extraordinary merit, unless an exception be made of a new Canna, Canna Italia, shown by M. LAINE, which well deserved the silver medal it obtained. The plant, although not a vigorous one (owing undoubtedly to its being forced for the exhibition), was bearing two or three very fine flowers of a bright fiery red colour, with a broad border of golden yellow. A noticeable feature of the show was a splendid collection of Phyllocactus in flower, from the nurseries of M. CHS. SIMON, Saint Ouen, and for which he received a gold medal. MM. VILMORIN, ANDRIEU & Cie., seed merchants, Quai de la Mégisserie, Paris, were awarded a gold medal for a magnificent

FIG. 118.—RHODODENDRON MRS. W. T. THISTLETON-DIER: COLOUR ROSE-PINK, WITH A RICH MAROON BLOTCH AT THE BASE OF THE COROLLA. (SEE P. 702.)

collection of annuals and biennials, also a silver medal for their strain of Pansies. A fine collection of Gloxinias in flower came from the gardens of M. ROBT. LEBAUDY, Bougival (gr., M. Lepage), who received for them a gold medal. M. LOUIS CHRISTEN of Versailles exhibited a grand collection of Clematis in flower (gold medal). Orchids could not be compared with those of last year, owing probably to the absence of the two great rival establishments, SANDER and LINDEN.

**THE ROYAL BOTANIC SOCIETY.**—The Duke of TECK, President, took the chair at a meeting of the Council of the Royal Botanic Society on Saturday. The Marquis of BOTE, the Marquis of BRISTOL, the Earl of ANNESLEY, and other members of the Council were also present. Arrangements were made for a garden party and reception which the Duke of Teck intends giving to the Fellows on Thursday, June 25, in the gardens. It was also decided that as twenty-three Fellows of the Society, including ten members of the Council, had guaranteed the necessary expense, the experiment should be tried of providing a band on Saturdays in June and July, commencing on the 13th inst., when the gardens are open to the public. At a meeting of the Fellows of the Society previously held at the Museum in the gardens, Major COTTON presiding, it was announced that on Whit Monday 3246 visitors paid the charge of sixpence for admission to the gardens. The number on the previous Whit Monday was 4900. The attention of the Fellows was called to several specimens of a remarkable feathered Hyacinth which, in its native state, produces a few flowers surmounted by a feathered tuft, but which, in a cultivated state, bears only the aborted tuft without the flowers. *Times*, June 1.

**BATH AND WEST OF ENGLAND SHOW.**—At the Royal visit to the recent Bath and West of England Agricultural Show at St. Albans, the flower tent was visited by their Royal Highnesses the Prince and Princess of WALES. In the group of Messrs. PAUL & SON of Chesbunt they particularly noticed the new single Rose, Paul's Carmine Pillar, masses of which, from the open air, were shown. H.R.H. the Princess of WALES asked for and wore a bunch of the flowers, the Prince donning a button-hole of the same, an example followed by Lady SALISBURY and other members of the royal party.

**APPLES, ETC., FROM TASMANIA AND AUSTRALIA.**—On Saturday last (May 30), one of the P. & O. Co.'s well-known "fruit fleet" arrived at the Albert Docks, London, with a cargo of nearly 10,000 boxes of fruit—principally Apples from Tasmania. The bill of lading says:—"1732 boxes of fruit and 6666 boxes of Apples from Hobart; 1171 boxes of fruit from Melbourne; and 114 boxes from Adelaide." The total is 9683 boxes, and doubtless there will be a good sale for them at the various markets. The last consignment, of over 20,000 boxes, went well, and we note Tasmanian Apples are selling at from 10s. to 16s. per box, at from 3d. to 6d. per pound retail. Of course, small fruits from Keut and other counties will lower the price of Australasian fruits at the present season, although the prices for these English fruits are very cheap.

**CLUB IN CABBAGE.**—The April number of the *Journal of the Essex Technical Laboratories* contains a digest of a series of inquiries which had been addressed to certain farmers and market gardeners of the county. The Report gives an excellent account of the nature of the disease, and its distribution throughout the county. It shows how the disease may be spread by the carelessness which allows diseased roots to be thrown on to the manure-heap, and the still greater carelessness which permits diseased stumps to be ploughed in! Unfortunately, beyond certain obvious inferences, the reporter does not indicate any cure for the malady, nor, indeed, could he be expected to do more than urge that prevention is better than cure—a lesson that the farmers seem a very long time learning.

**TO DESTROY ANTS.**—Among the many ways recommended for destroying ants, one of the easiest

and most efficacious consists in laying in the places where they are accustomed to assemble pieces of thick twine or rope, about 1 foot long, which have been previously dipped in a syrup made of coarse sugar. The ants cluster in great numbers upon these strips, which, from time to time, can easily be taken up and dipped into boiling water. The same satisfactory results may be obtained from the use of a good sized sponge, sprinkled over with finely-powdered sugar; the sponge, thus prepared, being laid near the holes whence the ants issue, becomes in a short time quite a living object, the ants filling up the holes of the sponge, which may then be plunged into boiling water. *Book of Choice Ferns*.

**DAWLISH IMPROVEMENTS.**—At a meeting of the Dawlish Urban District Council, held at the Town Hall on May 20, Mr. F. M. CAMM presiding, Mr. F. W. MEYER, landscape gardener to Messrs. VERRILL & SON, of Exeter, read a descriptive paper on "How to make Dawlish more Attractive," and also submitted plans and an estimate for laying out Tuck's Plot and the Lawn, as proposed by the Dawlish Improvement Scheme. The plans showed several desirable features and improvements, including a rock-garden. On the proposition of Mr. AVANT, seconded by Mr. PARDOE, it was decided to frame the plans, and place them in a prominent position in the town. The chairman highly complimented Mr. MEYER on the excellence of his designs, which would receive the due consideration of the Council.

**PRECAUTIONS IN THE USE OF ARTIFICIAL MANURES.**—We read in the *Oesterreichisch-Ungarische Gärtner-Zeitung*, that a young farmer in Obersöllbach, Wurtemberg, employed in scattering artificial manure, had a light abrasion of the skin of the hand. Very soon symptoms of blood-poisoning showed themselves; medical aid was of no avail, and in a short time death ensued. It is advisable that those who must handle these various substances should be careful to wear gloves whilst at the work, and on no account to undertake it if they have wounds, however slight, on any part of the person.

**ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.**—The directors of this society met in Aberdeen on the 26th ult. Mr. D. M. SMITH presided. Reports were submitted from the various committees who have charge of the arrangements for the forthcoming show, and agreed to. The following gentlemen were appointed judges—Pot plants and hot-house fruit: Mr. Sharp, Freeland, Forgandenny, and Mr. Allison, Seaview, Monifieth. Cut flowers: Mr. Grieve, Edinburgh, and Mr. McLeod, Aberdeen. Vegetables and hardy fruit: Mr. Smith, Aberdeen, and Mr. Joss, Craigie, Dundee. Potatoes: Mr. Donaldson, Keith Hall, and Mr. Smith, Cullen.

**"A MANUAL OF FORESTRY."**—It is a matter for great satisfaction to know that this book, written by the capable hand of Dr. WILLIAM SCHLICH, has already reached its second edition. This is the best possible proof of the importance and value of the book, which now appears in a revised and enlarged form, by BRADBURY, AGNEW, & CO., 8-10, Boulevard Street, Fleet Street, E.C. We shall no longer have to lament the want of any high-class text-book of the subject in the English language. The fifth volume, devoted to the subject of forest utilisation, has just been published, and is the subject of notice in another column.

**"CASSELL'S NATURAL HISTORY."**—The issue of a popular edition of this book brings the information it contains within the use of all. The plentiful pictures and plainly-written tales may not all be new to adult readers, but for the younger generation should constitute a perfect store-house of charming and palatable lore. A notable feature of this publication is the series of plates, specially prepared from recent photographs of the animals in the "Zoo," and which will add much to its value and interest.

**PORTRAIT OF PROFESSOR OUDEMANS.**—The *Tijdschrift voor Tuinbouw* contains, in its last issue a portrait and short biographical notice of Professor

Dr. C. A. J. A. OUDEMANS. It will be remembered of this zealous worker that in addition to many distinctions conferred upon him in various countries, he has held, since 1859, the position of President of the University of Amsterdam. Dr. OUDEMANS presided over the International Horticultural Exhibition and Botanical Congress of 1865, the immediate predecessor of the never-to-be-forgotten 1866 London Congress, and the one at which the invitation to London was given.

**THE PEOPLE'S PALACE AND EAST LONDON HORTICULTURAL SOCIETY.**—The Hon. Secretaries of this Society desire to make it widely known that the third annual flower show will be held in the People's Palace, Mile End Road, London, E., on June 29, 30, and 31. Her Royal Highness the Princess LOUISE and the Marquis of LORNE have consented to open the show.

**SOUTHSEA ROSE SHOW.**—The Rose show and carnival to be held on the South Parade Pier on June 27, promises to achieve a considerable measure of success. The Mayor and Mayoress of Portsmouth have promised their patronage, as also have Admiral Sir NOWELL and Lady SALMON, Lieutenant-General and Mrs. DAVIS, Colonel-Commandant F. A. OGLE, R.M.A., and Mrs. OGLE, and many others. The Mayoress, Mrs. YOUNG, has consented to open the exhibition. Mr. WINDER, of Bristol Road, East Southsea, is the Hon. Sec. (*pro tem*.)

**"ICONES PLANTARUM."**—This publication, now edited by Mr. W. T. THISELTON-DYER, contains illustrations and descriptions of new or noteworthy plants received in the Kew Herbarium. It thus serves as an illustrated record of plants received from travellers and collectors in different countries often remote and little visited. In the present part we find a *Lithospermum Hancockianum*, t. 2457, from the mountains of Yunnan, which would be a desirable introduction to our gardens. *Homalopetalum* is a pretty little Jamaican Orchid, with nearly regular flowers, whilst the two lateral stamens, a 2, a 3, are represented by projections from the side of the column. Whether these bodies ever enter into the constitution of the lip as is here stated, is a matter for further enquiry. The Butter-tree of West Africa, *Pentadesma butyracea* is now, for the first time, adequately figured. Various illustrations are given of plants from Central Tibet, an almost unknown region, botanically speaking.

**"GREENHOUSE AND STOVE PLANTS."**—A new and illustrated edition of this book has been issued by Mr. JOHN MURRAY, Albemarle Street. A better guide than was Mr. THOMAS BAINES in all cultural matters can hardly be imagined; his judgment and experience were alike remarkable, and these qualities are reflected in his book. As the main object of the work is cultural, it would be well in future editions if the descriptive details were wholly omitted; or if retained, that they should be corrected, and rendered adequate. *Aralia Chabrieri* is now known to be an *Eleoedendron*. The article *Bambusa* needs reconstruction in the light of Mr. MITFORD's recent treatise. *Canna* and *Chrysanthemum* also deserve revision; and so with many others. Even the title-page would be better for a little modification. No author that we know of admits of "500 families," or anything like that number. The fact is, that the word "family," as here used, is an illustration of the laxity in the use of technical terms, which is common to the aity, but which is less excusable in experts. As a reference-book on all matters relating to cultivation, this work is specially valuable, and with a little revision it might continue to be the standard work on the subject for years to come. The illustrations are well executed.

**"MOUNTAIN, MOOR, AND LOCH."**—The publishers (Sir JOSEPH CAUSTON & SONS, London) have issued a second issue of this book. It is plentifully "illustrated by pen and pencil," and forms an attractive guide to travellers on the route of the West Highland Railway, where the scenery possesses not only remarkable beauty, but the added charms of association with both history and romance.

**ANDROGYNOUS CONES.**—The occurrence of male and female organs on the same catkin or in the same cone has frequently been observed in Pines and other Conifers, and instances have been from time to time figured in these columns. Quite recently Sir E. FRY has been good enough to send us specimens of this kind in the common Larch, as well as instances of proliferous cones in which the central axis has grown out beyond the cone in the form of a leafy axis. Not long since, Mr. KENJIRO FUJII, a graduate of the University of Tokio, published a paper in the Japanese *Botanical Magazine*, in which he showed that the changes are sometimes the result of mutilation, such as are practised by the Japanese gardeners. There are in the Pine two sorts of shoots: the extension or leader shoots (lang triebe of the Germans), and contracted shoots or spurs (kurz triebe). Mr. KENJIRO FUJII observed in *Pinus densiflora* that a great number of female or hermaphrodite flowers were developed in the positions where male flowers are usually found. He ascertained also that the

of the balance of nutrition must therefore be due to other causes besides mutilation, and the sudden access of increased supplies diverted from their original channels. In *Pinus cubensis* the androgynous condition appears every year in one particular tree, as we are informed by Dr. MELLICHAMP, who has on several occasions sent us specimens from South Carolina. What the inducing cause may be in such cases is a matter for further inquiry. We have also seen the malformation at Kew on trees of *Pinus densiflora* and *P. Thunbergii*, which had not been subjected to mutilation.

**GARDEN PINKS.**—There is planted at Chiswick a large collection of these most useful hardy garden flowers, which should, under more favourable weather conditions, furnish a very interesting trial. The earliest, a pure fringed white, of greater substance than is the old common white, is named *alba magnifica*; that variety was in profuse bloom much earlier than the old white, and ere Her Majesty had

Zealand, propose to hold, next March, a Potato exhibition. This is to be in celebration of the tercentenary anniversary of the introduction of the Potato into England from America, and it is desired to get together "as many varieties of Potatoes as possible from all parts of the world, with a view to showing the wonderful improvements made in the tuber since 1596, when it was uncertain which was the edible part, the apple or the root; and also with the object of choosing from the exhibits such varieties as may prove themselves worthy of importation." The Society will be glad to receive from growers and dealers small samples for trial. The names of the donors will be duly published.

**THE NEILL PRIZE.**—We learn that Mr. ROBERT LINDSAY, the late Curator of the Royal Botanic Garden, Edinburgh, has been unanimously awarded the Neill Prize for his services to Botany and Horticulture. The horticultural community will heartily endorse the action of the Royal Caledonian Society.

**THE SCOTTISH HORTICULTURAL ASSOCIATION.**—At an ordinary meeting of this association, held on Tuesday, June 2, Mr. HUGH FRASER presiding, there was read a paper by Mr. J. FRASER, of the *Gardening World*, London, on "Cross-breeding and the Hybridisation of Violas." In it he stated that the Violas of to-day were the work of some fifty years or so of cross-breeding, hybridisation, and selection. After dealing with difficulties experienced in raising good sorts, and relating his own experience, he said that by guiding and directing Nature they could sooner reach any given point along a particular line of development than if the flowers were left to their own resources.

**SCOTTISH METEOROLOGICAL SOCIETY.**—The *Journal* of the Society, containing the tables and other documents connected with the climatal conditions of Scotland in 1893 and 1894, has just been issued by Messrs. BLACKWOOD & SON. The details concerning the great frost of January and February, 1895, are of special interest, and especially those relating to the period between February 6 and 20, unquestionably one of the severest frosts on record, —17° being recorded at Braemar!

**"DICTIONNAIRE PRATIQUE D'HORTICULTURE."**—This useful work is making steady progress. The 49th *livraison*, recently published, ends in the middle of the article *Phalanopsis*, and contains a coloured plate of *Pentstemon Murrayanus*, var. (Paris: OCTAVE DOIN.)

**PUBLICATIONS RECEIVED.**—*Annual Report (for 1895) from the Botanical Station, Dominica.* Satisfactory, as a record of successful experiments, giving hope of still further progress in the future.—*Bulletin of Miscellaneous Information, Royal Botanic Gardens, Trinidad.* The more important papers are upon "Watercress," "Artichokes," "Roses," "A New Use for Sisal Hemp" (instead of horse-hair for cider-press cloths), "Notes on Mauring," "Introduction of *Lodoicea Sechellarum*," "Jamaica Drift Fruit," and "Chrysanthemums."—*The Principal Diseases of Citrus Fruits in Florida*, by WALTER T. SWINGLE and HERBERT J. WEBBER, forming Bulletin No. 8 from the U.S. Department of Agriculture, Washington. A useful issue, illustrated with plates and other pictures, showing the effect upon Oranges and Lemons of certain diseases, and mentioning how these ills may best be coped with.—*The American Persimmon*, Bulletin No. 60, Purdue University Agricultural Experiment Station, treating of the botanical nature, cultivation and varieties of this useful fruit.

PLANT PORTRAITS.

ROBERT LINDSAY.  
(Latest recipient of the Neill Prize.)

formation of such flowers is limited chiefly to the extension shoots, which result from the growth of the spur shoots of the preceding year. The production of long shoots from the spurs takes place regularly, when the long shoots are injured in any way as in the annual pollarding to which the trees are subjected. Hence, says Mr. KENJIRO FUJII, a flower of *Pinus densiflora* which, under normal conditions, will develop into a male, may be transformed into a female or hermaphrodite when a local increase of nourishment takes place. This local increase of nourishment in young shoots of *Pinus* can easily be secured in spring in the early stages of their development, firstly, by pollarding the shoots, and thus inducing all the nourishment in store to be used in the development of the remaining portion of the shoot, especially the flowers and the (kurz triebe) spurs nearest the wound. Numerous experiments made by Mr. KENJIRO FUJII confirm these opinions. The changes do not occur in *Pinus* and *Larix* only, but in other genera also, as in *Picea nigra*, a specimen of which is before us. In this plant there is no distinction into long and short shoots; nor, again, can we always see evidence of any mutilation in the trees which present these peculiarities. The disturbance

expanded a single bud. As these Pinks are so much in favour when cut for hunching as market flowers, so early a variety may well merit attention. If there be some forms that give large blooms, they all at least have the demerit of pod-splitting, whilst the very free-blooming smaller-flowered varieties have not that fault, and are therefore so much prettier for all ordinary uses. There are some rich-coloured flowers seen on later varieties, and these are peculiarly welcome in scented Pinks.

**"JOURNAL DE LA SOCIÉTÉ NATIONALE D'HORTICULTURE DE FRANCE."**—The report of the Horticultural Congress of 1896 includes papers on:—The History and Cultivation of Cattleyas and *Lælias*, by M. L. GRULLOCHON; Selection of Trees most suitable for Town Planting, by Mr. A. CHARGUERAND; other reports on the latter subject, by M. VAN HULLE and M. JULIEN LOZET, fils; Classification of the Best Varieties of different Kinds of Roses, by M. D. THOMAS; Chief Enemies of Roses, and How to cope with them, by M. F. DECAUX.

**NORMANBY HORTICULTURAL SOCIETY.**—The Normanby Horticultural Society of Taranaki, New

*CYPRIPEDIUM INSIGNE*, a double-page plate, containing coloured figures of the following varieties:—1, excellens; 2, Moortbeekense; 3, latina culatum; 4, rubidum; 5, Lindenise; 6, miniatum; 7, lucidum; 8, albo-marginatum. *Lindenia*, t. IX, DXI.

*CYPRIPEDIUM INSIGNE* VAR. *LUCIANI*, flowers wholly yellow, except the dorsal sepal, which is white at the tip and green at the base. *Lindenia*, t. DV.

## HOME CORRESPONDENCE.

**STRAWBERRY ROYAL SOVEREIGN.**—We were enabled to gather fruits of the new variety, Royal Sovereign, from plants growing on a south border on May 25, which was four days sooner than we could pick fruits of Noble and John Ruskin growing on the same border. Royal Sovereign is much superior, and I think it should be classed as a first early. For early forcing it is an excellent variety, and did well here this season. The drought will very considerably injure the Strawberry crop and shorten the season. The thermometer this morning, June 1, registered at three feet from the ground 33°, or 1° above the freezing point.—*Thos. Denny, Down House Gardens, Blandford.*

**BLOOM AND BERRY.**—We have long been familiar with the tradition as to an abundance of wild berries being the precursor of a hard winter. Amidst the great abundance of bloom seen this season on Blackthorn, Wild Cherry, Crab, and on Whitethorn, all indicative of heavy crops of fruits on these trees later; no trees show more profuse bloom than does Holly. This is commonly almost smothered with flowers, and if indicative of the berry crop to follow, then will Holly everywhere be bearing next winter a wonderful crop of berries. We shall then be enabled to see how far the tradition above referred to has a correct application. The remarkable inflorescence seen would by gardeners generally be attributed to the fine warm summer and autumn of 1895, to which cause also may be chiefly ascribed the abundant bloom found on most all cultivated fruit-trees. There is no doubt also we shall see very abundant berrying on numerous shrubs; indeed, a sort of universal fruit season. Doubtless, many readers have noticed this great bloom profusion; but ere another winter comes, may forget to notice not only what corresponding fruiting has resulted, but also the nature of the winter in relation to the fruit provision thus made for the birds, the chief consumers of berries. You seemed recently to have doubts as to whether birds ate the berries of the Aucuba [They let our's alone. Ed.]. I have known them to do so, and I also have heard many complaints of their doing so. But then, now that male plants are so generally found in gardens, Aucuba berries are produced in great profusion, and perhaps birds find in hard weather more than they need. During the past winter, in any case, other bird-food than berries seems to have been abundant. *A. D.*

**VITALITY OF SEEDS.**—When the meeting of the Fruit Committee was held the other day at Chiswick, in passing in front of the south border fronting the Peach-wall, Mr. Barron, who was present, drew attention to a plant that had recently come up in the soil from seed, and said that it was the progeny of some uncommon member of the Cucurbit family, which was grown on the border about twenty years previously, and never since. Still, almost every year after the ground had been dug, a few plants came up, showing great vitality on the part of the seeds thus preserved in the soil. Of course, nothing is known as to how many, if any, may have long since perished. The seeds differ from those of Cucumbers, &c., in being encased in a hard skin not unlike the seeds of Hemp. *A. D.*

**POND WEED.**—I once had charge of a similar piece of water to that mentioned by your correspondent at p. 681, except that it was four times the size, and had a bottom of mud. We managed to keep it always clear by having a pair of swans continually on or near

to it. An island in the middle with a Willow tree on it made a splendid nesting place for the swans, and they found enough weeds in the water to partially maintain them, merely requiring a handful of barley or some crusts of bread twice a day, and beyond this they got very little attention. They had been pinioned to prevent their flying away. The pond in question was partly surrounded by a steep bank, and wholly so by stakes and wire-netting, which prevented the birds from getting into the garden, for if allowed to do this they do much damage, especially when they have young ones. Your correspondent's pool being much smaller than mine, swans would be out of place on it, and half-a-dozen ducks should be put on it instead. He will probably find that they will save him the trouble of removing his Water Lilies, and keep the objectionable weed under, besides being useful in other ways. *W. H. Divers.*

—All weeds which float on the surface of the water and have no attachment by their roots to the mud, can be floated off, by having a broad-mouthed over-flow at the end opposite to that point from which the prevailing winds blow, and then if the water can be kept up to the full height, the floating scum, duck-weed, &c., are carried off without any effort. This is the so-called "frog-mouth." It may be from 5 to 20 feet in length, rounded at the edge, smooth, and perfectly level, so as to allow the gentle lapping of the water, when agitated by the wind, to carry over it every light-floating thing. It is, of course, in connection with a drain having a descent from the pond to a stream, ditch, &c. *X. Y. Z.*

—We have been troubled with the same thing as your correspondent, and have been obliged to skim the surface every week. This is, of course, impossible now the Lilies, Bullrushes, &c., are beginning to grow; and as an experiment we put in a good colony of sticklebacks. This was only done a fortnight ago, but the water has remained clear, and is perfectly so at present, although the drought has practically stopped the usual supply of fresh water, and the level has sunk to about one-half the usual depth of water. Our little pond is, like your correspondent's, lined with stone, blocks of cement, and puddled clay, with a layer of lean at the bottom for rooting in. The experiment is too recent to prove anything definitely, but it is a very easy one to try, and cannot well do any harm. *Thomas Fletcher, Grappenhall, Cheshire.*

—The "filmy green weed" spoken of by a Constant Reader in last week's *Gardeners' Chronicle*, is probably a species of the common Pond Weed (*Conferva*), which rapidly attains an extraordinary growth, covering the surface like a water fungus. In a pond at this place, artificially constructed, a remarkable specimen has lately been drawn out in a perfect state—it measures over 75 yards long, about 8 or 10 inches wide, and, when extended, presents a beautiful net work formation. This wonderful growth was made in less than three months, coiling round the pond in concentric rings; and now, in its dried state, it is tough and durable, suggestive of profitable conversion. *Wallingford Castle.*

**INSECTS ON FRUIT TREES, AND SPRAYING MIXTURES.**—I quite agree with my friend, Mr. Crump, of Madresfield, that as this is likely to be a record season for insect pests on fruit-trees, that much good will be done if your readers will record their experiences in dealing with them after the manner of Mr. Crump, p. 658. His more troublesome pest, the Pear-louse (*Diplosis pyrivora*), is not so with us, but the Winter-moth (*Cheimatobia brunata*) is with me a sad pest. Mr. Crump says he is surrounded with neglected Pear orchards; I am surrounded with Oak woods, in which the Winter-moth is as much at home as on Apple trees. I commenced to spray with Paris Green (Poison), combined with a modified form of the Bordeaux Mixture, on March 25. There are about nine acres of bush, standard, dwarf, and espalier trees of Apples, Pears, and Plums, but mostly Apples. The trees have been sprayed four times. Vermorel's Knapsack Pump, a most effective instrument, is used, and as I find that the mixture spoils the workman's clothes, I have a butcher's overall-trook for the man who does the spraying. The quantity of Paris Green is 4 oz. to 50 gallons of water, containing the Bordeaux Mixture. This dressing is most successful, and does not hurt the foliage, and the Paris Green mixture is not so poisonous as is generally supposed, for after spraying in March, I found that the bullfinches ate a quantity of the bursting Apple blossoms, without injury to themselves; but all the same, I take care to protect my crop of vegetables in use in the vicinity of the dressed trees, either by covering them with mats, or some such precaution—but as it is used as a fine

spray, the danger to health is very small. I said above that the Mixture is quite a success, and it is so in fairly-sheltered places, but an orchard exposed to a north-east wind in such a season as the present, I believe, a successful crop is out of the question; therefore, the situation of an orchard is an important matter. It should be well sheltered on land, and sloping to the south or south-west; and then by using such a mixture as I have described, a crop of fruit can be obtained in a season of ordinary character. A bad attack of the Winter-moth, with N.E. wind and drought combined, make a good crop of fruit, in spite of spraying, impossible. *R. M., Newbury, June 1.*

**CAMPANULA MIRABILIS.**—I do not well understand what the article on p. 648 means, mentioning a *C. Regina*, which, judging from the description, could only mean *C. mirabilis*, Alboff. As to the beauty of the plant, I judge it to be very remarkable; it must be remembered that Mr. Cuisin's plate was drawn from a dried specimen; notwithstanding, the beauty of the plant is admirably reproduced, especially in the life-sized branch; and if I may estimate the growth which the plants have made here up to date, we may expect to see much finer specimens than ever produced in its native place. It is as hardy as a weed, and grows in any sort of soil, and so far it will be an easily-managed garden plant. Whether it be a remnant of a bygone flora, I am incompetent to decide; but its entire vegetation and appearance is very distinct. The plate above alluded to is in *Tome III.*, No. 6, of the *Bulletin de L'Herbier Boissier*, 1895. *Max Leichtlin, Baden-Baden.*

—The *Campanula mirabilis* was found by my friend, M. Alboff, on September 2, 1894, on a perpendicular rock in the Abchasia mountains, and when he first spoke to me of that plant (of which he only found one example), he was so enthusiastic about it that he could not find for it a name corresponding to its beauty. He then regretted not to have been able to find any ripe seeds of it, but on my particularly asking him, he searched very near the capsules of the one plant he had collected and he found some (very few) ripe seeds. These seeds he gave to the Jardin Boissier and to our Jardin Alpin d'Acclimatation, and they gave nice plants which, I hope, will flower next year. The appearance of the plant is very peculiar, and has no relation with other *Campanulas*. I gave, in the *Revue Horticole* of Paris, p. 477, 1895, a description of it, after the description of Alboff in *Bulletin de L'Herbier Boissier*, t. III., No. 5 (fig. 6), and in his *Prodromus Florae Colchicæ*. I hope the new and beautiful *Campanula* of Alboff will soon be distributed in the gardens, as M. Leichtlin and myself have some for the trade. *H. Correvon, Geneva.*

**EARLY PEAS.**—If frames or pits cannot be spared, hasten those sown earliest; protection may be afforded on a sloping ridge. Plants from boxes should be planted on this in March, and wire Pea-trainers put over them, on which mats or other material may be spread when winds are cold or frost expected. Veitch's Chelsea Gem is the best we have tried for first gathering among dwarfs, and for several seasons past we have picked the first dish at the end of May. This variety, planted between Earliest-of-All, from seedlings raised in boxes, and with no other protection, is this year as early as on the ridges. Earliest-of-All sown in February is producing a fine crop, and was ready for use on June 1. Another sort deserving notice is Gradus, a little later than the former, but it produces fine large pods in great abundance. *M. Temple, Carron, N.B.*

**TELEPHONE AND TELEGRAPH PEAS (GROWN IN THE OPEN).**—I have to say (June 3) made gatherings of Telephone and Telegraph Peas from plants raised in heat during the first week in February, and transplanted in the open at the end of the same month. This is about a week earlier than I have heretofore gathered Peas of the same varieties, and grown under precisely similar treatment as regards time of sowing. Last year I was 12 days earlier than I had ever been before, and I showed Telegraph, together with specimens of William I. and Carter's Lightning, before the Fruit Committee on June 11. Herewith I send examples of Telephone and Telegraph Peas gathered to-day. [Good pods, moderately filled. Ed.] *H. W. Ward.*

**SIR JOSEPH BANKS AND MILDEW IN WHEAT.**—The following extract from a pamphlet, *On Mildew in Wheat*, by so eminent a writer as the late Sir Joseph Banks, first published about the year 1803, and more than once reprinted, contains a statement which appears to me so extraordinary, that I venture to send it to you in the hope that it may attract the notice of some of your readers who are better qualified

to give an opinion on the subject than I can pretend to be. It is as follows:—"Although the seeds of Wheat are rendered, by the exhausting power of the fungus, so lean and shrivelled that scarce any flour fit for the manufacture of bread can be obtained by grinding them, these very seeds will (except, perhaps, in the very worst cases) answer the purposes of seed-corn as well as the finest and plumpest samples that can be obtained, and, in some respects, better; for, as a bushel of blighted corn will contain one-third at least more grains in number than a bushel of plump corn, 3 bushels of such corn will go as far in sowing land as 4 bushels of large grain. . . . It is customary to set aside or to purchase, for seed-corn, the boldest and plumpest samples that can be obtained, that is, those that contain the most flour; but this is unnecessary waste of human subsistence. The smallest

sparrow, it has been observed, feeds its young at the rate of thirty-six times in an hour, for fourteen hours a day, and carries caterpillars and grubs to them by thousands in the week for some months in the year. The sparrow not only destroys the grubs of the Cabbage-butterfly, but the flying insect itself, which it is fond of catching. It also hunts and eats that most destructive fly called the "Daddy Long-legs," which lays its eggs beneath the turf, and the grubs of which live underground, and often lay bare whole pastures. The tit family does far more good than harm. They are always on the watch for blight, the Apple-moth, and a host of other destroyers too small for men to cope with, except by dangerous poisons. "Almost without exception," says Miss Carrington in one of the Humanitarian League's leaflets, "every small bird eats at least one-sixth its

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

The friends and supporters of this excellent Institution held their 57th annual festival in aid of its funds at the Hôtel Métropole, London, on Saturday, May 30, the Earl of Lathom in the chair. Among those present were Viscount Powerscourt, Sir Oswald Mosley, Sir J. S. Montefiore, Judge Philbrick, Mr. H. J. Veitch, Mr. N. N. Sherwood, Dr. Fletcher Beach, Mr. R. M. Hogg, Mr. Bailey, Mr. Arnold Moss, Mr. W. Cobb, Mr. J. Cory, Mr. C. G. Braikenridge, Mr. D. Guedalla, Mr. Icton, Mr. P. Barr, Mr. J. H. Laing, Mr. Gefton-Salmond, Mr. H. Williams, Mr. O. Thomas, Mr. W. J. Nutting, Mr. J. Rochford, Mr. C. J. Ingram, the Secretary. The Institution, as many of our readers are aware, was founded in 1838, with the object of relieving by means of pensions and otherwise, aged and infirm gardeners, market gardeners, nurserymen, seedsmen, their widows, and others engaged in horticultural pursuits. The pensions were originally £16 a year to men, and £12 to women, but in 1885 these amounts were increased to £20 and £16. During the time it has been in existence the Society has distributed in pensions and gratuities a sum of £68,000.

The Chairman, in proposing the toast of the evening, alluded to the almost universal love of flowers, and to the varied and interesting operations of gardening, which should appeal to all. He asked where we should be without gardens and gardeners, and showed how they ministered to the pleasures and necessities of modern life. He had seen gardens at home and abroad, and was a lover of the beautiful everywhere, and he saw no reason why those who contributed to the pleasure and conveniences of life should suffer in their old age; and a society which sought to help those in time of incapacity was deserving of support. He laid great stress on its being a self-help society with a subscription of only £1 per annum, which was so trifling a sum that almost every gardener could afford it. Another point is the preference given to those who have contributed to its funds. There were at the present 157 pensioners on the list—82 men and 75 women, with 31 cases awaiting election. The annual cost is £2,840, and to meet this the society possessed an assured income of £880 from investments. It therefore required very liberal assistance from its friends and patrons, and he felt sure that such a charity would not fail to receive the support it deserved.

Mr. H. J. Veitch responded to the toast; he said that ten years ago they had 104 pensioners, and even now, with a greatly increased number on its funds (157), there were numerous deserving cases which could not be entertained for lack of funds. Many gardeners, owing to bad times, were out of places, and the numerous calls on the funds demand a large increase in subscriptions, donations, and bequests.

Mr. Veitch eulogised Mr. Ingram's great exertions on behalf of the Institution, and made an allusion to the absence of Mr. John Lee, the only surviving founder of the Institution, on account of the infirmities of old age—he is about ninety years old. A letter was read from Mr. Lee, which showed that he had neither lost interest in the Society nor a sense of humour. The toast of "Horticulture" having been proposed by Judge Philbrick, and responded to by Sir Oswald Mosley, the secretary announced a subscription list amounting to £2180. The following are some of the subscriptions received:—

FIG. 120.—FIMBRIATED BEGONIA DUCHESS OF FIFE: FLOWERS PALE PINK, WITH ROSY-CARMINÉ FRINGE.

(Exhibited at the Temple Show by Messrs. J. Laing & Sons.)

grains, such as are sifted out before the Wheat is carried to market, will be found by experience to answer the purpose of propagating the sort from which they spring as effectively as the largest." I know nothing of botany, or of agriculture; but still I have always had an impression that Horace's maxim, "fortes creantur fortibus et bonis," holds good in the vegetable as well as in the animal world. And this, I presume, is also the opinion of Mr. Beaver (*Successful Farming*, 1871, p. 161), whose advice is, "Select for seed-corn the best samples you can find, even though you have to pay a few extra pounds for it; when harvest comes, you will be more than amply rewarded." Mr. B., I believe, was a practical farmer; Sir Joseph, I suspect, was not. R. N.

**BIRDS AND INJURIOUS INSECTS.**—Caterpillars are said to be very numerous in some fruit-growing districts. It would not surprise anyone to learn that this was particularly the case in Sussex, where a local bird-destruction-club boasts of having killed 5,922 sparrows and tomits in twelve months. The

own weight of food in twenty-four hours. And this food of birds consists entirely, or almost entirely, of the worst foes to agriculture." The late Mr. Wetherspoon, the famous fruit-grower, welcomed all small birds to his gardens. Farmers and fruit-growers who slaughter, and encourage the slaughter, of birds are indeed warring against their own best interests. *Joseph Collinson, Belyfarth, London, N. W.*

FIMBRIATED BEGONIA.

MENTION was made in our report of the Temple Show, and also in our last issue, p. 682, of the exhibit by Messrs. J. Laing & Sons, of a form of tuberous Begonia, in which the edges of the sepals and petals were toothed, the teeth being of a pale rosy-carminé, whilst the rest of the flower was of a paler pink hue. Our readers can judge from the illustration we now give (fig. 120) how far they approve or disapprove of the change.

## NURSERY NOTES.

## THE ORCHID SHOW AT MR. W. BULL'S NURSERY.

To admirers of the quaint and lovely Orchid family we can heartily recommend a visit at the present time to the above establishment, situated in the King's Road, Chelsea. Here the plants can be leisurely inspected, free from the crowding inseparable from a flower-show, and an hour may be pleasantly wiled away in the purest of pleasures. The art of the floral decorator has been called in to aid the cultivator, with the result that the present show exceeds in beauty of arrangement any of Mr. Bull's previous displays. Moreover, it teems with improved varieties, "sports," if we may so call them, in the absence of any known reasons for these lovely apparitions of Nature's handiwork. Crosses effected by mau are rare in this collection, if we omit those among the Cypripediums and Lycastes.

The view of the house from the door by which we entered left nothing to be desired. There seemed no space of vantage left unoccupied, nor did anything seem to be out of place; even the roof was made to serve a purpose in carrying a few baskets with racemes of flowers drooping over their sides. The chief species used in the making of the display consisted of Cattleyas, Lælias, Miltonia vexillaria, Dendrobiums, Odontoglossum crispum (a few), O. citrosimum, Cymbidium Lowianum in four or five varieties, and Lycaste Skinneri. These plants formed the basis of the display, and intermixed with these were the more choice and highly-priced gems. The showy yellow and brown flowers of Oncidium tigrinum were often repeated, Phaius assamicus was conspicuous for the choice contrast of its buff sepals and white tube, with internal rose-coloured markings; the drooping-habited Ausellia floribunda, a very floriferous African species, drew attention by the peculiar plan of its colours, which are greenish yellow, spotted with brown; some very beautifully-formed flowers of Odontoglossum citrosimum were noted in the variety; O. c. concolor, of a beautiful pale pink colour; O. c. punctatum, large and well-formed; and in O. c. p. roseum, in which the spots come out with great distinctness, giving added attractions to the flowers; O. c. carmen superbum has fair buff-coloured sepals and petals; O. crispum, var. stupendum, has magnificently-broad petals, with a corresponding regularity of form.

Cattleya Mendeli majestica appeared as an old acquaintance; at the least, that was our impression. It is an exceedingly fine-looking flower, with the usual purplish rose-coloured sepals and petals, and lip with a regularly-outlined, rich purple-coloured apex, cut off from the rest of the lip in a straight transverse line. The Mosaic varieties of Cattleya noticed were remarkable for some peculiarity in form or in colouring. C. M. grandis has a very beautiful lip, frilled, and rich in colour; C. M. Lawrenceana has a prettily-frilled lip, the beauties of which are enhanced by a narrow white edging. The nursery has always been famous for Lælia purpurata, and we found several possessing very fine features of one kind or another. L. p. Her Majesty has sepals and petals of the purest white, which form a splendid contrast to the dark radiant purple lip and throat, with the same coloured lines in it. L. p. fulgens is another variety with lip colouring of much brilliancy. L. p. Bella resembles Her Majesty, excepting that the lip is of mauve with dark lines.

The plants of Renanthera Lowiana are well flowered, large specimens in most instances, and differ in several points from each other. R. L. magnifica has a patch of more brilliancy and deeper shade of purple-brown than the ordinary types; and others have more yellow in the sepals and petals, which give the flowers a richer appearance, and a variety of shades were remarked intermediate between the lighter and darker flowers, and they all formed good foils to the masses of the more brilliant coloured Orchids.

Masdevallia Harryana var. Comet has flowers of

brilliant scarlet colour. A nice-flowered example of Brassia Keilliana was remarked; several of Odontoglossum Harryanum and of O. læve Reichenheimii, a very distinguished-looking species, with rather large and showy flowers, sepals and petals oblong, linear-acute, greenish-yellow, banded with purplish-brown, the lip rosy-purple, apex white, and not deflexed as in the type. It flowers abundantly.

Dendrobiums were not numerous, but we remarked examples of D. Devonianum and varieties of the same wondrously well-flowered, with the pseudo-bulbs or stems trained upright to sticks stuck in the baskets in which they grew. D. candidulum is not the least pretty of these, the sepals and petals white without the magenta-coloured lip of the type; the lip is also white, with an orange-coloured blotch in the middle. Plants of D. Jamesianum gave desirable patches of rich colour. Very conspicuous were the varieties of Miltonia vexillaria, for which the establishment has long been celebrated. M. v.

FIG. 121.—A FORM OF GARDEN ROLLER WITH SCRAPER.

amœna has very big flowers, the lip of great size and white. M. v. alba is distinct looking, and valuable as a variety; also M. v. abescens, M. v. radiata, M. v. rosea, and several more were noted in bloom.

Epidendrum prismatocarpum, a plant we seldom see at its best in private collections, is here to be seen in fine order, some of the plants bearing several scapes each bearing about fourteen flowers. It is excellent for flowering in the months of June and July, and will last for several weeks in perfection.

Of Orchids in smaller quantities, mention may be made of Disa Langleyensis, Masdevallia refracta purpurea, Oncidium Krameri, Lycaste Skinneri, Cypripedium Chamberlainianum, C. Mastersianum, the summer-flowering variety of Angreum sesquipedale, Odontoglossum polyxanthum grandiflorum, a flower with many rich tints of brown, chocolate, yellow in varying shades, and white; the bright purple-coloured Masdevallia Harryana, princeps, &c.

## NEW INVENTION.

## BRANGWIN'S GARDEN ROLLER, WITH SCRAPER.

THAT iron garden-rollers intended for use on turf, gravel-paths, and bare soil should have been made for fifty years or more without a simple contrivance for automatically removing the mud, clay, worm-casts, or whatever may adhere to the rolling surface, seems very strange, although some such scrapers are employed on steam street-rollers. Those who have had experience of the ordinary garden-roller will know of the loss of labour resulting from having to cease rolling for the purpose of cleaning off the adhering substances, or of keeping one man constantly at work cleaning the roller with a birch-broom, in doing which, he usually bespattered the adjoining turf or flower-beds with the removed small pebbles, clay, &c. This is, fortunately, a thing of the past, as for a very few shillings a scraper can now be bought and readily attached to the frame of a roller of either stone, iron, or wood (see fig. 121). The inventor and dealer is Mr. F. Brangwin, trading as F. Brangwin & Co., 58, Holborn Viaduct, E.C.

## SOCIETY.

## PANSY SHOW AT TAMWORTH.

MAY 27.—An exhibition of Pansies and Violas was held on Wednesday, in the grounds of Bolchall (Mr. Sydenham's), at Tamworth, and which was fairly well attended.

The Gold Medal and First Prize for forty-eight fancy Pansies, dissimilar, was secured by Mr. W. SYDENHAM; Messrs. J. SHELLE, of Blantyre, Glasgow, being 2nd; and Messrs. PAUL & Co., Aberdeen, 3rd. In the other open classes Messrs. SHELLE and PAUL were the principal prize-takers. In local classes for fancy Pansies, dissimilar, Mr. W. E. FOWLER (Fresley) obtained the first awards. Mr. J. W. PAUL (Wilcote) secured honours for fancy Pansies of one variety; and Supt. R. HANNAH (Atherstone) was successful in several of the Viola classes. The Rev. Dr. WATSON, of Water Orton, secured 2nd and 3rd prizes for fancy Pansies. There was not much competition in the cottagers' classes, but the displays were very creditable. The principal of the successful competitors in the open classes were Mr. R. (Newport), Messrs. T. NADIN (Derby), J. LAMB (Longton), T. WOODWARD (Coventry), and J. M. JOHNSON (Hints). The best bloom in the show was considered to be George Stewart, shown by Mr. FOWLER. A charming centre-piece of Nibetios Violas was shown by Mrs. SYDENHAM, and a Merit Certificate was given. Mr. Sydenham's Pansy grounds, containing upwards of a million plants in bloom, were open for inspection. The show was an improvement upon last year's exhibition. Coventry Standard.

## TRADE NOTICE.

MR. N. BLANDFORD, an old and valued contributor to these pages, and clever cultivator of Orchids, has retired from his post of head gardener to Mrs. Hasel-foot, at Moor Hill, Westend, Southampton, owing to failing health, after holding it for a period of twenty-nine years. He has settled at Bitterne, and is cultivating Orchids for sale, as well as the state of his health will allow.

NEW POTATOES.

MARKETS continue firm. French and Channel Islands produce from 8s. 6d. to 10s. 6d. per cwt. Canary arrivals virtually closed this week. Markets firm, 7s. to 9s. J. B. Thomas.

SEEDS.

LONDON: June 3. — Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., state that to-day's seed market, as might have been expected, was bare alike of buyers and of business. Meantime Clover, and especially Trefoil seeds, are held for higher prices. Increased rates are also asked for French, Italian, and for Trifolium incarnatum. There is no change in either Mustard or Rape seed. Blue-Peas and Haricot Beans with poor prospects, for green vegetables tend upwards in value. The new Wisconsin Green Boiling Peas attract increasing attention. As regards Bird seeds there is no fresh feature.

FRUIT AND VEGETABLES.

BOROUGH: June 2.—Quotations:—Cabbages (summer), 2s. 6d. to 3s. 3d. per tally; Onions, 6s. to 7s. per cwt.; Spring do., 9d. to 1s. 3d. per doz. bunches; Carrots and Turnips, new, 4d. to 6d. per bunch; Horse-radish, 12s. to 15s. per dozen rolls.

SPITALFIELDS: June 2.—Quotations:—Cabbages, 1s. 6d. to 2s. 6d. per tally; Radishes, 4s. to 5s. do.; Spinach, 1s. to 1s. 6d. per bushel; Peas, 4s. to 5s. do.; Rhubarb, 1s. 6d. to 2s. per dozen; Mint, 2s. do.; Parsley, 1s. do.; Onions, 1s. to 1s. 6d. do.; Beet-root, 1s. 6d. to 2s. per bushel; Cauliflowers, 2s. 6d. to 3s. per dozen; bunch Greens, 1s. 6d. to 2s. do.; Asparagus, 1s. 6d. per bundle; Gooseberries, 4s. to 5s. per half-sieve; Leeks, 1s. to 1s. 6d. per dozen.

STRATFORD: June 2.—Quotations:—Cabbages, 1s. to 3s. per tally; Greens, 6d. to 1s. per bag; do., 1s. to 2s. per dozen bunches; Cauliflowers, 1s. to 2s. 3d. per dozen; do., 5s. to 11s. per tally; Beetroot, 4d. to 8d. per dozen; Horseradish, 2s. to 2s. 6d. per bundle; Parsley, 1s. to 1s. 3d. per dozen; Rhubarb, 1s. 6d. to 2s. 3d. per dozen bunches; Leeks, 1s. 6d. to 2s. do.; Spring Onions, 1s. to 1s. 6d. do.; Salad, 1s. 6d. to 2s. per dozen punnets; frame Cucumbers, 1s. 6d. to 3s. 3d. per dozen; Asparagus, 1s. to 2s. per 100 heads; Turnips, 2s. to 3s. per dozen bunches; Carrots, bunched, 5s. to 5s. do.; Mangels, 12s. to 18s. per ton; Onions, Egyptian, 9s. to 10s. do.; Apples, Tasmanian, 7s. 6d. to 12s. per caso.

FARRINGTON: June 4.—Quotations:—Peas, 4s. per bushel; Leeks, 2s. per dozen; Summer Cabbages, 4s. per tally; Spinach, 2s. per bushel; Lettuce, 10d. per score; Endive, 2s. per dozen; Mint, 2s. per dozen bunches Horseradish,

1s. 6d. per round; Parsley, 1s. 6d. per dozen bunches; Tomatoes, English, 9s. 6d. per dozen pounds; Jersey, do., 7s. do.; Cucumbers, 3s. per dozen; Pine-apples, 2s. to 3s. each (6 lb.); Cherries, 7s. to 9s. per bushel; Tasmanian, French Crabs, Sturmer Pippins, &c., 10s. to 12s. per caso.

POTATOS.

BOROUGH: June 2.—Quotations:—New, 8s. to 12s. per cwt.; Lisbon, 4s. to 5s. per case; Old, 35s. to 75s. per ton.

SPITALFIELDS: June 2.—Quotations:—Old: Highlands, 40s. to 60s.; Blacklands, 25s. to 40s.; New: Jersey Flukes, 9s. to 10s.; Myatt's, 8s. 6d. to 9s.; Cherbourg, 7s. to 8s. per cwt.

STRATFORD: June 2.—Quotations:—New: Jersey Kidneys, 9s. to 10s.; do. Flukes, 10s. to 11s.; Cherbourg, 7s. 6d. to 8s.; St. Malo Flukes, 8s. 6d. to 9s. 6d.; Lisbon, 5s. to 5s. 6d.; Canary, 7s. to 9s. per cwt. Old: Dark soil Bruces, 15s. to 20s.; light soil do., 17s. 6d. to 40s.; Reading Giants, 17s. 6d. to 40s.; Sutton's Abundance, 17s. 6d. to 40s.; Magnums, 17s. 6d. to 40s. per ton.

LONDON MARKET AVERAGES: June 3.—Quotations:—New: Jersey Flukes, 10s. to 11s.; do. Kidneys, 9s. to 10s.; Cherbourg, 8s. to 9s. per cwt.; Lisbon, 3s. 3d. to 3s. 9d. per box. Old: Dunbar Bruce, 60s. to 80s.; do. Main Crop, 60s. to 80s.; Imperators, 35s. to 45s.; Magnums, 20s. to 30s. per ton.

HAY.

Averages.—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, prime, 65s. to 87s.; inferior, 38s. to 60s.; Hay, best, 60s. to 85s.; inferior, 30s. to 55s.; mixture, 60s. to 84s.; and straw, 24s. to 40s. per load.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.) for the week ending May 30, and for the corresponding period last year:—1896: Wheat, 25s. 4d.; Barley, 21s. 5d.; Oats, 14s. 10d. 1895: Wheat, 24s. 5d.; Barley, 19s. 4d.; and Oats, 15s. 10d.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; \*Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending May 30, is furnished from the Meteorological Office:—

"The weather was again very fine and dry in all parts of the kingdom, the only rain experienced being slight amounts at some of our northern stations.

"The temperature continued above the mean in nearly all districts, especially in Scotland and the south of Ireland, but only just equalled it in 'England, N.E.,' while in 'England, E.' it was 1° below the normal. The highest of the maxima occurred, as a rule, on the 29th, and ranged from 78° in 'England, S.' and the 'Midland Counties,' and 77° in 'Scotland, E.' and 'England, E. and S.W.,' to 67° in 'England, N.W.,' and 65° in the 'Channel Islands.' The lowest of the minima were recorded either on the 25th or 26th, when they ranged from 33° in 'England, S.W.,' and 34° in 'Scotland, E.,' to 41° in 'England, S.,' and to 40° in the 'Channel Islands.'

"The rainfall was entirely absent from by far the greater part of the United Kingdom, but some very slight falls were experienced at some of the northern and north-eastern stations.

"The bright sunshine was deficient in 'England, N.E.,' but abundant over the more western parts of the kingdom. The percentage of the possible duration ranged from 65 to 69 in all the 'grazing districts' excepting 'England, N.W.,' and from 42 to 54 in most other parts of the country; in 'England, N.E.,' however, the percentage was only 23."

FLORISTS' FLOWERS.

PINK HER MAJESTY AS A FORCING VARIETY.

WHEN visiting the Hassocks Nursery of Messrs. W. Balchin & Son at the end of April last, I saw a number of plants of this variety of Pink in full bloom in one of the houses. It is largely grown for its cut blooms, and to obtain good plants cuttings are struck in April, which when well-rooted are potted into 60-sized pots, then planted out in the open to grow, and in the autumn potted on into 32-sized pots, and in early spring brought into flower under glass. There were from ten to twelve large full blooms on each plant, larger and fuller, as well as purer, than when grown in the open ground. One gains some idea of the size to which the blooms of this variety will attain when grown in pots in this way.

THE RANUNCULUS.

My next-door neighbour has a circular bed, the centre of which is occupied by some bright-coloured Ranunculus, mainly self-coloured. Despite the drought and sun, having been planted in rich soil, and well looked after in the matter of water, they have been, and still are, very effective. Some are white, others blush and pink, deepening also to rose; there are shades of yellow, some pale, others deep gold and orange; the scarlet and crimson shades are also very bright, while there is a fair succession of bloom. For late spring decoration and cutting they are of great value, and it is well this fact be noted, as the Ranunculus is not so much grown in gardens as it ought to be. There is no difficulty in obtaining roots of the varieties above-mentioned, as they are largely imported from Holland in a dry state at the end of the summer, and they will keep for two or three years if not planted, and still retain their vitality. It is not necessary they should be a long time in the ground, as the roots may be planted from February till April, and they will bloom in June. My neighbour planted hers with the Hyacinths early in November, and as the bed in which they are growing is an elevated one, they were not harmed during the winter months. We are now dependent upon the Dutch growers for the supplies of roots of this charming flower, though time was when collections were grown and seedlings raised in this country, and named and sold. The last catalogue of such plants was no doubt that of Mr. Carey Tyso, of Wallingford, Berks, who succeeded to this business established by his father, the Rev. Mr. Tyso, who was a Nonconformist minister. Here and there about the country a few of the finer type of exhibition Ranunculus are

still grown, and a class is found for them in some schedules of prizes—in that of the Commemoration show of the Royal Oxfordshire Horticultural Society, to wit. There is no doubt that we originally derived the flower from the Dutch, and it is to the Dutch we look for a supply in the present day. When planted, the small, dry, claw-like roots imbibe moisture, and largely increase in size; therefore, they should be placed deep enough below it so as not to be thrown up above the soil in the act of swelling. A mulch of manure after the plants have put forth their leaves is of great value, and water is necessary during time of drought. The old growers recommended that the roots should be lifted as soon as the leaves begin to turn yellow, then carefully dried and put away until required for planting. *R. D.*

**ASTER LEAVES:** *C. Wolley Dod.* The cuticle is separated from the subjacent tissue, and in a very strange condition. We should like to see it again later on, as it is very puzzling. Cells concatenate, with granules of chlorophyll, and no mycelium. *M. C. C.*

**CARNATIONS:** *X. P.* The leaves have small translucent spots which are like those described as characteristic of the presence of Bacteria. We have not the time nor the means of ascertaining whether this supposition is correct. An account has been recently published by Prof. J. C. Arthur and H. L. Bolley in the *Bulletin of the Purdue University Experiment Station* for March. Application to the Director of the Station at La Fayette, Indiana, together with a few stamps for the postage of the report, would probably be favourably entertained.

**COLD VINERY AND MILDEW:** *F. W.* The conditions are just such as favour the spread of mildew on the Vines, *Peronospora viticola*; and once the mould eizes on the leaves, young shoots, and bunches, it is too late to do anything that will save the crop, although there are antidotes for mildew, one of which is flowers-of-sulphur you have been using, and the Bordeaux Mixture. There are certain cultural methods which, if properly carried out, hinder the growth of mildew on Vines. These consist in maintaining a warm buoyant atmosphere, not admitting much, if any, ventilation by the lower lights of the vinery, having plenty of ammonical vapour in the air by sprinkling water in which Peruvian guano is mixed, on the border, floors, &c., or by maintaining a mass of fermenting stable-litter and tree leaves, and placing numerous pans about the vinery filled with flowers-of-sulphur and water.

**GLADIOLUS:** *E. D. T.* It appears that the cross of *Gladiolus trimaculatus* and the white form of *G. Colvillei* did not take, but there was reversion to the coloured form in the seedlings. It is too near *G. Colvillei* to name in any case.

**NAMES OF PLANTS:** *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*C. W. D.* *Pyrus lobata* (*Mespilus grandiflora*).—*W. W.* *Collomia coccinea*.—*H. S. T.* *Pyrus intermedia*.—*Oncid.* 1, *Bifrenaria inodora*; 2, *Cattleya Mossie*; 3, *Saxifraga hypnoides*; 4, *Anthericum lineare variegatum*.—*W. W.* Your *Cattleya Mossie* is an approach to *C. Mossie Hardyana*, but not nearly so handsome. Yours may be constant, but possibly it may not have the purple marks on the sepals and petals next season.—*H. T. 1.* *Ornithogalum thyrsoides*; 2, *Medicago echinatus*, the Calvary Clover, so far as we can tell, without the fruit; 3, *Oxalis Bowiei*.—*J. R.* An exceptionally fine *Cattleya Mossie*, of the richest colour of any we have seen this season. We are sorry your name was misspelt, but the fault was not entirely with the printer.

**NOBLE STRAWBERRY:** *C. Herrin.* The fruits got damaged in transit, but it was easily seen that they were very large and ripe.

**PEACH LEAVES:** *One in Doubt.* There is no fungoid disease which we can detect in the Peach and Nectarine leaves. The only mould is a saprophyte on some of the dead tissues, which is very slight, and has nothing to do with the spots. The spots

have the appearance of scorching or burns, produced by some external conditions. The leaves themselves furnish no clue to the mystery. *M. C. C.*

**POTATO-LEAF DISEASE:** *Z. K. B.* We have received from Cape Town some leaves of Potato which are affected with numerous nearly orbicular discoloured spots, about a quarter of an inch in diameter, or less. These spots are mostly brownish, but sometimes grey, usually marked with dark concentric lines, but without distinct orifices, or imbedded perithecia. It is always difficult to manipulate leaves which are suddenly dried, as they become so tender and brittle in the process, that what could readily be determined with living tissues becomes almost impossible. In this case we did not succeed in discovering any mycelium, but the cells are filled with a gummy brown matter of an ordinary kind. We failed also in detecting any fungoid spores, after repeated examinations, except in the very oldest and most decayed leaf, two or three Macrosporium spores, and one or two globose bodies, resembling young Pythium spores. Altogether, notwithstanding that the spots are not unlike those caused by some kinds of fungi, we could find no evidence that they are so originated. Our correspondent writes that the tubers are not affected perceptibly by this spotting of the leaves; hence we are disposed to consider the case one which should cause no alarm. It is easier to say what it is not than what it is, so that we can affirm it to have no relation to the common Potato disease, or to any species of destructive Ramularia or Gloeosporium, but simply a case of leaf-spotting, which, after all, may be dependent upon local surroundings which we are unable to appreciate. *M. C. C.*

**TOMATO:** *C. B. W. & Co.* Repeatedly figured and described. It is too late to do anything but destroy the plants. Had you, early in the season, sprayed with Bordeaux Mixture, carefully prepared and judiciously used, you would have been spared much of this mischief. Aster leaves not found in the box.—*R. Neustead.* There is no fungus disease in the stems of Tomato. Rotting seems to be caused by an excess of moisture. *M. C. C.*

**VINERY AND STOVE TEMPERATURE AFTER CLOSING:** *M. K. G.* No harm would result if the warmth reached 90° with sunheat; but, it is essential that the damping down of all surfaces—not necessarily that of the foliage of the Vines and plants—should be well done immediately after shutting up the houses. This high degree of temperature need not be maintained for many hours, and in the ordinary course, with no warmth in the heating apparatus, it will decrease to 75° by 8 o'clock P.M., and at that hour or earlier a small amount of ventilation should be afforded at the top of the houses, which may be left on all night, except in cold and boisterous weather, when it may be reduced between 9 and 10 o'clock. The morning temperature in a vinery, unless it be an early one, should not rise higher than 80° for Muscats and similar varieties of Grapes; and 75° for Black Hamburg, Sweetwater, Frontignans, &c., before air is afforded by opening the upper ventilators, more or less according to external conditions; and the same will hold good for an ordinary plant stove.

**CONTINUED INCREASE** in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

**IMPORTANT TO ADVERTISERS.**—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper, increased to the extent of more than 90 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is prescribed for reference in all the principal Libraries.

TRADE MARK, No. 14,629.

AND FOR ALL GLASS STRUCTURES THAT REQUIRE SHADING. It combines efficiency with appearance, convenience with economy, and its effects are lasting, while it is easily removed when necessary with hot water. It can be supplied either pale green or grey. The public are warned against spurious imitations which are offered them, through the success obtained for many years by Elliott's "Summer Cloud" Shading, and they should see that in ordering they get the "Summer Cloud," which is the only original and bona fide article, with the Trade Mark on each packet. Sold in pkts., 1s. each, and in bags, 7 lb., 10s. 6d.; 14 lb. 20s.

To be had of the SEED and NURSERY TRADE generally. Manufacturers: **CORRY AND CO., Ltd.**, London.

## NICOTINE SOAP

Insecticide for Washing, Dipping, or Syringing Plants.

(Introduced 1870.)

MANUFACTURED IN BOND, FREE OF DUTY. GREATLY IMPROVED IN MAKE and STRENGTH. Prices Largely Reduced.

Nothing can equal it for the eradication of all insect pests that affect plants, and it is a boon to fruit-growers. It thoroughly cleanses without the slightest injury to foliage or young fruit.

In stone bottles, the original size, 1s., 2s. 6d., 5s. In drums, 12lb., 13s. 6d.; 28lb., 25s.; 56lb., 50s.

To be had of all Seedsmen and Nurserymen.

MANUFACTURERS—

**CORRY & CO., Ltd., LONDON.**

**ROBERT WARNER & CO'S**  
NEW PATENT  
**WINDMILLS.**

Saves Coal, Pumps Water, Grinds Corn, Cuts Chaff, &c.

Supports can be made in Teak, Iron, or Steel, for Hot Climate. One of Robert Warner & Co.'s Patent Windmills will be erected and worked at the Royal Agri. Show, Leicester.

Prices from £17, including Pump and Timber Supports. May 27, 1893, The Dell, Englefield Green, Surrey. ROBERT WARNER & CO., ENGINEERS, 27, JEWIN CRESCENT, E.C. Dear Sirs,—It affords me much pleasure to inform you that the 25 ft. Annular Sail geared Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully, H. BALLANTINE, Head Gardener to Baron Schröder. R. WARNER & CO. have made and erected a similar Mill and set of Pumps for Lord Northbourne. NUMEROUS OTHER TESTIMONIALS ON APPLICATION TO 27, JEWIN CRESCENT, CRIPPLEGATE, LONDON, E.C. Engineering Works, WALTON-ON-THE-NAZE, ESSEX.

The Success achieved by Exhibitors at past Chrysanthemum and other Shows has clearly demonstrated, by examples staged, that

**THE XL ALL MANURES**

are of the greatest importance to those who wish to have fine blooms and superior fruit.

**XL ALL LIQUID MANURE.**  
1 pint, 1s.; 1 quart, 1s. 6d.; 1 gallon, 3s. 9d.; 4 gallons, 12s. Cheaper in bulk. To be used one part to fifty of water, making the cheapest Plant Food in the market. Read the remarks below of a Champion Grower.

**XL ALL PERFECTLY SOLUBLE MANURE.**

AND SIXPENCE FOR EVERY ADDITIONAL LINE.

If set across two Columns, the lowest charge will be 20s.

If set across three Columns the lowest charge will be 30s. Pages, 28; Half Page, 24 10s.; Column, 43.

**GARDENERS AND OTHERS WANTING SITUATIONS.** 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

**POSITION.**—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

**NOTICE TO ADVERTISERS.**—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. G. COVE, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

ESTABLISHED 1851.

# SHANKS'S LAWN MOWERS

THE ONLY ONES FITTED WITH PATENT AXLE SPRINGS.

STANDARD GEAR MACHINE,  
WITH PATENT AXLE SPRINGS.

HAND MACHINES.

Made in all Sizes, to cut from 6 in. to 24 in. wide.

STANDARD CHAIN MACHINE,  
WITH PATENT AXLE SPRINGS.

TESTIMONIALS

Lord's Cricket Ground, London, June 15, 1894.  
I have used your Lawn Mowers for over twenty years, and have no fault to find with them. I consider them the best in the market, and they are the only machines we use here. The addition of the springs to our 48-inch Mower is a great improvement, and the Machine works with great ease and smoothness. I consider you have made a good hit. Yours truly, (Signed), PERCY FEAROE, Ground Supt.

Surrey County Cricket Club, Kennington Oval, London, April 3, 1894.  
I have given our large Machine that you fitted with your Patent Springs a fair trial. I am very pleased indeed with the springs; they do away with all jar and shake on any ground, and prove to be all you claim for them.—Yours truly, (Signed), SAMUEL APTED.

HORSE MACHINE,  
WITH PATENT AXLE SPRINGS.

TESTIMONIALS.

Hurlingham Club, Fulham, June 13, 1895.  
I have used your Lawn Mowers for over twenty years, and find them the best. The addition of springs is a very great improvement. (Signed), WM. SUTHERLAND, Head Gardener.

Ranelagh Club, Barnes, S.W., October 13, 1895.  
On behalf of the Committee, I have pleasure in stating that your Mowing Machines, fitted with Patent Steel Springs, have been used for six months on our Golf Links and Polo Grounds, and have given the greatest satisfaction. The springs, in our opinion, are a great improvement in Lawn Mowers.—Yours faithfully, (Signed), HENRY E. RIDLEY, Assistant Secretary.

## HORSE, PONY, & DONKEY MOWERS { For Golf Courses, Cricket Grounds, Private Lawns, &c.

"THE BRITANNIA,"  
A Perfect Side-Wheel Mower.

"THE CALEDONIA,"  
Light Roller Machine,  
WITH PATENT AXLE SPRINGS.

TESTIMONIALS.  
(PER BEN BEID AND CO., of ABERDEEN.)  
The "CALEDONIA" Lawn Mower made by Shanks, Arbroath, is one of the best I have ever tried. I got a 14-inch size, and it is undoubtedly the lightest and sweetest-working Mower in my collection.—(Signed) JOHN M. TROUP, Gardener to H.M. the Queen, Balmoral.  
58, Dawson Street, Dublin, Nov. 1, 1894.  
Referring to the Horse Machine supplied last season, Mr. J. Robertson, Land Steward to the Right Hon. Earl Fitzwilliam, writes us as follows:—I have great pleasure in stating that the Horse Lawn Mower has done its work exceedingly well. The Patent Springs fitted to the main axle are a great advantage, especially when the ground is uneven, as they prevent jolting and vibration of the machine.—Yours truly, (Signed), W. DRUMMOND AND SONS.

## HAND, HORSE, OR PONY ROLLERS, FOR GARDENS, PARKS, GOLF GREENS, &c.

## SALES BY AUCTION.

Friday Next, June 19.

**CATTLEYA LUDEMANNIANA**, free-flowering variety.  
**CATTLEYA MOSSILE**, a distinct type, from a new district.

**MESSRS. PROTHEROE AND MORRIS** will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, June 19, at half-past 12 o'clock an importation, just to hand in splendid condition, of **CATTLEYA LUDEMANNIANA**, from a new district. This is one of the most beautiful Cattleyas known, and is evidently a very free-flowering type, nearly every growth showing an old flower-spikes. Many of the plants have a very distinct appearance, and some remarkable varieties may be looked for.

Also from a new location a special consignment of **CATTLEYA MOSSILE**, showing much diversity, many of the plants being very distinct, and may be yielded some remarkable varieties including the white form, which collector writes, will doubtless be found among them. With them will be offered a batch of an exceedingly DWARF FREE-FLOWERING TYPE OF **CATTLEYA MOSSILE**. The whole in grand condition.

On view morning of Sale, and Catalogues had,

Friday Next, June 19.

By order of Messrs. F. Sander & Co., St. Albans.  
**SALE OF ORCHIDS**, including a Consignment of very rare ORCHIDS from Equatorial Africa (probably all are new to cultivation), consisting of *Polestachya cultrata*, *Eranthus pectinatus*, *Angraecum cucullatum*, *Liparis flavescens*, *Angraecum striatum*, *Eranthus arachnites*, *Angraecum gladiolifolium*, *Bulbophyllum species*, *Liparis species*, *Cryptopus elatus*, *Angraecum parvulum*, *Bulbophyllum prismaticum*, *Bulbophyllum nutans*, *Eulophia species* (?), *Bulbophyllum clavatum*, *Liparis gregoria*, *Angraecum carphorum*, *Phaius villosus*, *Phaius species*, *Calanthe sylvatica*, *Liparis purpurascens*, *Latyrium amoenum*, *Cynorebis fastigiata*, *Angraecum inasperum*, *Angraecum caulescens*, *Angraecum ramosum*, and *Peristylus spiralis*. All offered as received with Collector's labels attached.

**DENDROBIUM NOBILE**, Lang Tang variety, a grand consignment; many large plants are included, all are in best condition. No other district has yielded such splendid varieties, and new and peerless forms may be looked for among the plants offered.

**DENDROBIUM ALBO-SANGUINEUM**.—For the size of the bulbs, the largest-flowered Dendrobium known. Most showy and useful for all exhibition and decorative purposes.

**DENDROBIUM CRASSINODE BARBERIANUM TYPE**, abounding in the rich-coloured purplish forms so much admired.

**DENDROBIUM DEVONIUM**.—A most effective Dendrobium. The plants offered were found growing near Dendrobium Pierardii, and possibly the two species may have crossed, and the product be among many plants appear intermediate between the two.

**DENDROBIUM FORMOSUM GIGANTEUM**.—The true large-flowered form, than which no better florists' flower exist. The plants are plump and vigorous-looking.

**CYPRIPEDIUM INSIGNE MONTANUM** Sandersi Section.—A splendid consignment. The wonderful varieties already obtained will, we are confident, again be duplicated, perhaps surpassed; also strong imported bulbs of an

**ETCHARIS SPECIES**, probably *E. candida* or *E. grandiflora* var., and plump bulbs of **CRINUM SANDERIANUM**.  
Also, a **DENDROBIUM SPECIES**, sent home as *D. sanguinolentum*, but quite distinct from that species, &c.  
Also, 2 Volumes of Veitch's *Orchidaceous Manual*. (Another Property.)

**MESSRS. PROTHEROE AND MORRIS** will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, June 19, at half-past 12 o'clock.  
On view morning of Sale, and Catalogues had.

Putney Heath.

Important to Gentlemen, Nurserymen, Florists, and others.—**CLEARANCE SALE** of the whole of the **STOVE** and **GREENHOUSE PLANTS** and **GARDEN UTENSILS**. By order of Mrs. Venables, in consequence of the Residence having been let.

**MESSRS. PROTHEROE AND MORRIS** will SELL by AUCTION, on the Premises, "Hollywood," Putney Heath (Tibbet's Corner), one mile from Putney Station, S. W. Railway, and one mile from Southfields, District Railway, on THURSDAY NEXT, June 18, at Half-past Twelve o'clock, the whole of the well-grown **STOVE** and **GREENHOUSE PLANTS**, 70 Orchids, 100 Camellias and Azaleas, various size plants, together with *Pelargoniums*, *Fuchsias*, *Geraniums*, best show varieties; 50 Palms; Garden Tools, Wheelbarrow, Ladders, Hand-barrow, Corn-bin, Green's Mowing-Machine, 10 Glazed Handlights, Garden Seats, 300 *Chrysanthemums*, &c.

May be viewed the day prior and morning of Sale. Catalogues may be had of Mr. J. BATTEN, the Gardener, on the premises; and of the Auctioneers, 67 and 68, Cheapside, E.O.

Cholsey, Berks.

Almost adjoining Cholsey Station, and within 2 miles of the Market Town of Wallingford.  
A highly desirable and valuable **FREEHOLD PROPERTY**, comprising a well-stocked and very productive **NURSERY**, doing a capital trade, an extensive range of five Span-roof Greenhouses, well stocked with Vines, Tomatoes, Apricots, Cucumbers, &c.; a Lean-to Forcing-pit, Potting-shed, Mushroom-house, &c.; brick-built and tiled Dwelling-house, timber-built and slated Bungalow, modern range of Stabling, and small set of Farm Buildings. The property, which comprises an entire area of about 9 Acres, thereby affording full scope for the extension of the present business of a Nurseryman and Florist, and possessing, in addition, several eligible Building Sites ripe for immediate development, will be

SOLD BY AUCTION, as a Going Concern, by

**MESSRS. FRANKLIN AND GALE**, at the Town Hall, Wallingford, on FRIDAY, June 28, 1896, at 4 o'clock punctually, in One Lot, with possession on completion.

Particulars and Conditions of Sale can be obtained of **GEORGE F. SLADE**, Esq., Solicitor, Wallingford; or of the Auctioneers, Market Place, Wallingford, Berks.

Central Auction Mart, Bristol.

**THE ENTIRE COLLECTION OF ESTABLISHED GROHDS** formed by T. G. Binney, Esq., Clifton, including:—*Dendrobium nobile nobiliss*, 6 young growths; *D. Wardianum* Lowii, gigantic mass, 16 young growths; *Vanda cœrulea*, large plant, and superb variety; unfowered *Vandas* and *Cattleyas*, probably new; *Coleogyne cristata*, 3 large masses; *Acridia*, *Angraecum*, *Phalaenopsis*, *Gonotoglossum*, *Oncidium*, *Cypripedium*, &c., in great variety. Also—

**IMPORTED ORCHIDS**, including new and rare species, from Messrs. W. L. Lewis & Co. and Mr. J. W. Moore. **ORCHIDS IN FLOWER** or **BUD**, &c.

**MESSRS. DUROSE SUTTON AND CO.** will SELL the above by AUCTION, on THURSDAY NEXT, JUNE 18, 1896, at 11 o'clock precisely.

Catalogues of the Horticultural Auctioneers and Valuers, 1, Queen Anne Buildings, Bristol; and at Frome, Somerset.

 R. AND G. CUTHBERT, Seed, Bulb, and Plant Merchants, Southgate, N. Established 1797.

**MUNGO CHAPMAN**, late of Easter Duddington Lodge, Mid-Lothian, begs to intimate to his friends and acquaintances that he retires from his present situation on the 20th of the present month. He has arranged to reside at St. Ninians, near Stirling, where he intends to commence the Cultivation and Sale of Hardy Plants on his own account.

With the experience gained during twenty-four years in the management of one of the most choice private collections of plants to be found in the British Isles—that of the late Charles Jenner, Esq.—Mr. Chapman can confidently undertake to supply what is select and true to name of the most suitable plants for Borders and Rock-work.

He hopes to be able soon to issue a Plant Catalogue, from which customers may make their own selection. In the interval, he will be fully employed in getting up Stock.

May 19, 1896.

## FERNS A SPECIALITY.

We have an immense stock of all kinds of Ferns, Stone, Green-house, Filmy, Hardy Exotic, and British, including many very beautiful varieties rarely seen, but which ought to be more generally grown. Catalogue free on application.

# LINDEN'S SUPERB NOVELTIES

For 1896.

Just Sent Out for the First Time.

With some of them we gained the FIRST PRIZE in a COMPETITION OPEN TO THE WORLD, held at the GREAT INTERNATIONAL EXHIBITION OF PARIS, 1895. DIPLOMA OF HONOUR AT DRESDEN IN 1896.

Many of them have been awarded FIRST CLASS CERTIFICATES and AWARDS OF MERIT by the Royal Horticultural Society of Great Britain. They also gained the SILVER CUP at the GREAT TEMPLE SHOW IN 1894, and the SILVER-GILT FLORA MEDAL IN 1896.

## A Descriptive CATALOGUE of Our NOVELTIES & NEW ORCHIDS

HAS JUST BEEN ISSUED.

## THE Gardeners' Chronicle.

SATURDAY, JUNE 13, 1896.

### THE ROSE SEASON.

ONCE more has disappointment come to all those who have to do with the soil in our variable climate; a winter of unusual mildness had done much to cheer the growers of the Rose, as well as the farmer, and when the time for the pruning-knife drew on, it was evident that there would be but little dead or injured wood to cut out. It was fortunate the winter was so mild, as the autumn had not been a particularly good one for ripening the wood, and if we had had anything like the severe weather experienced the two previous winters, it would have gone hard with many of our plants, but as it was I suppose there have been few seasons in which our Roses looked better at the time of pruning; but two rainless months in April and May greatly changed the character of the outlook, and although we did not experience, in many places at any rate, those frosts which come to us about May 20, and no where anything like we had in 1894, yet the long spell of cold northerly and north-easterly winds and a dry atmosphere very much altered the appearance of things. Insect pests multiplied rapidly, and now as I look round upon my own Roses, I see more signs of aphid on them than I have had for the last two years. I have not visited many Rose gardens as yet, but I find the same story where I have been, and also from many correspondents. Of course, the cry has been—we all want rain; and as Mr. Symons tells us that the drought is over, and we have experienced in many places refreshing showers, it is to be hoped that the remainder of the month may do much to remedy the evils of the previous weeks. To what an extent the drought has gone is evident from Mr. Symons' letter, in which he says that on June 3 there was more rain in three-quarters of an hour in London than there had been during the two previous months, April and May. Where a small number of Roses is grown these evils can be remedied if there be a good supply of water, though nothing can make up for the want of the genial temperature in which Roses rejoice. The showers with which we have been visited during the first week in June have no doubt been most beneficial, except in such places as Lincoln, where the devastation created by the almost tropical downpour must have affected the Roses as well as other crops injuriously; and a great deal will depend upon the weather of the next three weeks. The single Roses have already begun to display their beauty, so that I fear that there will be but few of them left for the show that takes place at the Crystal Palace on July 4. It is to the contests which take

place during the last few days of June and the month of July on which the thoughts of rosarians will now be fixed, for let people decry them as they may, I do not think that the enthusiastic culture which now exists would long prevail if they were done away with. I am not, and have never been, an exhibitor, but when I think of good Roses, my thoughts somehow or other gravitate towards the exhibition-table, and especially towards the great Rose tournament at the Crystal Palace.

The National Rose Society's shows are, as usual, three in number, the first of these takes place on the 24th instant at Reading, and a season like this ought to bring together in so central a position a large number of exhibitors. The *prix d'honneur* will, no doubt, be the cup offered by Messrs. Sutton & Sons for the best box of twelve to be exhibited by amateurs, and which will, no doubt, create a keen competition. The celebrated Reading firm has had it designed and manufactured on purpose. The experience of the Queen's cup at Windsor shows how very difficult it is to forecast who is to be the winner. There were three or four growers who were the special favourites, but to none of them did it fall, but it was taken by an outsider; and so we may leave Messrs. Sutton's cup in the same uncertainty, and I think he would be a very bold prophet who would fix upon the winner. But the show of the season is, of course, the Metropolitan one held at the Crystal Palace, and there are many circumstances which combine to make us look hopeful for a grand show. In the first place, I anticipate a very sharp contest for the Nurserymen's Trophy; this class has always been the great one of the show, and its interest will be increased by the fact that Messrs. Harkness & Sons have now their nursery at Hitchin from which to cut their Roses, as well as at Bedale; while Messrs. Alex. Dickson & Sons will be able from their new ground at Ledbury to enter into the contest without having to cross the Channel to do so. The place has been made classical ground for the lovers of Roses by Mr. W. J. Grant, who formerly occupied it—we can all recollect the fine Roses he brought up from there; and Messrs. Dicksons will now be another firm with which the older exhibitors will have to count. Then I believe Mr. George Mount intends to be an exhibitor in this class, and if he is as successful in the culture of his outdoor Roses as he has been with those under glass, he will be a formidable antagonist.

Another interesting feature of the exhibition will be the contest for new home-raised Roses for prizes offered by a well-known amateur; he has in the first place offered substantial prizes for a stand of Roses raised by Messrs. Dickson, Newtownards, both in the nurserymen and amateur sections; and in the second place, he has offered prizes for a stand of Roses raised and sent out by English nurserymen—both of these ought to be very interesting exhibits.

Lord Penzance's prize for garden Roses is another that ought to bring together stands of much interest; though I fear both single Roses and those Sweetbriar hybrids raised by himself, will have almost passed over before the exhibition-day.

I do not at present anticipate much change amongst amateurs. I have not heard of any new exhibitors coming forward, though I have heard that some of those who have already exhibited are about to take a higher place. Garden Roses, especially in their decorative aspect, have received more attention from the Society; and it is to be hoped that the encouragement given to them will be better responded to by exhibitors, although I am aware how much trouble is involved in setting up a stand for display, especially when the same exhibitor is contending in the other classes.

It is a "far cry" to Ulverston, where the North Lonsdale Rose Society has made arrangements for receiving the National Rose Society for its northern exhibition; it is a charming part of the country, close to the Lake district, and the North-Western service of trains is so good and convenient that although it is six hours from London it is reached more easily than some places not half the distance. Here, probably,

the most coveted prize is that offered by Mr. Victor Caveudish, and the Veitch Memorial Prize, offered by the trustees of that fund. The lateness of the fixture, and the distance will probably keep most of the Southern growers, especially amateurs, at home, and unfortunately the number of amateurs in the North has much diminished of late years; but unquestionably loyalty to the National Rose Society will induce many to come who but for that would stay away.

Another matter which will give additional interest to the exhibitions of the present year is, that the committee of the National Rose Society is about to publish a supplement to their catalogue of Roses, and that as there are several Roses whose claims to be put on the new list have been brought before the committee, Rose-growers and exhibitors have been particularly requested to look out for these flowers, and to take notes of their merits or demerits, so that when at the close of the season the matter shall be again brought before the committee, a considerable mass of information will be at their disposal; and they will be able thus to include such flowers as meet with general approval, and to exclude others which have, perhaps, had one or two zealous advocates, but which would not stand the test of more general criticism. The committee will thus feel that they have done their best to secure the interests of Rose-growers in general. *Will Rose.*

FIG. 122. MODEL OF THE OLD FLOREST'S PANSY.

## ORCHID NOTES AND GLEANINGS.

### CYPRIPEDIUM CALLOSUM SANDERÆ.

THIS, in my opinion, is the finest *Cypripedium* in cultivation, taking in all the species and crosses that have been submitted before public notice. It received a First-class Certificate at the Temple Show of 1894, and was noticed in your report on pp. 660, col. A, and 663, col. C. A plant of it is now in flower in the choice collection recently formed of Samuel Greatorex, Esq., West Point, Whalley Range, Manchester (Mr. R. McLeod, gr.), and as it has not been described in detail, I send you the following description of it: dorsal sepal of broadly-ovate form, white ground with bold emerald-green radiating lines from base, with intermediary lines of half the dimensions, and of paler green hue, stopping short in the centre of the sepal. Inferior sepal small, incurved, with three green lines running through it concealed under pouch. Petals of arching outline forming the serpentine beds of *C. Fairriannum*. They are broadly linear, and, from a colour point of view, are each divided into two sets of colours singularly beautiful in this respect. The upper half is an almost indescribable pale green with the edge adorned with four knobs placed at equal distances, and these knobs and the whole margin of the upper line covered with long hoary cilia; the lower half is clear white ground with five parallel lines of that lovely pale green above noticed, sharp and decided, stopping short within half-an-inch of the extremity, the tips being white with a shade of green through them. The labellum is yellowish-green, both pouch and lobes similar, and the surface as if varnished. The staminate is equally beautiful, the outline being

reniform, greenish towards the convolute lobes, and whitish with a green stripe very near the margin. Peduncle short and hairy. *J. A.*

### A REMARKABLE BULBOPHYLLUM.

In the collection of botanical Orchids belonging to the Honble. Walter Rothschild, at Tring Park, an extraordinary *Bulbophyllum*, as yet unidentified, is in flower. The pseudo-bulbs are long and slender, and the foliage is handsome. The flowers, which are very remarkable, are about 3 inches across, firm in texture, and handsome enough to arrest even the attention of those who say that they care not for such plants. In colour the flowers are yellow, faintly tinged with purple, and the large, showy, hinged lip, which moves upwards and downwards with every alteration in the position of the flower, no matter how slight, is of a rich crimson-purple. It may be classed with the showiest members of the genus. Also among other *Bulbophyllums* and *Cirrhopetalums* in flower in the same house, are the handsome coppery-yellow *C. Mastersianum*, the chrome-yellow *C. O'Brienianum*, the handsome *C. Colletii*, *C. pulchrum*, *C. elegantulum*, the elegant *C. fimbriatum*, two forms of *C. picturatum*, the one almost wholly greenish-yellow, and the other dark purple. Among the *Bulbophyllums*, *B. Dearei* and *B. Lobbi* are two of the more striking. Of other rare and noteworthy subjects in bloom we may note the pretty *Chondrorhyncha Chestertonii*, which here blooms almost the whole year; *Gongora scaphephorus*, a remarkable and rare species; *Polycycnis muscifera*, with its elegant sprays of insect-like flowers, which fill the house with their fragrance; *Eria obliqua*, *E. crassicaulis*, and other species of *Eria*; *Stenoglossis longifolia*, the salmon-tinted *Cœlogyne tomentosa*, and the new and showy *C. Micholitzii*; several species of *Spathoglottis*, which here thrive and bloom remarkably well; some old cultivated plants of *Epidendrum bicornutum*, and a large number of *Masdevallias*, *Pleurothallis*, *Restrepias*, *Stelis*, &c., of botanical interest. *J. O'B.*

## A CONTRIBUTION TO THE HISTORY OF PANSIES.

(Continued from p. 684.)

IN the thirties, one of the favourite flowers of the English was the Pansy, which competed with the Rose itself for popular favour. Both distinguished amateurs and talented nurserymen devoted themselves to the cultivation of the Pansy, and gained one success after another. The English horticultural societies offered prizes for the finest flowers. Every nobleman, every owner of an estate wished to have their special collection of Pansies, and the nurserymen, who were well rewarded for their pains, did everything they could to keep alive the interest of the public by constantly producing new varieties. In the middle of the thirties the price for new and good varieties was 5s. a plant, and for specially excellent ones a far higher price was paid; £10 was offered for the seedling of "Metropolitan," and refused.

Those varieties raised from 1820 to 1836 certainly possessed larger and more brilliantly-coloured flowers than their wild ancestors, but as regards the form of the flower no change was made, it being still more or less elongated in the same way as in the wild *Viola tricolor*, L., or *V. lutea*, Huds. During the latter half of the thirties, however, a change took place, as, dating from 1836, the first object of the British Pansy-raisers was to get the flowers as circular as possible (fig. 122). In *The Floricultural Cabinet and Florists' Magazine* of the above-mentioned year, this quality is described as more to be desired than all others, and but a couple of years elapsed before this ideal was attained. The magazine just mentioned of 1838 and 1839 contained several figures representing new varieties of Pansies, and among these we find at least two, viz., *Ne Plus Ultra* and *J. Burley's Lord Durham*, the flowers of which were almost perfectly circular.

In the beginning of the forties the interest for Pansies rose to such a pitch that special horticultural societies were formed solely devoted to this plant.

The Hammersmith Heartsease Society held its first Pansy show in 1841, and continued them for a long course of years. At the present time (1893) it has been succeeded by a society having the same objects in view, called the London Pansy and Viola Society. In 1845 the Scottish Pansy Society was formed in Edinburgh, which has shown such vitality, that from that day till now it has continued its activity with great success.

By these two Pansy societies, formed in the forties, certain demands were made on the Pansy flowers, which were to be complied with before the flower could obtain a prize at the shows. The principal demands were :—

1. The flowers should be circular.
2. The petals should be even, thick, and velvety.
3. The colour should be either uniform (selfs), or else but two (belted flowers).

But besides these, several other requirements were enumerated, and, curious to relate, these demands were fully realised in a large number of varieties raised at that time. Indeed, for about twenty years these show Pansies reigned almost supreme in Britain. All other varieties produced by the Pansy-raisers were discarded and ruthlessly destroyed.

The effects of this partiality in time, of course, became apparent. However interested the British public might be in the charming flowers of the forties, it must at last become evident that the numerous so-called new varieties continually appearing were, in fact, but a constant repetition of the five well-known types.\* The need of a change in this respect began to be more and more obvious.

Salvation then came to this lovely English flower from France and Belgium in the form of an entirely new class of Pansies, viz., the so-called Belgian or fancy Pansies. Here we find just what is wanting in the show Pansy, viz., great variety of colouring, the brilliant colours being prevalent, and a distribution of colour not only according to the old well-known scheme, but also on a number of others that agreeably appeal to our inherent love of beauty.

In the early thirties the English Pansy was introduced into France, and was there cultivated by skilful horticulturists, who took great pains in further improving it. Among these Pansy-raisers let me mention Miellez of Lille, and James Odier, the owner of Bellevue Castle, near Paris. From the latter come the Odier Pansies, remarkable for the enormous development of the blotches on the three lower petals, which is so characteristic of the fancy Pansies of the present day, and specially for those belonging to the Cassier, Bugnot, and Trimardeau classes.

In Belgium they also strove to improve the English Pansies in the thirties, and partly in the same way as in France, without regard to the laws of beauty laid down in England.

The French fancy Pansies were brought before the English public in the early fifties by John Salter, but gained scarcely any approval. By the prejudiced English they were dubbed "French rubbish," and it was only in 1858 to 1860 that the interest of the British public was aroused by a whole series of brilliant French forms of Pansies chiefly imported from the florist previously mentioned, Miellez of Lille.

These fancy Pansies were cultivated by eminent horticulturists in the north of England and southern Scotland, where the centre of the cultivation of Pansies had been removed, in the latter half of the fifties, in consequence of a destructive disease which had laid waste numerous Pansy grounds in southern England. New and splendid forms were now raised in great numbers, more especially by the activity of William Dean of Shipley, and Downie, Laird and Laing of Edinburgh, and in time these Pansies became so general and popular, that in 1871 The Scottish Pansy Society decided to offer prizes for this class of Pansies at their shows. Special rules of beauty were fixed, which the judges had to follow

when considering the several merits of the fancy Pansies on exhibition.

But now—as in former times with the English show Pansies—it happened that the limitations outside which it was deemed there could be no beauty, were far too narrow. The perfectly-circular form of the flowers was still one of the chief demands, the edges of the petals were to be without waviness or unevenness of any kind, and—most remarkable of all—no other Pansies than those provided with large blotches were entitled to a prize as fancy Pansies. This last rule has certainly greatly contributed to the fact that, in spite of their varying colours, the fancy Pansies have a tinge of monotony about them. The large dark blotch is seen everywhere, and in many cases this blotch is so large that it almost covers the entire surface of the flower (fig. 123). The general public has shown broader views in their ideal of beauty; and doubtless this is the cause why the fancy Pansies are being superseded by the far more unassuming but more natural bedding Pansies and the tufted Pansies or Violas.

BEDDING PANSIES.

The bedding Pansies are characterised by flowers of a smaller size, but at the same time they flower

FIG. 123.—A FANCY PANSY (LORENZ).

more richly and longer than the typical fancy Pansies, and have their lower growth and are more branched. By these peculiarities they are specially adapted for the production of numerous flowers, and make particularly pleasing beds, and it is from this fact they have their name. The original bedding Pansies were direct descendants of the fancy Pansies, and, as a general rule, bedding Pansies are but richly flowering, more dwarf-like fancy Pansies.

The tufted Pansies or Violas have essentially another origin. They are derived from the English *Viola lutea*, Huds., as also from the Pyrenean fragrant *V. cornuta*, L., both crossed with garden Pansies. Their characteristics are: a more perennial habit; a tufted growth; smaller flowers which are not circular, and generally spread an agreeable perfume.

Cross-breeding has undoubtedly always played a great rôle in the production of new forms of Pansies, but in most cases without any plan, insects crossing varieties cultivated near each other. The horticulturists have simply made their selection among the numerous forms which have arisen as a result of this crossing performed by Nature herself. The tufted Pansies, on the other hand, have chiefly to thank for their existence Pansy-raisers, who themselves undertook the hybridisation. James Grieve of Edinburgh, in 1862 and 1863, crossed *Viola lutea* from the

Scottish hills with the ordinary show Pansies of that time; and about the same time William Dean began working in a similar way in the north of England. From these and similar hybridisations not a few of the tufted Pansies are derived, more especially those in which yellow is the prevailing colour. *Viola cornuta*, L., has played a still more important part than *V. lutea*. Dating from 1863 it has been used by different Pansy-raisers for crossing with varieties of dark Pansies in particular. Thus, in 1867, Dicksons & Co. of Edinburgh produced the, relatively speaking, large flowering dark purple Vanguard, concerning which it is stated that it is derived from hybridising *V. cornuta*, as female, with a dark purple Pansy as male flower. About this time B. S. Williams of Holloway sent out his noted *Viola cornuta* Perfection, and somewhat later the fragrant Sensation. These and other hybrids of *V. cornuta* were afterwards used for further hybridisation with suitable Pansy varieties; and by these means—more especially thanks to Dicksons & Co. and to Dr. Charles Stuart, of Hillside—a considerable number of new varieties of tufted Pansies were raised in the seventies.

Tufted the last two decades a most interesting kind of tufted Pansy has been raised, viz., the Rayless Violas, which have flowers of but one colour, free from the ordinary dark rays or streaks, whence their name. The first time I find any mention made of them is in 1881, when in *The Garden* W. Robinson related that at Laing's of Stanstead Park Nurseries, he saw two kinds of such Pansies (*Hybrida alba* and *Golden Queen of Spring*). Not until the very last years of the eighties did they become more widely known. Then appeared Charles Stuart's well-known *Violetta*, a very small-flowering almost pure-white fragrant tufted Pansy, the product of a cross between *Viola cornuta*, L., as the female parent, and the Pansy *Blue King* as the male plant. Dr. Stuart lays special stress on the fact that in hybridisation with *V. cornuta* it should be used as the female, and the Pansy chosen for the occasion as the male plant, if a progeny be desired resembling *V. cornuta* as regards perfume and perennial duration. *Violetta* has in turn produced a numerous offspring (among others, the celebrated *Sylvia*), which, together with other rayless tufted Pansies, play an important part in the shows of the Scottish and English Pansy societies.

Besides the species of Violas already mentioned, in very rare cases *Viola calcarata*, L., has been used for the improvement of the Pansy.

From Dicksons & Co., of Edinburgh, a statement has reached me that *Viola stricta* has been used for the same purpose (*Ariel*, *stricta alba*, *Indiana*, &c., are said to be derived from this species; but it is evident that this *Viola stricta* cannot be the *Viola stricta* of the botanists\*).

Dicksons & Co. declare that their *Viola stricta* is an Indian species. In consequence of this statement, I wrote to the author of the *Flora of British India*, Sir Joseph Hooker, concerning the matter, and in reply, he says, "There is certainly no Indian species remotely even allied to the cultivated Pansies."

It has been mentioned above that a double Pansy was known even to Parkinson, the old English writer on horticulture (1629). In the present century double Pansies have now and again made their appearance, among which the most known is probably Good Gracious, a variety which was cultivated largely in Ireland and Great Britain in the middle of our century, and "Lord Waverley" from the Hale Farm Nurseries, near London, in 1876.

Into Germany the English Pansies were introduced during the thirties, but it was not until the fifties and sixties that the German Pansy-raisers began to produce new varieties. As an instance, let me mention Negerfurst, the product in 1861 of careful selection made year after year by C. Schwauecke of Oeschersleben, and Kaiser Wilhelm, introduced about 1872 by Chr. Lorenz of Erfurt. At the present day the German cultivation of Pansies ranks very high.

\* 1. Yellow-ground varieties; 2. White-ground varieties; 3. Yellow selfs; 4. White selfs; 5. Dark selfs.

\* *V. stricta*, Hornem., belongs to the section *Nomimum*.

The northern limits of the Pansy is attained in Norway, where it has been cultivated with perfect success in several places in the arctic region, in East Finmark, at 69° or 70° N. latitude. V. R. Wittrock.

(To be continued.)

### THE AMERICAN SPECIES OF RHAMNUS.

In comparison with Europe, says Professor Green in *Erythra*, to which twenty-three species are credited, North America north of Mexico is not well stocked with Rhamnus, for there are not more than fifteen, four or five of which are of the Atlantic slope, all the rest belonging to the Pacific slope proper; that is, to the narrow strip of territory intervening between the crest of the Cascades and Sierra Nevada and the shores of the Pacific; neither the Great Basin nor the Rocky Mountain region exhibiting any species, excepting at the extreme north, where one of the eastern, *R. alnifolia*, traverses the Continent, and becomes the only one common to both the eastern and western floras of the country. If, then, eastern North America has of this genus three or four endemic species, the much smaller area of the Pacific slope proper has at least three times as many. In California alone the species are distributed upon all altitudes, from the sea-level up to almost 7000 feet; some of them occurring only where the annual rainfall amounts to no more than 4 or 5 inches, others where it amounts to 100 inches or more. They are distributed all along from where the mercury seldom in the coldest winter indicates the freezing-point of water, and snow never falls, up to where zero of Fahrenheit is reached, and snow falls to the depth of 10 feet, or even more. Indeed, so great is the diversity of environment on that narrow strip of the far-western field, that one might with reason expect a greater number of species than have been recognised hitherto. It may be useful to indicate certain natural and easily-recognisable subdivisions of the genus. The names of these and their characters are as follows:—

1. *RHAMNUS* proper.—Leaves thin, deciduous; fruits black; pyrenes thin-walled, indehiscent; seeds with cartilaginous testa, grooved on the back; cotyledons foliaceous, revolute-margined.
2. *FRAXELA*.—Leaves firmer; fruits black; pyrenes thick, indehiscent; seeds with thin testa, not grooved; cotyledons fleshy, plane.
3. *XANTHORHIZANS*.—Leaves coriaceous, evergreen; berries cherry-red; pyrenes crustaceous, promptly dehiscent; seeds with crustaceous testa, deeply grooved or excavated on the back; cotyledons fleshy, strongly curved.

### CHEMICAL COMPOSITION OF THE APRICOT.

FROM analyses made in California it is shown that the Apricot crop draws upon the fertility of the soil as follows: Each ton of fruit takes from the soil 5 lb. of nitrogen, and 10·6 lb. of ash.

In analyses of several varieties it was found that the Bleuheim variety contained the most ash, and the Pearl variety the least. Naturally the pit or stone contains more ash than the fresh flesh, but the difference is much smaller than one would be apt to think. The average amount of ash in the flesh alone was found to be 10 lb. to the ton, and the ash of the fresh pits alone 14 lb. to the ton. An important fact in this connection is that nearly one-half of the total ash ingredients consist of potash.

A ton of Apricots will carry off from the soil 4·3 lb. of potash, and a crop of 15 tons per acre will remove a total of 64½ lb. of potash. It also takes away 21·4 lb. of phosphoric acid and 38·7 lb. of nitrogen. The ash of the flesh is exceedingly rich in potash, containing 58·6 per cent., while the pits have but 11 per cent. It is the constituent phosphoric acid that the pits more especially take up, the ash having 43·8 per cent. of this valuable ingredient. The Apricot fruit also requires much magnesia and iron to build up its tissues.

The flesh of the Apricot constitutes about 94 per cent. of the total weight, and the pit but 6 per cent., according to the examination of a half-dozen varieties made at the Californian Experiment Station. An examination of nine varieties at the Arizona Experiment Station resulted in finding an average of 6·2 per cent. of the total weight of the fruit to be

pit. The variety having the smallest ratio of pit to total weight of fruit was the Kaisha, of which variety but 5·2 per cent. was pit. The largest weight of pit was found in the Breda variety, in which 8·1 per cent. of the total weight was pit. The Apricot is a very juicy fruit, the flesh containing 87 per cent. of juice to but 13 per cent. of fibre. The amount of juice varies with different varieties from 80 to 90 per cent. The juice of the Apricot contains about 13 per cent. of sugar, the flesh including juice and fibre or cellulose about 12 per cent., and the whole fruit, including pit, about 11 per cent., showing that there is very little sugar in the fibre and pits.

The Apricot has some nutritive value as human food, ranking among the best fruits in this respect. In the edible portion of the fruit there is 1·2 per cent. of albumineids. This constituent is found to be very variable according to investigations made at Berkeley Experiment Station, a minimum of 0·84 per cent., and a maximum of 1·37 per cent. of albumineids was obtained. J. J. Willis, *Harpden*.

### SHIRENEWTON HALL, MONMOUTHSHIRE.

BEAUTIFULLY situated on an eminence commanding extensive views of a varied and interesting tract of country, Shirenewton, the residence of E. J. Lowe, Esq., is of more than ordinary interest to gardeners and lovers of a garden. Of course, one expects to see Ferns in abundance there, and he will not be disappointed, but a visitor to the grounds will soon have it manifested that other prominent features are in course of formation. Crossing the lawn in the direction of the garden, a fine specimen of *Abies Welbiana* attracts attention, and close beside it a handsome young specimen of *Thuja dolabrata variegata*, much more conical in form than usual. Good specimens of *Cupressus Lawsoniana* are to be seen, and Mr. Lowe calls attention to the fact that he never cuts off the duplicate leaders, but lets them grow on, and in this way the trees become much more handsome than when the leaders are reduced to one. Plants of *Veronica Hendersoni*, self-sown, grow freely under trees in the garden, thus showing the use to which the plant may be put. Ferns in all stages of growth, form immense groups under the spreading Beech and other deciduous trees, but they get only a cursory glance in passing, as they are merely planted there until they show sign of developing their full character, when the best forms are transferred to more favourable positions.

The garden is stocked, in all probability, with a larger and more varied collection of subjects than any other of its size in the kingdom. Mr. Lowe is not a Fern specialist only, for herbaceous perennial plants in endless variety are planted in a manner more suited to their well-doing than to afford effect, and these meet the eye on either side on entering the garden. Straight in front there stands a withered stem of *Ferula gigantea*, 9 feet high, showing what it must have been the previous season; and at its base there is growing a group of a fine variety of *Forget-me-not*. A little further on is a plant of *Pyrethrum balsamita* (Lucense plant), a portion of the original plant from the gardens of the Vatican, and, as we all know, a plant with a history always has a special interest; another such is a species of *Pæony* found by Mr. Lowe on the Steep Holmes. Large pyramidal graceful specimens of Japan Roses are conspicuous objects. Immediately beyond these plants are *Michaelmas Daisies* in many varieties, several of them seedlings raised by Mr. Lowe. I may here relate one of the anecdotes he is fond of telling when walking among his plants. When living in Nottinghamshire before he came to Shirenewton, he related, he used to go to a barber's shop in the county town, which from its proximity to the railway-station was much frequented. One morning, on entering the shop, the barber then busily engaged in operating on a gentleman whose back was towards the door, he enquired of Mr. Lowe, with the familiarity of his craft, as to what particular plant he was at that time devoting his energies. Mr. Lowe told him *Michaelmas Daisies*, adding that he had over 200 seedlings

"Then you cannot sing 'Lack-a-Daisy,'" came from the gentleman, who proved to be the well-known Canon Hole, now Dean of Rochester.

A distinct form of Elder was noted, which I learnt was found in a wood near to the mansion by Mr. Lowe's coachman when riding to hounds, and since named *Quintholm Queen*. A group of older Ferns than those previously remarked, and possessing distinctive features, were admitted by Mr. Lowe to be good forms, but I am told something better will be seen further on. *Cynoglossum Omphalodes* was studied with its small flowers of a beautiful shade of blue. Then a fine collection of *Spiraea* in many varieties was remarked, including *S. prunifolia*, *flor pleno*, which should be more commonly cultivated than it is.

On a wall which intersects the garden, a variety of climbing plants are grown, including a large one of *Abutilon vitifolium*, the only protection the plant had during the winter being a covering of mats. Here was a magnificent specimen of *Hydrogea scandens*, which, though planted only four years ago, already covers a large space of wall. A lean-to house on the north side of this wall gives access to the Ferns. Just outside the door is a sunken pit built with brick up to the ground-level, with a shading of *Willesden* scrim over the glass. Here are the *Film*-Ferns, some of them very fine specimens, and all in robust health. Being removed to a distance from artificial heat, and afforded a humid place in which to grow and live, the *Film*ies are remarkable for health and vigour. The Ferns which gained so many honours at the Fern Conference held at Chiswick in 1890 occupy a sheltered corner. The plants that then did such good service are in the best of health, but better forms of many of the varieties, and in surprisingly large quantities, are distributed all over the garden, interspersed with a fine collection of *Narcissus* and other bulbous plants.

In a span-roofed house the miniature Fern, *Asplenium Trichomanes*, and the equally humble *A. Ceterach* in greatly improved form, keep company with the more rare *Kelwayi diversum*, except that they were denied the luxury of a bell-glass, which the latter demands. A cold frame in this section contains probably one of the finest collections of *Polypodiums* extant, the result of many raids on the walls of not distant Raglan Castle, the Welsh hills, vales, and several foreign countries.

The glass structures are largely devoted to Ferns, intermixed with uncommon plants. *Camellia Titiana*, one of Mr. Lowe's seedlings, which has, if I remember rightly, been twice figured in the *Gardeners' Chronicle*.

I was reluctant to leave Shirenewton and its gardens, a place where gardeners have a kindly welcome always, and where much is to be seen out of the ordinary run of gardens. J. McDonald.

### MOULDING-UP POTATOS.

As this is the season for the performance of work of this description, it seems to be a very fitting time to invite discussion as to the real reasons which may exist for the doing of work of this nature, work every gardener would be willingly saved from if it can be shown that it is superfluous. I have always been in favour of the practice, and so far as was practicable, always moulded-up Potatos. There have, however, been occasions such as is presented this year, arising from baked or dried-up soil, when the proper and useful performance of the work has been impossible. But under ordinary conditions, such as weather and soil usually presents, when Potato plants are of sufficient height, it is the rule to mould-up the plants, a rule to which there seems to be very few exceptions. The grower of Potatos in fields in a large way first works the horse-hoe freely amidst the breadths; then, when the soil has become well pulverised, sends the moulding-plough down between the rows of plants and casts up on either side a ridge of soil. In gardens where Potatos are grown in small breadths relatively, it is the rule to deeply stir the soil between the rows with hoes, at once destroying

\* E.g., Cornuta Perfection and Ariel.

weeds and pulverising the surface of the ground; and then to draw ridges of soil to the plants with the same tools. It is rough-and-ready practice, perhaps it may be termed rule-of-thumb practice, but done chiefly because it is ordinary practice, and without, in many cases, much intelligent comprehension as to the cause for such work being performed. Last year, having to conduct numerous trials of Potatoes on diverse soils in Surrey, the work of cleaning and moulding being done locally, and beyond my immediate control, I found late in the summer that one trial breadth growing on sharp and rather poor sandy soil, the only manure applied being of a chemical nature, had not been earthed-up as all the rest had been, and when

compared with moulding-up, may be obtained. So far as ordinary reasons for moulding-up Potato plants are furnished, they seem to be, first, the need for fully covering the newly-forming tubers with soil, so as to prevent deterioration from greening, by exposure to the air and light; second, to support the stems erect when subject to sweeping winds; third, to enable the rows to be readily found when the tops have died away; and, finally, by heaping soil over the tubers, to prevent, according to the Jensenian theory, contact of the disease germs or spores with the tubers, and thus preventing disease. This latter result, assuming that earthing-up does produce the desired protection, in any case can

assumed that fungoid spores would have been washed readily through a thin coat of loose soil, where there had been no moulding-up, into contact with the newly-forming tubers. And yet my experience was, on the land as stated, absolutely no disease, and a fine crop of tubers; whilst on other light though not sandy soil, and where there had been given the customary earthing, the crop was shockingly diseased—indeed, I have seldom seen it in worse form. However, all experience, I think, goes to show that, where the disease is destructive, mere ordinary earthings furnish little or no protection. Of Potato trials at Chiswick, there is a large one in prospective this summer. I have often in the past been greatly disconcerted because the tubers have been much diseased. The soil is light, but that may, after all, not be the real cause of these attacks. [We think it is, the rain freely carrying the spores to the tubers. Ed.] I have, however, noticed in lifting the tubers that the upper ones (for the crop is usually large) have been very near the surface. I have suggested that deeper planting may prove a palliative or perhaps higher moulding. In any case, whether so or not, it would be interesting to see the effects of these methods if applied.

But there has recently been made known, chiefly through American investigations, another reason for moulding-up Potatoes not previously understood. It is found, apart from the fact that some varieties have a far higher percentage of starch in them than others, that with some varieties and plants, the deeper the tubers are in the soil the greater the relative proportion of starch. If that be so, then it furnishes good reason, not only for moulding, but for deep moulding. No doubt sun-heat has much to do with the development of large tubers, and it is natural to assume that the nearer the tubers to the surface, the greater amount of heat. Those deeper in the soil are cooler, and it may be assumed that with them growth is slower, consequently the formation of starch is all the greater relatively. No doubt were small and large tubers from the same roots tested for starch, it would be found that weight for weight the larger tubers would have less, and the smaller more. If that really be so, how strongly does it exhibit the absurdity of growing such large tubers as are frequently seen, which are but masses of sap, whilst much smaller ones contain a far larger proportion of real food. Any analysis of Potatoes should be applied to tubers of the same variety, cooked and uncooked: to large and small tubers, to those near the surface, and those more deeply buried, and to some varieties from three or four diverse soils. Even farther may be, tested effects in starch-production of diverse manures so that experiments or inquiries in that direction may become almost endless. A. D.

MR. H. L. DE VILMORIN.  
(Veitch Medallist. See p. 734.)

the tops had died away the surface was as level as when planted. I commenced the lifting of the tubers with much concern, fearing that there would be found much disease. So far from that being the case, the crop throughout was perfectly sound, and really the heaviest relatively that was anywhere lifted. Many of the samples were wonderfully fine, and the entire crop elicited great admiration from all who saw it lying as lifted. I was so much impressed with the apparent effect on the crop of the non-moulding that in connection with a similar trial elsewhere on somewhat similar soil, I have requested that in the case of several varieties, of which there are several rows of each planted, that some two or three of the rows of plants remain unearthed, so that a fairer test of the relative effects of non-moulding, as

only be obtained when the moulding is very deep, such, for instance, as is found where true protective earthing is adopted. But earthing-up of this nature can only be efficacious when heavy penetrating rains prevail. When the weather is dry, it is a precaution that is, so far as crop-production is concerned, positively harmful. Last year we had, as all remember, a remarkably dry time up till August. It was specially a time when non-moulding might be regarded as beneficial, seeing that moulding does expose to the hot rays of the sun roots that it would doubtless be better to leave protected by such coating of soil as the ordinary flat-hoeing furnishes. But very heavy washing rains did come in the autumn, and with them the propagation rapidly of the Potato disease. It was a time when it may have been

### NOTES FROM TRING PARK.

SOUVENIR DE LA MALMAISON CARNATIONS.—These are not the easiest of plants to manage, and those who grow them in more or less quantity are always anxious to learn how Malmaisons have fared in places where they are extensively grown, whereby to form an opinion whether it is a bad year for the plant, and estimate their own failures or successes accordingly. Mr. Hill, gardener to Lord Rothschild, grows enough of these varieties of Carnations to fill several houses, but they chiefly consist of the flesh-coloured variety, with a good proportion of the Tring Park Pink form of it. This season the plants have done very well, some profusely-flowered, grand examples being noticeable. Few kinds of florists' flowers require a greater amount of skill to bring them to perfection, and few reward the cultivator so richly as these varieties of Carnation.

#### RICHARDIA PENTLANDII.

When the newer yellow-spined Callas, as they were called, were first introduced, every one sought for tests whereby they might be distinguished from *R. hastata*, a tolerably common plant in gardens, and some alleged that they might be distinguished by the presence or absence of the purple colour at the base of the interior of the spathe, but that this is not so is

proved by a strong plant of *R. Pentlandi* flowering at Tring Park which bears two flowers from the same crown, the one having a dark purple eye, and the other wholly of a clear yellow colour inside and outside the spathe, and showing no trace of purple colour at the base. A large number of the beautiful yellow *R. Elliotiana* and *R. Pentlandi* have flowered at Tring Park, and when seen together, it appears that the chief difference between these two is that the former has foliage spotted with white, while the latter has unspotted leaves.

## CULTURAL MEMORANDA.

### BOUGAINVILLEAS.

How rarely are fine well-flowered specimens of these plants to be seen, although if proper treatment is given them they are not at all difficult to grow. A few years ago excellent specimens of *B. glabra* were shown each year by Mr. Cox, of Corhampton Gardens, Bishop's Waltham, at the Southampton summer shows, and it may be well to give his mode of treatment.

It is most essential in the first place to obtain the cuttings from suckers, as flowering shoots never make fine plants. The soil for specimens should consist of equal parts good fibry loam and peat in a rough state, with an addition of dry cow-manure, and a good addition of coarse sand and charcoal. Good drainage is most essential. The training of the plants may vary at the discretion of the cultivator; but if grown as standards, the cutting when rooted should be grown on, and all side-growths removed until the requisite height is obtained, when the point should be pinched out to form a head. As soon as they have finished flowering, and their growths are thoroughly matured, they should be gradually dried off, and during winter they may be stored in a cool greenhouse. In spring, the greater part of the old soil should be removed, and the plants repotted, using the compost recommended above, at the same time tying the shoots into place for the forming of good-shaped specimens. To encourage them into growth, they should be placed in strong heat (a vinery in forcing suits them best), and watered sparingly until well-rooted. They delight in full sunshine; a slight shading is only required when the plants are in flower to prevent the sun from discolouring the blooms. Cuttings of flowering shoots, if taken when the flower first appears, and struck in strong bottom-heat, make nice little plants for table or conservatory decoration.

*Bougainvillea spectabilis*, although rarely seen at its best, may, I am sure, be grown successfully under glass in England, the main point in its culture being as much sunshine as possible, and drought at the roots. Plant it in a bed or border, where the water may be given sparingly. Here, in the Riviera gardens, it may be seen covering sides of houses with blossom, and it has well gained the name of "Glory of the Riviera." True, the greater amount of sunshine we get is favourable to the ripening of the wood, but the five to six months' drought we get during the summer is equally so, for I have proved that, if watered during this period, the plant does not flower so freely. *Riviera*.

### THE SOWING OF WALLFLOWER-SEED.

Seeds of the Wallflower should be sown in the second week in June for flowering in the spring of the year following. This I find is the best time for sowing in the midland counties, but in southern counties a fortnight later is better. Some cultivators sow the seed in May, and by so doing get plants which are too tall for small beds by flowering time.

Seed should be purchased from a trustworthy source, in order to have the colours true to name, and the plants of uniform height; home-saved seed is almost sure to get crossed with undesirable varieties, which are far too plentiful about cottage gardens and elsewhere, and then only disappointment awaits the gardener. An important point is to prick out the plants into nursery-beds as soon as they have reached a height of 2 inches, crawling in the seed-bed leading to legginess

in after-life. Plenty of space must be afforded them, and weeds diligently destroyed. One foot between the rows and 9 inches between the plants will be found suitable distances to plant in the nursery-beds. Choose a showery day early in September to begin operations, partially lifting the plants with a steel fork, so as to break the main roots, but leaving a ball of roots and soil intact, which, while it checks growth for a time, ensures lots of fibrous roots by the time the plants are transferred to the beds in which they are to flower. This final planting should be done soon after the middle of the month of October.

There are many strains of Wallflower seed now offered by the trade, but the old Belvoir Castle Yellow and Veitch's Dwarf Dark Red are the kinds which are grown at Belvoir for spring flowering, which give full satisfaction. A few of the double-flowered German varieties are grown, but these are chiefly for cutting; they have a rather formal appearance when growing, but if tastefully arranged in large vases, they look very pretty; being of a stronger habit of growth than the single varieties they are not quite so hardy, and should be wintered in a dry and sheltered position.

The old dark, double-flowered Wallflower, once common in cottage gardens all over the country, seems to be lost to cultivation, for though I have made many enquiries, I have failed to obtain it. The double-flowered yellow variety is plentiful still, also the small dwarf-growing yellow variety which recently gained an Award of Merit from the Royal Horticultural Society's Floral Committee under the name of Harpur Crewe. Can anyone give the origin of this variety? It came to Belvoir many years ago from Miss Hope, of Wardie Lodge. All of these old double kinds have to be propagated by cuttings (slips), which should be put in a handlight under a north wall as soon as they can be obtained. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

## THE UTILITY OF VINE GRAFTING.

THE question of grafting delicate Vines on other and stronger-growing varieties was discussed many years ago, when a number of new Grapes of excellent quality were raised, and in many cases discarded for the reason that they were poor growers or bad setters. There was not so much headway made as was anticipated, and in many cases strong-growing Vines were proved to be unsuitable as stocks for delicate-rooting varieties. My notes of observation date back over a period of many years. Some of our enterprising nurserymen used to prepare Vines by grafting them on stocks in pots; Muscat Hamburg was one that was frequently so treated, but the advantage from grafting appeared to be but of short duration.

Of late years I have seen much good attempted by grafting among our northern Grape-growers, but there is nothing of special note to record. Golden Hamburg was among the first which I made a special effort to improve, and I succeeded better with that excellent Grape than with any other. Grafted on Black Hamburg it produced large, finely-flavoured berries, which kept as late as the end of the year. Muscat Hamburg grafted on Black Hamburg, was a success for some years, though it gradually became very similar to those on their own roots, yet they always set well, and kept fairly well. It would be most pleasing to again see that Prince of Black Grapes exhibited as it used to be seen at the Edinburgh shows, when exhibited by the late Mr. Fowler, Castle Kennedy. The bunches were fine, and 6 lb. in weight, with berries nearly 1½ inches in diameter. Some years later the late Mr. Johnstone, then at Glamis Castle, grew them with remarkable success. In each of these cases the Vines were grown upon their own roots. I have a Vine of that variety now carrying ripe Grapes inarched on Foster's Seedling. It does fairly well, but the flavour is decidedly inferior to the same variety produced on its own roots; inarched on Gros Guillaume, the berries were somewhat smaller and more round; while on Alnwick Seedling they are much the same,

but bunches are more compact, and not better than those on their own roots. We have Duke of Buccleuch inarched on Black Hamburg, but I think it was more fruitful on its own roots. I should always prefer to grow it where the roots are entirely under control in a space confined by bricks and mortar. Gros Colmar grafted on Gros Guillaume is smaller in berry, and ripens earlier than the same variety grown on its own roots. White Tokay make a good stock for Gros Colmar. The greatest change in size and appearance on any Grape I have seen was Duchess of Buccleuch inarched on West's St. Peters. The bunches were shorter and wider, and the berries became nearly as large again as those from a Vine on its own roots. Madresfield Court has been often grafted on another stock, but in no case have we seen it larger in berry, finer coloured, and more free from cracking, than from Vines on their own roots. I have always seen it quite free from cracking when ripened in a house where abundance of air has been given, and the atmosphere kept quite dry. That is the treatment that Mr. Kirk at Alloa has given to those large and excellent bunches he has exhibited so often. Mrs. Pince has justly received more attention in the north, but I fail to see where it is superior to first-rate Lady Downes. We have still some of the latter fresh, and of fine flavour. *M. Temple, Carron, N.B.*

## CLIMATE AND TREE GROWTH.

Most people are aware that the latitude and longitude of a particular district afford but a very poor indication of the climate it enjoys. Proximity to the sea, a range of hills, or the difference in the elevation of the ground, make much difference in the climate and rainfall of two spots but a very few miles apart. The effect of these climatic variations are very evident in the condition and growth of vegetation in various districts. The budding of plants in spring, flowering in summer, and ripening in autumn, afford sufficient proof that plants are more sensitive to outer influences than animals, and that these influences exert what we may term a cumulative effect upon tree growth. Climate, to a limited degree, it is true, has rather a relative than an absolute effect upon vegetation in any one season. If temperature alone were to decide the active or dormant condition of our trees, we should have buds bursting in mid-winter, or shoots continuing their growth into December in some seasons. But there is in plants a certain periodicity of growth which is affected but not entirely ruled by climatic conditions, and which acts as a deterrent upon the curious inconsistencies of the weather. Continuous and uninterrupted growth for any length of time is almost an impossibility, and rest is as essential to plant as to animal life. In all perennials we find alternating periods of rest and activity comparatively constant and well defined, and whatever the weather may be, these periods vary by a few days only. It is during the growing stage, however, that climate chiefly asserts its influence, and by affording or withholding the necessary degrees of heat and moisture, promotes or retards growth. The effect of severe winter frost upon arboreal vegetation is largely determined by the weather of the preceding autumn. Should the latter be warm and sunny, the annual growth is thoroughly matured, and able to bear a greater degree of cold than badly-ripened wood. This condition of maturity is probably further reaching in its effect than would appear at first sight. The formation of buds in autumn is one of the most important functions of the whole season's growth, and upon this the growth of the following season greatly depends. When buds are imperfectly developed for successive autumns, the vitality of the tree is undoubtedly weakened, and its timber is more prone to decay. Injuries to such a tree by late frosts, &c., are less readily repaired than in the case of one with a good supply of reserve material stored up in its wood, the result of proper ripening.

The humidity of the atmosphere is also of importance in connection with growth. The effects of late frosts, and cold, drying winds, are greatly intensified or decreased, as the case may be, in situations

where the air-moisture is a few degrees more or less than the average. Late frosts may be highly injurious in one situation, and comparatively harmless in another, owing to the slope or exposure of the ground, its elevation, or a few days' difference in the state of forwardness of the trees. Species easily injured by frost when young, such as the Beech or Silver Fir, are rarely damaged in late life, for the reason that, in the late stages, the growing points are further removed from the ground and region of stagnant air, and also are late in commencing growth. Trees which naturally make a rapid and uninterrupted growth, as is the case with many of our introduced Conifers, are most likely to receive serious injury from late frosts. Most of our indigenous trees, apart from their constitutional hardness, possess special means of protection. The Pines, for

way in autumn or spring, and are comparatively inactive during the growing season of their hosts. In a climate where the winters are long and severe, the development of such parasites is necessarily restricted to the short autumn and spring, and their growth, compared with that of their host, is limited. Where, on the other hand, the average winter temperature is sufficiently high for the growth of the mycelium and the development of spores, the power such fungi are able to exert over their host is enormously increased, and the balance of Nature upset. This power is further increased when the health and growth of the host is affected in any way by adverse conditions. Should the latter be a species which is unusually stimulated by temperature and rainfall, so that in warm autumns its growth is not checked until the advent of frosty nights, it is evident that its wood

on in the vegetable kingdom. A very slight advantage or disadvantage may, in the course of centuries, determine whether a species is to predominate or become exterminated, and any cause which tends to hinder the development of a plant, is an advantage to those of its competitors which may not be affected by that cause. Spells of sunshine and cloud, heat and moisture, alternating with one another, favour now one and now another species, but the general effect depends upon a combination of circumstances which most nearly approach the optimum demanded by the most vigorous species present. What these conditions are we can only learn from experience, and then, as often as not, probably we arrive at an erroneous explanation of many phenomena observed in the development of a plant in any given locality. *A. C. Forbes.*

DISPLACEMENT AND REPLACEMENT OF THE NATIVE VEGETATION OF NEW ZEALAND.

In an Address delivered before the Philosophical Society of Wellington, New Zealand, and published in the *Transactions of the New Zealand Institute*, vol. xxviii., Mr. Thomas Kirk has brought together a large number of most interesting facts relating to the changes the native fauna and flora have undergone, consequent on the advent of civilised man. It is difficult to realise what changes have taken place in the vegetation of our own country since the dawn of civilisation, but they must have been very great, as a few isolated facts suggest. To give an illustration: Sussex, I believe, has a larger relative area under wood than any other English county, and certain parts appear to be practically undisturbed remnants of the primeval forest that covered the weald. In these reserves there linger, or lingered, until recent collectors extirpated them, such plants as *Hymenophyllum tunbridgense*, *Carex montana*, *Habeuaria albidia*, *Empetrum nigrum*, and *Sibthorpia europea*, which were never known to exist in the adjoining counties, though we may assume that they did formerly exist, and have been displaced, as they now occur only in distant western or northern counties. Known instances of introduced plants having spread nearly all over the kingdom are now numerous. *Veronica Buxbaumii* is a familiar example of a prolific colonist, and there is no doubt that most of the corn-field and domestic weeds, as well as many herbs formerly cultivated for household purposes, were originally introduced. Further, there is no doubt, that the indigenous flora was poor in species. But we have not the complete history of the changes wrought here directly or indirectly by man. In New Zealand it is otherwise. The native flora was investigated before it had been much disturbed by the immigrant people from the North, who have now spread all over the islands. And among the early, as well as the more recent settlers, were observant men who have from time to time recorded the rapid changes that have taken place around them. Mr. Kirk himself has been most active in this direction during the last thirty years or thereabouts—the period in which the greatest changes have taken place. Although man was the primary, and indirectly the sole cause, of these changes, he has been the means of starting many operating agents. Apart from subsequent results, the felling of the forests for timber and the firing of the bush for cultivation entirely altered the aspect of the country; but the introduction of foreign plants, animals, insects, and birds, have effected changes that could not have been foreseen, and changes incredible, were they not authenticated by competent observers. It is computed that 500 species of exotic plants have become more or less completely naturalised in New Zealand, and they pervade the country from the sea-shore to the highest limits the shepherds have reached in the mountains. Many have become so abundant in certain districts as to be much more prominent than the native plants, and many have reached and established themselves in localities where, in the absence of evidence to the contrary, they would certainly have been regarded

PROFESSOR CHARLES S. SARGENT.  
(Veitch Medallist. See p. 734.)

instance, merely push out the main axis of the shoot under a protecting sheath of bud scales for the first week or two of growth, and not until late in spring do their needles become exposed to danger. The Ash is particularly sensitive to both late and early frost, but as it begins growth late in spring, usually escapes injury. In the case of Beech, Oak, and Elm we find two distinct growths are made in most seasons, so that should the first be injured, the second (midsummer shoots) are able to compensate the injury. By such devices do our trees usually manage to evade or make good the dangers and casualties of a fickle spring, and by generally finishing their growth in good time, ensure a well-ripened condition of wood and buds.

It is not merely in connection with the growth of trees themselves, but in the development of their vegetable parasites also, climate plays an important part. Many of the parasitic fungi make most head-

cannot be properly ripened, and is consequently easily injured by frost and other causes which have little effect upon well-ripened wood. Should spores of a parasitic fungus gain an entrance into any of these wounds, the condition of the wood is highly favourable to their germination, and the growth of the mycelium, the latter penetrating the tissues without meeting with great opposition. Add to this condition of the wood, a mild and wet winter, and there is a combination of circumstances all in favour of the parasitic development, which may make it a deadly scourge in place of a comparatively harmless affection.

The effect of climate upon any species of tree is pretty accurately indicated by its range of distribution. If this be extensive, the species is usually hardy and suited to different conditions and surroundings; where limited, the reverse is usually the case. The reason of this is obvious, if we consider for a moment the struggle for existence which is continually going

as indigenous. In deed, what has taken place in New Zealand throws a new light on the geographical distribution of plants.

The displacement of such vigorous native plants as *Phormium tenax*, *Aciphylla* of various species, *Cyperus ustulatus*, *Pteris esculenta*, and *Leptospermum scoparium*, by introduced grasses and Clovers seem well nigh impossible; but we are assured that it is so, and the process is described. Anyone who knows these plants would have thought that they, having possession of the soil, no interlopers would have a chance in the struggle for existence, much less the relatively delicate grasses and Clovers. Dense masses of the formidable "Spaniard" and "Spear-grass" (*Aciphylla* spp.), absolutely impenetrable to stock of any kind, are gradually destroyed by this apparently impotent agency. On the other hand, some of the most valuable native grasses, *Microlæna stipoides* and *Danthonia pilosa*, for example, are able to compete and amalgamate with the invaders, to the great advantage of the grazier. Among woody plants capable of replacing and displacing the native vegetation, Mr. Kirk names *Epacris purpurascens*, *Eucalyptus* (various species), *Albizia lophantha*, *Acacia decurrens*, *Hakea acicularis*, *Robinia pseudacacia*, *Ulex europæus*, *Cytisus scoparius*, and *Rosa rubiginosa*, the three last being particularly troublesome.

With regard to the actual extinction of indigenous species, Mr. Kirk is hopeful, and believes that no large number will disappear unless under special conditions not yet experienced. Certain exceedingly rare plants may be exterminated by accident, or an unusually hungry rabbit or sheep. For instance, the beautiful *Clianthus puniceus* is now restricted to one or two islets where sheep are unknown, to which circumstance it owes its existence.

It is impossible to read Mr. Kirk's article without being impressed with its value and interest, and to speculate on what may have happened in countries of early civilisation. *W. Botting Hemsley.*

## THE WEEK'S WORK.

### THE KITCHEN GARDEN.

By C. HERRIS, *Gardener, Draymans, Maidstone.*

**BRUSSELS SPROUTS.**—The plants for the main crop, if they be large enough, may now be planted out. Choose an open situation where the plants will grow dwarf and strong. The land should be in good condition, and if a space of 2 feet 6 inches to 3 feet can be allowed between the plants, it will not be too much. Draw drills about 4 inches deep in which to put the plants, and it will facilitate watering if this be necessary, and the ground can be levelled during the process of hoeing.

**CARDOONS.**—If these have been raised in pots and hardened off as advised, they will now be ready for planting out in the trenches that have been prepared for them. Sufficient room should be given each plant for proper development, such as 2 feet apart in the rows, and if more than one row be required, place them from 3 to 4 feet asunder from each other.

**SALADS.**—Make sowings of Lettuce and Radishes once in every ten days. Mustard and Cress should be sown oftener, according to requirements. A small sowing of the curled type of Endive may be made, although for salading this is usually in little request while plenty of good Lettuces are obtainable.

**LATE PEAS.**—Make a last sowing of late Peas. If they are to follow some other crop on ground that has not been trenched and prepared for Peas, trenches should be thrown out and a good dressing of rotten manure dug in, as is done for Celery. If the late Peas usually suffer from the attack of small birds, it will be advisable that dwarf rather than tall varieties be now sown, that the rows may be the more conveniently covered with garden netting when pecking commences. Autocrat and Late Queen are suitable varieties, and they are less subject to mildew than some others. If the soil is dry, well water the drills a short time before sowing, and after the seeds are covered in, lightly tread the soil over them to prevent the evaporation of moisture, germination will then sooner take place.

**GENERAL WORK.**—Where Marrows are growing freely the ban-lights or other protection may now be

removed, and the longest shoots should be carefully pegged down to prevent their blowing about; more seeds may be sown to provide a late supply. The same treatment may be afforded ridge Cucumbers. Late Potatoes should be moulded up as soon as high enough, for if left until the tops fall over, the work cannot be properly done. A bed of the Silver-skinned Onion may be sown for pickling purposes. Sow the seeds broadcast, and rather thickly; they will not require thinning. A further sowing of a variety of Short-Horn Carrot may be made for the supply of young small roots later in the season.

### PLANTS UNDER GLASS.

By JNO. MCINTYRE, *Gardener, Woodside, Darlington.*

**ERICAS.**—Specimen Ericas require very careful management during the warm months, which is the most critical season. They succeed best in a cool temperature, and much difficulty is experienced if a house is not set apart for their cultivation, in which the plants may be kept sufficiently cool and ventilated. Those specimens which are to flower this summer should be removed to the north side of a building, hedge, or wall, a temporary covering of glass sashes being placed over the plants. The summer sun should not be permitted to shine on the pots wherever accommodated, as it heats them to such an extent, that frequently the fine roots perish in consequence. The finest specimens of Ericas I have seen were managed during the summer season in the manner indicated; and it is one very well suited to the needs of the plants. If a house can be devoted entirely to Heaths, the management is much less difficult, and there need then be no makeshifts. Cultivators differ in regard to the potting season; my method, however, is to shift a flowering plant immediately after the flowering is past, and before fresh growth begins. It is at this period that disturbance at the roots causes the least amount of injury. The greatest care is necessary in re-potting aged specimens; only the most experienced gardeners should be allowed to undertake the operation. The pottio-g-soil should consist of the best fibrous hard peat, all peat of a spongy nature being avoided. The dark-coloured peat with a large proportion of sand in it is the best, and for large plants a considerable quantity of coarse silver-sand should be mixed with it after it has been pulled to pieces. The soil should be placed in a small quantity at a time round the old ball, after the outer roots are carefully loosened with a sharp-pointed stick, and rammed firmly with a tapered potting-stick, thereby making it quite firm to the very bottom of the ball. Good drainage and clean pots if new, soaking them in water before using them are indispensable; and to make it impossible for the drainage to get out of order, humps of peat should closely cover the mass of crocks. The soil of the ball and the new peat used in the re-potting should be in a moist condition. If the regulating and training and staking the shoots were operations that received attention during the winter, nothing will be required at the present season beyond placing the flower-trusses so that they may be seen to advantage.

**RHODANTHE MANGLESII.**—A good sowing of seeds of *Rhodanthe Manglesii* and *R. m. alba* should be made, for furnishing plants for the greenhouse in the late summer months. Sow the seeds thickly in a light compost in 5-inch pots, thinning the seedlings to twelve plants in a pot. Place the pots in a cool pit, and keep them near the glass to prevent spindling.

**PELARGONIUMS.**—Zonals for winter flowering should be turned out-of-doors on to a bed of coal-ashes, but afford them the final re-potting. For small young plants, pots of 6 inches diameter are large enough, as larger pots do not give more or better flowers, and the soil is difficult to keep free from conferva. Moreover, artificial or other manure can always be given when plants become pot-bound and the soil exhausted. Pinch the points of all the shoots, to give bushiness. The potting-soil should not be of a rich nature, and may consist of two thirds loam and one third leaf-mould, with sand in quantity, to prevent souring.

**ALOCASIAS.**—There are many handsome species and varieties, but few exceed the beauty of *Alocasia Sanderiana*. Next to that one I would place *A. Lowii*, then *A. metallica*, of which a well-grown specimen is difficult to beat. *Alocasias* thrive in a compost of fibrous peat, sphagnum-moss, and coarsely-broken charcoal, anything of a close nature being injurious to them. Throughout their season of growth, water at roots should be copiously afforded, and they should be shaded from bright sunshine. Some gardeners

dry off these plants in the winter; but for the generality of *Alocasias* this is detrimental, the roots perishing and the plants decreasing in size year by year. I find that water in sufficient quantity to keep the roots plump and healthy should be afforded during the resting period. Plants which lose their roots spend a great part of the growing season in replacing them, with the result that the cornus suffer. *A. macrorrhiza* is one species which may be safely dried off, the corn being of a very succulent nature; but all other species should have water only partially withheld.

### THE HARDY FRUIT GARDEN.

By G. WOODGATE, *Gardener, Rolleston Hall, Burton-on-Trent.*

**APRICOTS.**—The final thinning of these fruits may now be made with safety. The exact number that should be left will depend on the variety and healthfulness or otherwise of the trees. A vigorous tree may perfect more fruits without showing weakness than a weaker one, and in all cases it is better to err by leaving fewer than more than the tree can properly perfect, as small fruits are but little appreciated.

**PEACHES, NECTARINES AND CHERRIES.**—Continue to make secure all young growths upon Peach, Nectarine and Morello Cherry trees, and thin the fruits upon the two former as required. Carefully remove and burn all blistered leaves resultant from the attack of the fungus *Exoascus deformans*. Trees which show unusual susceptibility to such attacks should be marked, that the trees may be lifted and root-pruned in the autumn, it being very probable that the roots have penetrated into cold and ungenial soil. Healthy trees with their roots close to the surface are seldom attacked with blister. Secure adequate protection from birds for the Strawberry quarters, and if some extra fine fruits are required for exhibition, some of the best trusses should be supported by forked twigs of sufficient length to keep the fruits well above the soil. Nets must be placed over Cherry trees as soon as the fruits begin to change colour, or the blackbirds and thrushes will soon succeed in clearing the trees. When the stoning process is over, and the fruits commence their final swelling, it is extremely important that the roots be not allowed to lack moisture. Thorough soakings of manure-water will greatly conduce to the swelling-up of the fruits.

**GRAFTS.**—Many of the young grafts are growing freely, and now require to have the old fastenings removed, that the natural swelling of the stocks may not suffer any hindrance. It is advisable, however, to retie the grafts (not too tightly) for a while longer, and a stick should be tied to the stock for the purpose of supporting the scions, to prevent dislocation by the wind.

**MISCELLANEOUS.**—The young shoots of red and white Currants are badly infested with aphids, but if the points be pinched-off and burnt, it will, in most cases, clear the trees. Gooseberry-trees, if likewise attacked, should be similarly treated. Where Pear or Apple-trees have set heavy crops of fruit, some of the smaller ones should be removed, and at the same time take away and burn all that have been attacked by caterpillars.

### THE ORCHID HOUSES.

By W. IL WAITE, *Orchid Grower, Burford, Dorset.*

**SPECIES OF CHYSIS.**—Plants of *Chysis bracteosa*, *C. Sedeni*, *C. Limnighei*, *C. aurea*, and *C. Chelsoni*, during the summer months, should be suspended in a warm, shady part of the Cattleya-house, for if kept in the East Indian-house, the younger leaves assume an unhealthy hue, and insects of various kinds will usually upset them. For a period of a week or ten days after removal the plants should be sparingly afforded water, or the slight check the change of abode causes may cause the loss of the young growths from damp, but copious applications will be necessary afterwards. As summer wanes the plants should be replaced in the warmest division to complete and mature their growth and pseudo-bulbs.

**ODONTOGLOSSUM CITROSUM.**—This fine species should, now that its flowering season is past generally, be re-potted or top-dressed as the case may suggest. Owing to the flower-spikes being pendulous, baskets or shallow pans which can be suspended from the roof are better than flower-pots, and as this species does not make many roots, the baskets or pans should be relatively of the smallest size, and ample drainage should be afforded, over which

a layer of sphagnum-moss should be placed so that the lowest roots may be kept moist during the growing season. Fibrous peat and fresh living sphagnum, with a handful of broken crocks mixed with these to keep it porous, make an excellent compost for this plant. Pot firmly, as by so doing the pseudo-bulbs retain their plumpness longer when the season of rest arrives, than if the materials are loose. *O. citrosum* is one of the few species of *Odontoglossum* which requires a warm temperature. It should be suspended close to the roof of the Cattleya-house, where it gets plenty of fresh air at all times. For a fortnight after re-potting keep the compost merely moist, but after that time has elapsed water copiously, and keep it up till the new growths are matured. Some cultivators syringe them overhead at closing-time, but this is better omitted, unless the plants are so placed as to be exposed to sufficient sunlight to enable them to get dry quickly. Careful cultivation is necessary, and when *O. citrosum* is really well grown, few plants are more beautiful, or have a more distinct appearance.

**MILTONIA VEXILLARIA.**—In many collections these plants will be going out of flower, and nothing should be done that will induce growth, because the longer the period of rest this species enjoys, the stronger will be the new breaks when the season of activity recommences. For the next six or eight weeks the plants should be afforded a light position in the cool-house, exposed to as much fresh air as the rest of the occupants. Very little water will be necessary to keep the pseudo-bulbs and foliage plump and healthy till new growth appears. The distinct and late-flowering varieties of *M. vexillaria*, as *M. v. rubella*, *M. v. Leopoldi*, and *M. v. sup rba*, may also be removed to the cool-house. The hybrid, *Miltonia Bleuana*, should always be kept in the intermediate-house. It is a species that begins to make growth at this season, and close observation must be kept on the young growths for a species of small yellow thrips, which quickly infest them, causing the foliage to take on an unsightly appearance throughout the growing season.

**EPIDENDRUM VITELLINUM.**—This bright-flowered plant, now passing out of bloom generally, should be re-potted if this be required. It does not require much root-space, but much moisture is necessary till growth is completed. It will generally be found to do well in a light, airy position in the cool-house. For providing flowers which last for several weeks when cut, and for the general effect they produce when arranged with *Odontoglossums* of the crispum section, this species is amongst the most useful that can be grown.

**ODONTOGLOSSUM GRANDE.** *O. Schlieperianum*, *O. Inseayi*, and its variety, *leopardinum*, will now be starting to grow, and the plants should be re-potted into a very porous compost, for although they delight in plenty of water when growing, it should pass away quickly, otherwise the fleshy roots will be very liable to decay. As the breaks push up, and the leaves expand, see that no water lodges in the centre of the growths, or they will probably damp-off.

## THE FLOWER GARDEN.

By HEDLEY WARREN, *Gardener, Aston Clinton, Tring.*

**WORK IN GENERAL.**—Now that true summer weather has set in over most parts of the country, the planting-out of the tenderest bedding plants may be proceeded with, including Dahlias of all kinds, and the various species of plants used in sub-tropical gardening. In parts where the rainfall has been light, due attention must be given to affording water to plants of all kinds in beds; and in some instances an occasional stirring of the surface of the beds with a small short-handled hoe will be of benefit to them in giving a more ready entrance to water, and in aerating the soil, besides making the beds more trim-looking till such time that the plants cover the ground. All plants needing support should be securely staked and tied as soon as they are planted. The grouping on the lawns and other places of plants in tubs and pots may now be proceeded with. These include the hardier species of Palms, Bamboos, Plumbagos, Lemons and Orange-trees, Myrtles, Tree Ferns, Fuchsias, *Cordylina australis*, Pomegranates, *Yuccas* in variety, Ivy-leaved *Pelargoniums*, &c. By plunging the pots (tubs must not be plunged) up to their rims in the turf, or in beds of fine gravel, taking care that no worms can enter the pots, a great saving in watering will be ensured, and the unsightly appearance of the pots avoided, besides more stability given to the plants against wind. Plants of 6 feet or more in height should be secured to stout stakes,

which should be kept out of sight as much as possible. The mowing of lawns and verges, and clipping the edges of the turf as occasion requires, will require constant attention, as will the weeding of garden walks and carriage-drives.

**GLADIOLUS.**—The earliest-planted being now advanced in growth will require water at the root unless rain has been very abundant, the soil being stirred with the Dutch-hoe previously to applying water. Afterwards, a mulch of short dung in a rotten condition should be afforded to beds or patches of the plants.

**SEEDLING CARNATIONS** may now be planted in beds or lines of well-dressed, deeply-dug land, at about 18 inches apart. If these are raised from early sowings, there is still time for many of them to flower the present year, and those which do not may be lifted and potted in October, or allowed to remain for flowering next year. In very damp land it is, however, best not to risk the plants out-of-doors during the winter, but to pot up all.

**ROSA RUGOSA.**—This species is in excellent form, with foliage fresher and brighter than that of any other Rose; and although most other Roses are greatly infested this year by various kinds of insects, *R. rugosa* has so far escaped their attentions, and the plants are flowering with freedom. Our plants of it are not hard-pruned, many of the branches being left at full length, thus giving it an appearance more in harmony with its surroundings in the shrubbery and wild garden.

**AUSTRIAN BRIARS** are also blooming freely, and the ephemeral nature of their flowers is compensated with their extraordinary abundance in such years as the present. The colours of the flowers are so strange and yet so charming, that no garden of any extent should be without them.

**BORDERS OF HERBACEOUS PERENNIALS.**—In old borders many of the plants are flowering freely, and the decussata *Phloxes*, tall *Delphiniums*, perennial *Lupins*, and plants generally which make great numbers of flower-stems should be examined forthwith, and have all of the weaker stems cut away at the base, thus throwing energies of the plants into the stems that are left, with the result that the flowers and flower-heads are much finer than would be otherwise the case. It is, however, work that needs careful doing, to avoid giving an unnatural appearance to the plants. Many herbaceous perennials require stakes for tidiness' sake, but they must not be bunched up, but each plant should be allowed to assume its proper character. Attend to the watering of such plants as appear to be suffering from lack of moisture at the root.

**GARDEN PINKS**, although now in full bloom, have not suffered from the drought [they like it. Ed.], but look very healthy. Propagation of Pinks from pipings may take place as soon as the general flowering period is over and the grass of sufficient length. Pinks root well in sandy soil in frames or hand lights, keeping them close and shaded till renewed growth is seen; then air gradually, and in a fortnight give full exposure.

## FRUITS UNDER GLASS.

By W. POPE, *Gardener, Highclere Castle, Newbury.*

**THE EARLIEST PEACHES AND NECTARINES.**—As soon as a tree is cleared of its crop of fruit, much of the wood which has borne it should be removed, which will allow the sun and air to reach next year's bearing-wood. Should red-spider or plant-lice infest the trees, employ the garden-engine or a powerful syringe, and some good kind of insecticide, or use soft-soap at the rate of 2 oz. to the gallon of soft-water, which will be found a very efficient remedy if it be applied warm and rather forcibly, so that the under-sides of the leaves be well wetted. If there are no insects on the trees, washing with soft clean water only will be necessary to remove all dust and dirt from the stage, daily syringings being afforded to keep it clean. The borders should be kept in a moist condition, and, if necessary, fresh mulchings of short manure may be applied to them. Admit plenty of air at all times, and endeavour to preserve the foliage in health as long as possible, the starving of the plants in any form being avoided, as it causes premature ripening of the leaves.

**SECOND EARLY AND LATER HOUSES.**—Plenty of air should be admitted by day to ripen fruit, and a certain amount of circulation during the night by means of the ventilators at the top and bottom of the houses. Keep the borders thoroughly moist,

and afford the fruit all the light possible, tying aside leaves or shoots which shade it. The fruits should, in most cases, be gathered a few days before required for use, going over the trees each day and taking such as are found to part readily from the stalk, storing them in a dry, cool room. In dull weather the fires should be made use of to ensure a circulation of air in the houses. In the late houses disbudding and thinning the fruit will now have been finished, and where the new shoots are crowded, remove a few to afford more space for those that remain. In favourable weather, ventilate the house freely, and close it in good time, syringing the trees twice a day. Mildew, if it should appear, must be checked without any delay, or the crop of fruit will be spoiled, and the trees much injured. The best remedy for mildew on the Peach is to spray with  $\frac{1}{2}$  oz. of sulphide of potassium mixed in 1 gal. of water applied in the evening, the dressing being repeated if it be deemed necessary. If aphid infest the points of the shoots, pick off and burn the curled leaves, and then fumigate the house for a few nights; and should the daily syringings not suffice to destroy red-spider, use soap-suds instead of clean water for a day or two, or till the foliage is freed from the pest.

## THE APIARY.

By EXPERT.

THE cool weather experienced in this part (Berks), has in a great measure prevented the bees from swarming, and also stopped them from doing much work, but in the more southern parts of England the sections will be found to be half or three-parts filled, and in some cases quite full; it is then better to raise the crate and place another underneath it, filled with starters or full sheets of foundation, the latter way being the best, as this will give the bees a good chance of filling two lots of sections at the least, as they will generally travel up through an empty one to finish off, filling and sealing the sections which have been raised up, whereas if the empty crate is raised on the top, the bees do not in all cases take to it so readily when the sections are fit to come off. The best thing is to use a "Porter Bee Escape," which can be bought for 1s., and fixed in a board the size of the crate, and placed underneath it, the bees who do not care to be separated for long from the chamber below will soon commence to pass through the escape, which also prevents them from returning. If this is placed on in the evening, the sections in the morning will be found free from bees, and ready to store away in a dry place free from dust and insects. For extracting honey, the following method may be adopted with success:—Take two strong stocks, and from one of them remove all the combs, brushing the bees back gently into the hive; place the combs in an empty hive, and fill the hive from which the brood-combs were taken with empty combs, if you have any by you, if not with comb foundation. The hive with the brood-combs is now placed on the top of the other stock, which forms a second storey, by which means a double set of combs are given; the hive full of comb is soon filled with bees, and this large number of bees will soon fill the frames with honey, which can be emptied by the extractor and again returned—by these means swarming is in a great measure prevented. Where it is wished to start fresh colonies by swarms, care should be taken that they are well fed for a few days in wet weather, as they then have no chance to collect honey; care should also be taken to keep the hive level. Keep a careful look out for toads, as they are most destructive to bees.

## THE SEASON IN THE NORTH OF SCOTLAND

—The season hitherto, writes a Northern correspondent, has been exceptionally fine—perhaps the finest within living memory. Fruit promises an abundant crop, and it is more abundant on trees whose blossoms expand late. Gooseberries, in some localities thin, are generally very abundant; and the same report has to be given of Strawberries. Vegetables were, perhaps, never so far advanced. Potatoes are already of a good fair size, even those planted in the open border without starting. Sharpe's Victor, an Ashleaf, is conspicuous as one of our best earlies. It will soon be ready for table use—indeed, in some districts it is now being used. In the end of April and during the whole of May, autumn-planted Cabbages have been cut; while of Broccoli there was hardly a head but reached maturity. Young Carrots and Onions are already being used. As a whole, the garden may be said to be nearly three weeks earlier than usual. Grateful rains have fallen during the past few days.

## EDITORIAL NOTICES.

## ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

## APPOINTMENTS FOR THE ENSUING WEEK.

SUNDAY,	JUNE 14—	Brussels Orchidéenne Meet.
WEDNESDAY,	JUNE 17—	York Floral and Hort. Fête Roy. Hort. Soc. deputation. (Three days.)
THURSDAY,	JUNE 18—	Linnean Society. Colchester Rose and Hort. Show. Royal Gardeners' Orphan Fund (Annual Dinner).
FRIDAY,	JUNE 19—	Roy. Bot. Soc. Lecture.

## SALES.

THURSDAY	JUNE 18—	Clearance Sale of Greenhouse Plants and Garden Utensils, at Hollywood, Putney Heath, by Protheroe & Morris.
FRIDAY,	JUNE 19—	Imported and Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK—61° F.

The Royal Horticultural Society. The vitality of the Royal Horticultural Society is really astonishing. Who that remembers the evil days it passed through could have anticipated the measure of success it has attained since it made horticulture its first consideration, and abandoned those ruinous attempts to conciliate the fashion and frivolity of the town? To come to this present week, who could have anticipated, so soon after the Temple show, that the next ordinary meeting would be so extensive and so brilliant? The Drill Hall, which was adopted as a temporary meeting-place in default of any other, is now seen to be all too small in the summer season. The fortnightly meetings have developed into large shows. It may be ungracious to say so, in view of the magnificent exhibition of Tuesday last, but we fancy most plant-lovers would prefer the old fortnightly meetings, when it was possible to see and examine carefully the relatively small number of new and interesting plants that were brought together for the consideration of the experts. As things are at present, the exhibits are so numerous that anything like critical inspection is out of the question, especially when the number of committee and other meetings which are held on the same day is considered. To take one instance which attracted our attention: never we suppose was so extensive a collection of the species of *Brodiaea* brought together as was done by MESSRS. WALLACE of Colchester on Tuesday last. How valuable this was for botanical purposes, how interesting from the point of view of decorative horticulture, but, as careful examination was out of the question, the opportunity was necessarily

lost. The same may be said of some of the Orchids, the Roses, the Alpine plants, the Streptocarpus, and the Cinerarias shown by Mr. LYNCH. But, after all, the fine show of hardy shrubs, the specimens of Streptocarpus, the noble plant of *Carpenteria* in full bloom, the brilliant Roses, Peonies, and Larkspurs—but are not all these duly chronicled in another column?

Among the special proceedings of the day we may note the presentation by the President of the Society of the Medals awarded by the trustees of the VEITCH Memorial Fund to the distinguished recipients selected for the honour. Unfortunately, M. H. L. DE VILMORIN was unable to be present by reason of a family bereavement; whilst the broad Atlantic prevented the presence of Professor SARGENT. The other two—Mr. MALCOLM DUNN and Mr. F. W. BURBIDGE—were happily present, and the applause with which they were greeted suffices to show that the trustees had exercised a wise discretion in their choice. The work done by all four of the medallists is too well known, and too highly appreciated by the horticultural community, to necessitate any lengthened comment; but we may appropriately avail ourselves of the words of the President in making the respective presentations:—

HENRI LEVÉQUE DE VILMORIN, "for distinguished services to scientific horticulture."—The head of the firm of VILMORIN, ANDRIEUX & CIE., of Paris, which originated more than 150 years ago, and was established in the same locality in which the principal offices now stand—the Quai de la Mégisserie, in Paris. M. VILMORIN's great-grandfather became the head of the firm in 1781, after his marriage with the only daughter of the former head, M. ANDRIEUX, and from thenceforth it became known under its present title. From him (PHILIPPE-VICQOIRE DE VILMORIN), the headship has descended to the present M. HENRI DE VILMORIN, under whose direction it has grown in importance still more rapidly than under his predecessors, and has extended its business relations to all parts of the world where agricultural and horticultural seeds are in request. Besides the central establishment on the Quai de la Mégisserie, it has extensive seed warehouses in the Rue de Reuilly, large nurseries at Verrières near Paris, and at Antibes on the Mediterranean coast, for the cultivation of choice flower seeds; also seed-farms for the production of vegetable and other seeds. In these various establishments upwards of 400 hands are employed. All the Vilmorins who have directed the firm have been distinguished not less by their scientific acquirements than by their sound practical knowledge of horticulture and its requirements, but none in so high a degree as he whom we honour to-day. Under their direction various useful treatises on horticultural subjects have been issued by the firm from time to time, and among these the recently-published *Les Plantes Potagères*, prepared under the immediate care of M. HENRI DE VILMORIN, is unquestionably the best of its kind that has ever been compiled; it is not only a work of the highest utility to the gardening public at large, but it also possesses great merit from a scientific standpoint. It is worthy of note that the firm of VILMORIN & CIE., under the able direction of its present chief, has not only effected great improvement in many of the ordinary vegetables, but it has also pressed into service edible plants previously neglected, and introduced others for the first time into cultivation. M. HENRI DE VILMORIN is the recognised chief authority on horticulture in France, he is premier Vice-President of the Société Nationale d'Horticulture de France, he has travelled much and often, and has acquired an experience of horticultural matters probably unsurpassed by any living horticulturist.

F. W. BURBIDGE, "for eminent services to scientific horticulture."—Mr. BURBIDGE commenced his horticultural career as a student in the Royal Horticultural Society's gardens at Chiswick, whence he

removed to Kew, where he attended the lectures on "Botany and Vegetable Physiology." While at Kew, he also attended the examinations in botany and horticulture held by the Society of Arts, at which he obtained several first class prizes and certificates.

From 1873 to 1877 he was one of the most active of the staff of *The Garden* newspaper started by Mr. W. Robinson. During this period he wrote several works on gardening subjects, including *Cool Orchids* (1875), *Domestic Floriculture*, still the best of its kind in the English language; *A Monograph of the Genus Narcissus, and Cultivated Plants* (1877), an excellent text-book for young gardeners.

In 1877—1878 he went on an exploring mission to North Borneo for the Veitchian firm, during which he visited the little-known Sulu Archipelago. This mission resulted in the introduction of several plants new to British gardens, including *Cypripedium Lawrenceanum*, one of the finest of the genus. Mention may also be made of *Burbridgea nitida*, a Scitamineous plant previously unknown to science, and upon which Sir J. D. HOOKER founded the genus, "in recognition of his eminent services to horticulture" (*Botanical Magazine*, t. 6493). After his return, Mr. BURBIDGE published a narrative of his mission entitled *Gardens of the Sun*, a work of considerable literary merit, and which doubtless did much to secure for him the honorary degree of M.A., conferred on him by the Dublin University in 1888.

In 1879 he was appointed Curator of the Botanical Garden of Trinity College, Dublin, to which was added the Keepership of the College Park in 1894. Mr. BURBIDGE is a Fellow of the Linnean Society of London, a member of the Royal Irish Academy, a life member of the Royal Dublin Society, a member of the Scientific Committee of the Royal Horticultural Society, and an honorary life member of the Scottish Horticultural and Botanical Society.

MALCOLM DUNN, "for eminent services to horticulture and Forestry."—Mr. DUNN was appointed to the Dalkeith Palace Gardens in 1871 in immediate succession to WILLIAM THOMSON, one of the most successful Scotch gardeners of his time, and the best cultivator of the Grape-vine. By his untiring energy the high reputation of the Dalkeith Gardens was fully maintained by Mr. DUNN, and they are known far and wide to be among the best managed north of the Tweed.

Mr. DUNN's exertions in the cause of horticulture have not been confined to his own immediate sphere. In the same year in which he became head gardener at Dalkeith he was elected to the Council of the Royal Caledonian Horticultural Society, a position he has held ever since with the exception of short intervals of one or two years at the end of every six years, the term for which every councillor is elected. He has also been on the Council of the Scottish Arboricultural Society since 1872, and has served twice during this period a three years' term as Vice-President, a position that involves many onerous duties. He was one of the originators of the great Forestry Exhibition held in Edinburgh in 1884, which contributed much towards bringing before the British public the importance of scientific forestry as applied to the profitable planting of trees on waste and other lands in this country. But Mr. DUNN's most enduring service to arboriculture has been the collecting of materials from which he compiled the statistics of Conifers published in the Report of the Conifer Conference of the Royal Horticultural Society held at Chiswick in the autumn of 1891.

Besides the official positions held by Mr. DUNN in the above-named societies, he is also a member of the Scottish Horticultural Association, instituted in Edinburgh in 1877 to promote the cultivation of florists' flowers (*Chrysanthemums*, &c.), of which he filled the office of President for the first five years. He is also a Fellow of the Royal Horticultural Society, of the Edinburgh Botanic Society, of the Highland Agricultural Society, and several others.

Professor C. S. SARGENT, "for eminent services to scientific forestry and arboriculture."—The Director of the Arnold Arboretum, near Boston, Massachusetts, the most complete of its kind in North America, and planted under his own superintendence. The Pro-

WATER-HYACINTHS, PONTEDERIA CRASSIPES, BOTANIC GARDEN, PORT DARWIN.

essor has long been known in Europe as well as in America as one of the most able exponents of arboriculture; his knowledge of hardy trees, especially of those of N. America, is profound. His great work, *The Sylva of North America*, now complete to the end of the ninth volume, will long remain an enduring monument of his scientific labours. Scarcely less valuable are his smaller works on *The Forest Flora of Japan* and *The Woods of the United States* [and his Teuth Census Report on the Trees of the North American Continent]. Also his papers contributed to the *Garden and Forest*, of which he is chief Editor. His powerful protests against the wanton and wasteful destruction of the Coniferous forests of the Pacific and other States have unquestionably done much towards bringing about the intervention of the Legislature and the establishment of "reserves," &c.

This pleasing ceremony over, the fellows present were entertained and instructed by a singularly lucid account of the movements exercised by the various parts of plants in the course of their growth, and in response to various stimuli. The lecture was delivered by the Rev. Prof. HENSLow, and illustrated by numerous lantern-slides thrown on the screen, and taken mostly from DARWIN'S *The Power of Movement of Plants*. A more instructive lecture has rarely been delivered before the Society.

**PONTEREDIA CRASSIPES** (see Supplementary Illustration).—In this country we value this aquatic-plant for its singular leaf-stalks, inflated like a balloon. By their agency it is enabled to float on the surface of the water. It is not so infrequent inmate of our stove-aquaria, where its spikes of blue flowers are occasionally seen, but such a mass of flower as is shown in our illustration, is not likely to be witnessed here. Our illustration is taken from a photograph obligingly furnished by Mr. NICHOLAS HOLTZE, Curator of the Botanic Gardens, Palmerston, Port Darwin.

**LINNEAN SOCIETY.**—At the annual meeting held on Thursday June 4, Dr. GÜNTHER was elected President in the room of Mr. C. B. CLARKE, resigned. The other officers continue their valuable labours. The Treasurer, Mr. CRISP, found it necessary to give a warning against disproportionate expenditure, but as the expenditure was chiefly devoted to publications and to the improvement of the library, while the reserve-fund is still in a satisfactory state, in spite of sundry sellings-out, the Fellows did not appear to be made very anxious by the Treasurer's forecasts. Nevertheless, it is obvious that means must be taken either to increase the income of the Society or to lessen its expenditure, which latter could not be done without impairing the value of the Society. The Linnæan Medal, given alternately to a botanist and to a zoologist, was this year awarded to Professor ALLMANN, a former President of the Society. The medal was received on Dr. ALLMANN'S behalf by Sir JOSEPH HOOKER, who, in felicitous terms described the career of the distinguished naturalist, which, he said, had been passed, as it were, in the shadow of LINNÆUS, from the time when the youth took delight in determining the plants he collected by means of SMITH'S *Flora*, till the present, when the Linnæan Society conferred upon the venerated Professor the highest honour it is in its power to bestow.

— On the occasion of the evening meeting, to be held on June 18, at 8 P.M., the papers to be read are:—1, "On the Inter-muscular Bones of Fishes," by Professor T. W. BRIDGE; 2, "On the Relation of the Growth of Foliage-leaves of the Chlorophyll-function," by Professor MACDOUGAL; 3, "On the Value of Specific Characters," by Dr. A. R. WALLACE, F.R.S.; 4, "Descriptions of some New Species of Forficulide, in the Collection of the British Museum," by W. F. KIRBY, F.L.S.; and, 5, "On the Epiphragm of *Helix aspera*," by Professor G. J. ALLMAN, F.R.S., F.L.S.

**GARDENERS' ORPHAN FUND.**—We may remind our readers that the annual dinner of this excellent

institution will be held on Thursday, June 18, at the Hôtel Métropole, Northumberland Avenue. His Grace the Duke of BEDFORD, maintaining the traditions of his house, will preside at the festival. We earnestly hope that he will be well supported on the occasion.

**THE BOTANICAL MAGAZINE.**—The June number contains coloured figures and descriptions of the following plants:—

*Agave larifolia*, Baker, a caulescent species, with finely serrulate leaves and tall scapes, bearing globose heads of flowers arranged in loose terminal racemes, Royal Gardens, Kew; t. 7477.

*Habenaria Elwesii*, J. D. Hooker. A green-flowered species, with deeply-divided petals, and a horn-like process on the lip at the mouth of the spur, on the side opposite the column. Native of the Nilghiri Hills. Flowered in Mr. Elwes' garden at Colesborne; t. 7478.

*Phaius mishmensis*, Rehb. f. In this species the racemes of flowers proceed from the side of erect leafy stems. Each flower is about 2 inches across, dark rose-coloured, with a yellow spur. The species is a native of the Eastern Himalaya, whence it was introduced to Kew by the Earl of SCARBOROUGH; t. 7479.

*Eranthemum reticulatum*. A stove shrub described in these columns in 1875, vol. i., p. 619. [Oct. 3, 1874, p. 430.] It has ovate-lanceolate green leaves, speckled with golden variegation; t. 7480.

*Episcia densa*, C. H. Wright. A native of Demerara, with long stalked oblong-acute leaves, claret-red on the under-surface. The yellow tubular flowers are in clusters, the outer surface of the calyx-lobes red, like the dorsal surface of the leaf, green within; t. 7481.

**NATIONAL VIOLA SOCIETY.**—A meeting of the committee, presided over by Dr. SHACKLETON, of Sydenham, was held in the Museum of the Royal Botanic Society, Regent's Park, N.W., on the 8th inst. The hon. secretary, Mr. A. J. ROWBERRY, reported a rapid development of the society, nearly 100 members having been enrolled during the past two months. Final arrangements were made for the show to be held in the Botanic Gardens on the 20th inst., when it is anticipated that a very fine display will be made, the recent rain coming at the right time for the growth of exhibition blooms.

**GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—We are asked to acknowledge the following contributions, which were omitted in a former list, making the total amount received as a result of the Festival Dinner, £2200:—

Mr. George Monro's List ... 25 0 0	(including his and Mrs. Geo. Monro's donation of £5 ss. each).	Per Mr. N. Sherwood ... Messrs. Haage & Schmidt ... 1 1 9	Per Mr. Sherwood—Cont. Mr. E. F. Fitch 1 1 0 Mr. David Smith 3 3 0 Mr. Jameson ... 3 3 0 Messrs. Dippe Bros. ... 1 0 0 Thames Bank Iron Co. per Mr. W. Y. Barker ... 17 17 0 Per Mr. H. J. Cutbush ... 11 11 0
------------------------------------	--	---	--

— Arrangements are being made, we believe, for holding a meeting for the furtherance of the aims of this society on the 17th inst. in the Gala Field at York. The committee has granted the use of their tent, and the meeting will be held at 4 o'clock. The Right Hon. the LORD MAYOR OF YORK has been asked to preside, and among those who are expected to address the meeting are Sir TREVOR LAWRENCE, Bart., Mr. H. J. VEITCH, and Mr. G. J. INGRAM, the Society's secretary. The local hon. secretaries are Mr. H. J. CLAYTON and Mr. McINTOSH. We wish the meeting every success possible.

**THE AGRICULTURAL SEED TRADE ASSOCIATION. 6, MARKET BUILDINGS, MARK LANE, LONDON, E.C.**—On Monday, 1st inst., the annual dinner of the Agricultural Seed Trade Association was held at the Holborn Restaurant, HERBERT LE MAY, Esq., in the chair, ARNOLD MOSS, Esq., being Vice-Chairman. After the usual preliminary toasts, the leading toast of the evening was proposed by the chairman in the following terms:—"I now have to

propose to you the principal toast of the evening, viz., 'Success to the Agricultural Seed Trade Association.' This society, formed in the interests of those engaged in the seed trade, has gradually grown until it now numbers amongst its members all the leading firms. One amongst the many objects for which the association was started was the settlement of disputes between the members without recourse to law, and in this, as you are well aware, it has been thoroughly successful, many a small difference being settled amicably by arbitration which otherwise might have grown into a costly law-suit. It has done most excellent work in the past, and I have no doubt that under the hands of the present able directorate, it will continue to flourish in the future."

**LA MORTOLA.**—The MARCHESE HANBURY sends us the following list of some interesting plants at present in flower in the open air at La Mortola, near Mentone:—

Agave ferox	Isomeris arborea
Anthoecercis littorea	Isoplexis canariensis
" viscosa	Isopogon formosus
Banksia gracilis	Laurus Camphora
Bauhinia candida	Leucadendron globularia
" bryoniifolia	Lotus pelorhynchus
Brachyichiton populneum	Lycium atrum
Burchellia capensis	Obolontospermum maritimum
Cesalpinia sepiaria	Pavonia premorsus
Cantua bicolor	Persea gratissima
Capparis spinosa	Pilocarpus plantifolius
Carpenteria californica	Pithecolobium buccinatorum
Cheiranthus mutabilis	Quilaja saponaria
Convolvulus floridus	Raphiophyes rubra
" oleifolius	Rogiera litifolia
Echinocereus argyrenus	Rosa Rupini
Franciscia eximia	Roupala Pohlil var. multifluga
Goldfussia isophylla	Rulingia corylifolia
Grevillea buxifolia	Samolax officinalis
Grewia occidentalis	Sterculia acrifolia
Haplocarpha scaposa	Strelitzia Reginae
Heuchera sanguinea	Toxicophlea spectabilis
Hymenopodium flavum	Trachelospermum jasminoides
Lochroma grandiflora	Veronica Girdwoodiana.
" fuchsoides	

**BEAUMONTIA GRANDIFLORA.**—We have received a well-developed flowering truss of this magnificent warm greenhouse plant. It should be grown on the back or end wall of all large greenhouses, where if well planted in a border it will reward the cultivator with a profusion of its large fragrant trumpet-shaped white flowers in the generality of years. It was figured in the *Gardeners' Chronicle* for May 8, 1886, from materials furnished from Panshanger, Lord COWPER'S Hertfordshire seat. The present sender of the flowers is Mr. R. MARIES, nurseryman, at Lytham, who states that a plant which has been growing in an intermediate-house, possesses thirty-eight heads of bloom, similar to the one sent to us.

**FRENCH STRAWBERRIES.**—We note in the newspapers that the Strawberry cultivators in the North of France are sending their early produce direct to Plymouth, *via* St. Malo, by special steamer, and during the first week of running the vessel employed in the conveyance of the produce made four trips, landing 120 tons of Strawberries and Peas. Our season is just beginning, and will last a month, long before the end of which the French Strawberry season will be practically over; and we would suggest that English, Irish, and Scotch growers might very well add to their incomes by sending Strawberries, Cherries, Gooseberries, &c., to that country—i.e., if this Protectionist tariff in force is not practically prohibitive. Surely we possess the true trade instinct in as great a degree as the French—at least, they never tire of calling us a nation of shopkeepers.

**THE WOODMAN MEMORIAL FUND.**—It appears, from a statement made by the Hon. Secretary, Mr. NAPPER, 489, King's Road, Chelsea, that enough money has been raised to provide for the erection of an inexpensive but suitable memorial to Dr. WOODMAN, late of the Exeter Nurseries. The best form of memorial, one that would relieve the necessities of the widow, has still to be raised. The few pounds that remain after the payment of the cost of the monument may serve as a nucleus around which, it is to be hoped, a substantial sum may accrue.

**MR. J. BURTT DAVY**, as we learn from *Erythraea*, is now investigating the vegetation of the alkali areas of the Upper San Joaquin Valley, in California.

**SOILS AND COMPOSTS.**—We are glad to announce the publication of a small treatise on this subject from the competent pen of M. GEORGES TRUFFAUT, who, to a knowledge of chemistry and biology, adds that of a practical cultivator. We shall take another opportunity of alluding to M. TRUFFAUT'S *Sols, Terres et Composts utilisés par l'Horticulture*. In the meantime we may say that it is published by M. OCTAVE DOIX, 8, Place de l'Odéon, Paris.

**STOCK-TAKING: MAY.**—The political weathercock has had a turn about since last we reported on the Trade and Navigation Returns: what hard times our folks may have had in the matter is of no account here, only with results have we to deal, and these, to some extent, are of importance. In *primis*, according to the Board of Trade Returns for May, just issued, our importations have fallen off to the tune of £1,402,098, as compared with the figures for the same month in 1895. But we are to the good by £11,473,114 on the five months' imports, as compared with the same period last year: the figures for the five months in 1895 being 169,830,616, and for the past five months £181,303,730. The increases in the past month's imports are to be found in live-stock (£130,722), tobacco (£64,469), metals (£194,666), raw materials (£11,406). Our usual excerpt from the "Summary" table is as follows:—

IMPORTS.	1895.	1896.	Difference.
	£	£	£
Total value of imports	34,752,086	33,349,988	-1,402,098
(A.) Articles of food and drink—duty free ... ..	11,815,499	10,628,933	-1,186,566
(B.) Articles of food and drink—dutiable	1,734,648	1,716,187	-18,461
Raw materials for textile manufactures ... ..	5,794,849	5,615,257	-89,592
Raw materials for sundry industries and manufactures	3,471,679	3,483,985	+11,400
(A.) Miscellaneous articles ... ..	1,168,445	1,141,978	-27,367
(B.) Parcel Post ... ..	81,550	58,267	-23,282

Respecting the imports of fruits, roots, and vegetables, the following little table will be found to possess its usual interest:—

IMPORTS.	1895.	1896.	Difference.
<b>Fruits, raw:—</b>			
Apples ... .. bush.	83,260	88,252	+4,992
Cherries ... .. "	11,782	7,170	-4,612
Plums ... .. "	242	853	+611
Pears ... .. "	299	14	-285
Grapes ... .. "	2,706	2,914	+208
Unenumerated ... .. "	58,965	74,425	+15,460
Onions ... .. "	337,341	501,217	+163,876
Potatoes ... .. cwt.	598,456	530,959	-67,497
Vegetables, raw, unenumerated ... .. value	£118,701	£98,192	-£20,509

Although in the important matter of

#### EXPORTS

we have to record an increase in value for the month of £468,183, it is very evident that the aforesaid weathercock has had something to do with the limited expansion of trade. There is a shuffling of the political cards going on in the United States, which cannot fail to do harm to trade for some months to come. The items which show a decrease are live stock, raw material, yarns and textile fabrics; chemicals, machinery, and articles of wearing apparel, still continue to show a favourable aspect. It may be worth noting that the increase on five months is given as £10,155,253—the figures being, for five months last year, £98,317,416, and for the past term is £98,472,669. More need not be said, excepting that, like Master Twist, we wish for more.

**HOW TO LIVE?**—The enclosed letter affords some practical suggestions which we commend to all concerned:—"The Ragged School Union is now engaged in its great summer work of filling up the Holiday Homes with poor children from the indigent quarters

of the Metropolis. In their own homes there is hardly any approach to a rational style of diet. We therefore want them while at our Holiday Homes to learn, among other things, the corrective and nutritious properties of fruits and vegetables. Most of our homes are within easy distance of the great market-gardening and fruit-growing districts of the country. I should therefore be glad to hear from any market gardeners, fruit growers, &c., in Surrey, Kent, and Sussex, &c., who would like to forward to our Holiday Homes any gifts of fruits and vegetables. We have already been favoured with such gifts by several London firms, and they perform not the least valuable part in making a stay in our Holiday Homes of permanent value to our *protégés*. Our aim for fifty-two years has been to teach the children how best to live, alike in material, moral, and spiritual directions, and as it is in our Holiday Homes that we get complete control of our *protégés*, they there, in the course of a fortnight, so far as diet is concerned, not to mention

give up the plant, but this, in spite of the heavy sum which he had paid for it, he declined to do. The sum of 300 guineas is the highest ever paid for an *Odootoglossum*, being about double the sale price of *O. crispum* var. *apiatum*.

**BOTANICAL ANACHRONISMS.**—In the fine panorama of "Rome in the time of Constantine" (A.D. 312), now on view at the India Exhibition, groups of magnificent Agaves are shown. *Opuntias* clamber about the masonry, and in one place a stately *Dracena*, allied to *Cordylina indivisa*, is used most effectively. Unfortunately, the Agaves and *Opuntias* are of American origin, whilst the *Dracena* is derived from New Zealand! The plants were not known for more than a thousand years after the time of Constantine. Stately *Cypresses*, and distinct-looking Stone Pines, are more in place. It is needless to say that, from the artist's point of view, the plants in question add greatly to the effec-

F. W. BURBIDGE, M.A.  
(Veitch Medallist. See p. 734.)

other matters, learn better how to live than they possibly can do in their own homes. So if in the important direction I have indicated readers of the *Gardeners' Chronicle* can help, I shall be extremely grateful. That we also need, and shall gratefully welcome, money contributions I need hardly say. *Holiday Homes Fund, Ragged School Union, 37, Norfolk Street, Strand, W.C., John Kirk, Secretary.*"

**ODONTOGLOSSUM AUGUSTUM.**—We learn from *Le Journal des Orchidées* for June 1 that the specimen of *Odontoglossum augustum* shown in bloom for the first time at the recent Temple show by MM. DALLEMAGNE & CIE., of Rambouillet, was sold for an unprecedented sum. Various offers were made for the specimen as soon as it was unpacked and staged. Two hundred guineas were offered by one enthusiast; then, by other bidders, 250; finally, Mr. BACKHOUSE, of York, promised 300 guineas if the plant might be his. But M. JULES HYE, of Ghent, had made the first offer, regardless of price, so that he became the fortunate possessor of the treasure. At the end of the day M. Hye was offered 50 guineas if he would

tiveness of the panorama; but the botanist might fairly think, if the artist permitted himself such an amount of inaccuracy in the one case, his version of the architectural details might be equally wanting in verisimilitude. The vegetation of modern Rome differs conspicuously from what it must have been in the time of Constantine.

**ON BEHALF OF THE REPORTER.**—The interest felt by horticulturists in town and country would not be increased, if when they received their *Chronicle*, *Journal*, *Garden*, or other gardening paper the lists of certificated plants shown at the meetings of the Royal Horticultural Society were scanty, garbled, or inaccurate. That this misfortune has seldom befallen them is due, in great measure, to the industry and carefulness of the reporters in the service of those journals, little help being accorded by the officials, who draw up the lists of such plants, &c., generally absurdly mis-spelt and inaccurate. It would conduce to a proper inspection of the plants, &c., as well as to rapidity of note taking if tables or parts of tables were set aside for the exhibition of

certificated subjects. On these, Orchids, florists flowers, border flowers, hardy shrubs, hothouse, greenhouse plants, bulbous plants, hardy fruit, hothouse fruit, and vegetables might each be assigned a place, and not mixed up promiscuously. The tables should occupy a prominent position in the Hall, and be readily accessible by the visitors and those whose business it is to attend these meetings. We are sure that the new superintendent of Chiswick, who, at present, it may be hoped, is unfettered by red tape or long usage, could readily carry out this welcome change.

**FRUIT FROM AUSTRALIA.**—Mr. J. B. THOMAS, of Covent Garden Market, showed in the Floral Hall, Covent Garden, on Wednesday and Thursday, 10th and 11th inst., a quantity of choice Australian fruit sent over by the Government of Victoria for exhibition here. The fruit, which consisted principally of Apples, had an extremely fine appearance, high in colour and clear of skin. The varieties included

as it is probably through these spaces that the micrococci, capable of infecting the parenchyma, are introduced. Again, it is essential most carefully to test tubers of RICHTER'S Imperator before planting them. And, as it is to be feared that these micrococci exist in a latent state in the soil of the field whence tubers are harvested containing the germs of infection, it is advisable, after a time, to use the ground for some other crop than that of Potatoes. It is by these preventive measures that those infinitely small creatures known as micrococci can be most successfully fought against.

**"BULLETIN DE L'ASSOCIATION POUR LA PROTECTION DES PLANTES."**—The Association was formed in 1883, to check the extermination which threatened many of the rarities and interesting plants of Switzerland. By directing public attention to the subject, no doubt much good has been effected. It will be a misfortune if the increased attention

and successful a part. The three brothers are well known in Essex and Suffolk, and their prowess won them many friends, many of whom will doubtless regret their retirement.

**A NEW VEGETABLE.**—In a recent number of the *Revue Horticole* M. André calls attention to the use of the roots of *Aralia edulis*, alias *A. cordata*. The plant is a native of Japan, and its roots have an aromatic taste which may not be agreeable to all palates. We hope the Royal Horticultural Society may see its way to try it at Chiswick. It may be had from M. Saillier of Neuilly, near Paris.

**A GIFT TO ABERDEEN.**—We learn that Mr. HARPER, the head gardener at the Duthie Park, Aberdeen, has received from Sir WILLIAM BROOKS, Bart., of Glen Tana, Aberdeenshire, a very fine collection of Orchids for cultivation in the park. The gift is much appreciated.

**A ROSE FETE AND BAZAAR** will be held at the Queen's Hall, Langham Place, W., on Tuesday, Wednesday and Thursday, June 23, 24 and 25, in aid of the North-Eastern Hospital for Children, Hackney Road, Shoreditch. Chairman of the Rose Show Committee: J. B. Scott, Esq., Hillhead, Broxbourne. The Committee are organizing a great exhibition of Roses, and appeal to our readers to help them. Prizes (gold and silver medals) will be offered in the following classes:—

*Amateurs.*

A. Class I. 24 Cut Roses in Stands (distinct varieties named), 2 prizes; Class II. 12 ditto, 2 prizes; Class III. 6 ditto, 1 prize; Class IV. 12 ditto (of one variety), 2 prizes; Class V. 6 ditto, 1 prize; Class VI. 12 ditto, Teas and Noisettes (distinct varieties named), 2 prizes; Class VII. 6 ditto (in threes), 2 prizes; Class VIII. 12 Button-hole Roses, in bunches of three, 2 prizes; Class IX. 6 ditto, 1 prize; Class X. Basket of Roses, 2 prizes; Class XI. Table decoration of Roses (6 feet x 3 feet), 3 prizes; Class XII. Garden Roses in bunches of six, 1 prize; Class XIII. Lady's spray of Roses, 1 prize.

*Professional Growers.*

B. Class I. Group of Roses for a space not exceeding 50 square feet, 3 prizes.

C. The Committee also ask for quantities of cut Roses for decoration (in baskets or otherwise), and will be much obliged for any kindly forwarded for that purpose.

Donors of Roses for decorative purposes are requested to forward them to the Queen's Hall, between 9 and 11 a.m. on one of the three days. The prizes will be awarded by well-known Rose growers. Each exhibitor will receive a free admission to the bazaar. Further particulars may be obtained of T. GLENTON-KERR, Esq., Secretary, 27, Clement's Lane, E.C.

**NEW PUBLICATIONS.**—*Journal of the Kew Guild* (will be noticed shortly).—F. BOYLE, *Über Orchideen*, translated by Professor KRÄNZLIN (Berlin: PAUL PAREY).—*Cottage Gardening*, edited by W. ROBINSON, F.L.S.; Vol. 7 (CASSELL & Co.).—*Lloyd's Natural History: British Birds, Part I*, by W. BOWDLER SHARPE (E. LLOYD).—*Die Rüben Nematoden*, by JOHANN VANHA and JULIUS STOLASKA (Berlin: PAUL PAREY).—*Natur und Haus, illustrierte Zeitschrift für alle Naturfreunde*, fourth year of issue, No. 9, ROBERT OPPENHEIM (GUSTAV SCHMIDT), Berlin.—*English Mechanic and World of Science*, May 29 (Strand Newspaper Co., Ltd., 332, Strand; also the International News Co., Canada and U.S.A.).—*Les Nepenthes et Leur Culture*, par JULES RUDOLPH (OCTAVE DOIN, 8, Place de l'Odéon, Paris). A useful illustrated handbook containing descriptions and cultural notes of various species of Nepenthes.—*27th Annual Report of the Fruit Growers' Association of Ontario*, 1895. This contains papers on Apple Culture, Fruit Exhibitions and how to make them educative, Top grafting on the Tolman Sweet, Spraying and cultivation of Orchards, and other important subjects.—*The Farm Magazine*, May (W. M. GOODMAN, Editor and Manager, OGDEN BROS. & Co., Publishers, Knoxville, Tenn.). A very satisfactory number.—*Le Jardin du Crest*, par MARC MICHELL.

MALCOLM DUNN.  
(Veitch Medalist. See p. 734.)

London, New Rock, Sturmer, and Stone Pippins, Stewart, Gooseberry, and King of Tomkins County, which are names well known in gardens in this country; others less well known, or not at all, were the varieties Jonathan, Rokewood, Yate's, Callasaga and Nickajack. The few Pears included in the consignment were well-developed nice fruits, but their names did not transpire. Most, if not all, of the fruit came from the colony of Victoria, and some Pumpkins and Squashes were included. This lot of seventy-five cases, which are, we suppose, merely samples of what the colony can send us, should find ready sale at remunerative prices.

**POTATO BACTERIA.**—M. E. ROZE has recently published a paper on the Bacteria affecting the Potato. The researches which he chronicles were undertaken with a view to ascertaining how best to prevent or combat with the species of micrococci known to produce the scab. The conclusions at which he arrives are the following:—That it is absolutely necessary to avoid planting such tubers of Potatoes as have more or less corky defects upon them

given to these plants prove the cause of their destruction, as is happening with some Orchids. The necessity for botanic gardens and herbaria is emphasised by the fact that those institutions bid fair in some cases to be the only refuges left.

**"THE BOTANICAL GAZETTE,"** the representative of botanical progress in the United States, has passed into the hands of the University of Chicago. No change is made in the editorship, and the journal is to be not merely the organ of the botanical department of the University, but is to be more freely open to the botanists of the world than it has been in the past.

**PHOTOGRAPHS OF ORCHIDS.**—In the last number of *Knowledge* is a series of representations of Orchids, from the collection of the Right Hon. J. CHAMBERLAIN.

**THE BROTHERS KING.**—It will interest some of our readers to learn that Messrs. H. T., S. J., and L. G. KING, seed merchants, of Coggeshall, have retired from the football field, wherein they played so long

## HOME CORRESPONDENCE.

**SPRING CABBAGES.**—In the column dealing with this subject in the last issue, one not unimportant point has been entirely overlooked, i.e., that Cabbages are supposed to be grown to be eaten, and some of the sorts which are often very highly praised are little or no use for this purpose. There is a greater difference in the flavour of Cabbages than in Strawberries or Peas, and some varieties, such as Myatt's Offenham and Clibran's Tender-and-True, may fairly rank amongst the finer class of vegetables, being welcome as a change from Peas or Asparagus. Other Cabbages, similar if not identical in appearance and habit, may be useful to sell, but they are either rank or flavourless, and even if they were better in any other respect, which is very doubtful indeed, their inferiority as a table vegetable should entirely condemn them. This matter has been brought forcibly before us recently; we have been accustomed to purchase spring Cabbages grown in the south before our own were ready, and this year, after several trials, we failed to obtain any which we considered fit to eat, and we simply stopped buying, as did many of our friends who found the same fault. It is a pity that a good and profitable trade should be damaged or lost through ignorance or carelessness of this kind. In our experience, on light sandy loam, Myatt's Offenham is in every other respect equal to the best, and it has the special advantage of being unequalled in flavour, and also of being singularly free from the atrocious stench emitted by most Cabbages whilst being boiled. We have only had one season's experience with Clibran's Tender and True; it is very similar to the Offenham, but does not appear to be quite so perfect in flavour, and, of course, if the flavour is to have the first consideration, nothing but the white heart should be used. *Thos. Fletcher, Grappenhall, Cheshire.*

**FLOWERING PLANTS AT LA MORTOLA.**—One of the greatest charms to be experienced in the whole of the Riviera is to visit this garden in the month of April or May, where the greater part of our greenhouse plants are growing and flowering luxuriantly in the open air. One of the most striking plants at the time of my visit was the Pigeon-beak Lotus, *Peliorhynchus*, which was hanging over the sides of terrace walls, ablaze with its bright scarlet *Clinanthus*-like flowers. No spot seems too dry and sunny for its well-being. If cultivated in England in hanging-baskets in the full sun, I am sure it would make a fine plant for conservatory work. I saw a plant last year at Cannes that had covered a space of over 12 feet square in less than two years. Amongst other plants, one of the most striking was *Cantua dependens*, in large bushes, and bending under the weight of its trusses of red funnel-shaped flowers. *Echium arboreum* in variety was finely flowered in several parts of the garden. The pretty blue *Francisca eximia* was covered with flowers, and *Solanum crispum*, with its great heads of blossom was a sight one scarcely would have expected to meet with in the open air. Large bushes of *Genista monosperma*, 6 to 8 feet high, and nearly as much in diameter, were one mass of blossom, the pearly-white flowers being very distinct amongst the many other flowering plants around it. *Olearia stellulata* was profusely flowered, and a much purer white than it is generally seen in England. A most interesting plant was *Moraea* (*Iris*) *Robinsoniana*, in good health, and throwing up four or five flower-spikes. *Kennedia nigricans* as a creeper, is an uncommon-looking plant, with flowers having black corolla and green calyx. A host of *Polygalas*, *Grevilleas*, *Hakeas*, and a multitude of other plants were seen in such profusion and variety of blossom, and the natural effect produced, combined with the notes of the blackbird and nightingale was such, that led one to wonder if the garden of Eden could have been more charming. *Riviera.*

**A FLOWER MISSION.**—It has occurred to me that a quiet work, which is being done to brighten the lives of some of our London toilers "behind the scenes," might be of interest to your readers. I refer to the "Flower Mission to the London Workrooms." Once a week a few ladies meet together to make up into tasteful little bouquets the flowers sent up by country friends; texts are also attached to the bouquets, and they are then taken to different workrooms belonging to the shops to which an entrance is kindly permitted by the managers, in some of the principal thoroughfares. The flowers and their bearers are eagerly welcomed, and hearts are cheered by the little messages and loving words which are given with the flowers. One can understand that

these workers, whose everyday lives are so monotonous and unvaried, would be gladdened by the flowers, few of them ever having the opportunities to see them growing in all their beauty. Perhaps some of your readers who have more than sufficient flowers in their own gardens, might like to share them with those who have so little brightness in their lives. If so, weekly or occasional gifts would be most gratefully received by the Flower Mission Secretary, Clondesley Institute, 34, Barnsbury Street, Islington, N. on Thursday mornings. All gifts would be acknowledged, and hampers returned if addressed label is enclosed. *E. C. C.*

**LONDON IN MAY** (continued from p. 682).—**BATTERSEA PARK.**—I have generally gone here to see Mr. Gibson or his successors, and the sub-tropical gardening, in the autumn. This year I went to see the trees and shrubs, and what bulbs or flowers might be found at Battersea in May. The trees and shrubs were all that one could desire. The mild winter has stimulated our hardy trees and shrubs to do their best this season. The contrast between the two Mays, 1895 and 1896, is violent in the extreme. At Battersea and elsewhere frost-bites and scars were the order in May, 1895. This May all such *contretemps* were conspicuous by their absence. On the 16th of this May not a sign or trace of frost injuries could be seen. Bedding-out was also proceeding merrily, a few days too early according to my experience, confirmed by the cold rains and big hailstones we have had in East Anglia on the 20th and 21st. I hope no hail, with its almost absolute certainty of night-frosts afterwards, fell on these days at Battersea Park, to the chilling of the newly-planted-out bedding-plants. But it is quite too late to see what the grouped bulbs had been, and altogether too early to estimate what the summer or subtropical plants will grow into. Suffice it to say for the present, that the Park roads, walks, and grass, were in good condition, though showing traces of the dry May; that the trees and shrubs have bulked greatly into verdure and beauty within the last few years, and that this fine park and gardens seem to be growing in popularity every year. I was told that the cyclists had taken possession. But though the latter were exceptionally numerous, the general public still preponderated in all directions. The flowering and growing trees and shrubs were also everywhere at their freshest and best. The lake, like that of the Victoria Park, is also rapidly ripening and mellowing into beauty. It is often said that all true landscape gardeners should or must be poets. There is much truth in this. But there is more in the statement that they are bound to be prophets. Unless they can foresee the future they cannot well, truly, broadly, and wisely lay the foundations of true art and beauty in the present. Foresight is as essential as sight and taste, and needs more genius than either. If any fault can now be found in the lake and its environments at Battersea Park, it may readily be remedied by a richer variety of colour and form in the plants and shrubs—more graceful drooping down from the banks to rest on the water; and a richer clothing of banks and lake with such plants as Flag Irises, Horsetails, Bulrushes, Water Lilies, &c. *D. T. F.*

**VEITCH'S CHELSEA GEM AS AN EARLY PEA.**—From this variety, sown outside in the first week in February, we gathered our first dish on May 23. In this district many acres of agricultural land are now devoted to the cultivation of culinary Peas, and picking began with the first week in the present month. Owing to the drought, the early Pea crop in many places will be unsatisfactory. *W. H. W., Moor Hall, Stourport.*

**EARLY STRAWBERRIES.**—As showing the earliness of the season here, I gathered ripe Strawberries on June 6, from plants growing unprotected on a south border, having a wall to the north. The varieties are Royal Sovereign, Scarlet Queen, and Laxton's Noble. They were layered into small pots last summer, and as soon as the plants were ready, they were set out on the same day, and all three are fruiting simultaneously. *J. Easter, Nostell Priory Gardens, Wakefield.*

**ROYAL SOVEREIGN STRAWBERRY.**—Herewith we send for your inspection a few sample fruits of "Royal Sovereign" Strawberry from runners planted in September of last year, and growing in an open field, the lay of which is direct north. We consider it a splendid acquisition as an early variety, and bound in time to supersede Noble and others, the flavour being good and the flesh firm, and well fitted

for sending to a distance. We picked fruits of Noble on the 4th inst. from plants growing on a south border, while Royal Sovereign, growing alongside, was only two days later. It throws a remarkably bold truss, and sets freely in inclement weather. Shortly after setting their fruit we experienced 2° of frost, but while others were partially nipped, the Royal Sovereign escaped, therefore we cannot speak too highly of it as a first-class variety. *R. Blackstock.* [A fine specimen. *Ed.*]

**ERINACEA PUNGENS** (p. 698).—You express a wish to know what degrees of cold this plant has stood at Bitton. I have had it for many years, and never knew it injured in any winter; but it was in great request, and in an evil hour I pulled my good plant to pieces, and gave more than half away. Some went to Kew, and I am glad to see by your account that it is doing well there. But the result to my own plant was a lingering death, and I should be glad to know where I could obtain a plant again. I grew it in full sun, but in a sheltered place. *H. N. Ellacombe, Bitton.*

**VIOLA COUNTESS OF MORAY.**—I am sending for your inspection some cut blooms and full-length growths of a new Viola called Countess of Moray. It is dwarf, only 6 inches high, carrying its blooms erect amongst a tuft of glossy-green leaves, and beautifully scented. I think when it becomes better known gardeners will find this Viola an effective and useful garden plant. *John W. McHattie, The Gardens, Strathfieldsaye, Mortimer, R.S.O., Berks, June 9, 1896.* [Flowers nearly 2 inches across, of good substance, flat, pale sulphur-yellow, lower petal deeper yellow; eye marked with short irregular lilac rays; plant robust. *Ed.*]

**HEUCHERA RUBIFOLIA.**—Last October I replanted two large beds of *Heuchera rubifolia* in new and carefully-prepared soil, chiefly fresh loam and old manure, as I have done repeatedly with the parents of these plants for some dozen years. Everything that we could think of was done to ensure success; but the result has been, that out of forty-three large clumps so treated, chiefly 9 inches to 1 foot across in breadth, twenty-four have withered up. The ground below is moist, and the remaining nineteen clumps are vigorous and in good health. I may add, that of the lesser parts not replanted after being dug up, one clump only out of some dozen has succeeded. I have called in my friend Mr. Cumming, who is a correspondent of yours, and well qualified to form an opinion. Similar results have occurred at times after removal (always effected carefully and with huge balls), but I have never experienced so sweeping a failure. I may say that I was introduced to the plant years ago by Mr. Ingram, of Belvoir Castle Gardens, and have grown it continuously ever since. *Edward A. Scott.* [We could find neither fungus nor insect. *Ed.*]

## SCOTLAND.

## ROYAL BOTANIC GARDEN, EDINBURGH.

The following species of plants were recently flowering in the Royal Botanic Gardens of the northern capital:—

## CONVOLVULUS CNEORUM.

A species which is a half-hardy one—one of the earliest introduced, cultivated in the Chelsea Botanic Garden in 1739, and figured in the *Botanical Magazine*, t. 459. It is shrubby in habit, with rather slender stems, which bear lanceolate leaves, covered with silky-grey hairs, giving it a distinct appearance. The terminal inflorescences bear whitish flowers, tinged with pink. It flowers for several months in the summer, and is propagated with ease; grows under rather dry treatment in the cool greenhouse, although it may occasionally be met with on walls and like positions in the south of England.

## PRIMULA REEDII.

This species, very rare in gardens, in spite of being a vigorous grower, is in flower at the present time. The scape carries four drooping flowers, in colour a creamy-white. The foliage is distinct, and the ovate-lanceolate leaves are covered with long silky-white hairs. Another species of *Primula* worthy of note is *P. imperialis*, better known in gardens under the name *P. imperialis*, about which there is a very interesting fact, namely, that the plant is found in

widely-separated countries—the Himalayan range and in Java. The stout flower-spikes bear whorls of yellow flowers, arranged in a bold manner, rising out of the dense crown of large light green foliage to a height of 12 to 18 inches. To grow this plant well a rich compost is necessary, and the pots, well filled with roots, should be stood in a saucer of water.

**COMBRETUM PURPUREUM.**

A plant of this lovely Madagascan climber is now in profuse flower in the Palm-house. There are about forty panicles of blossoms. It occupies a place amongst other roof climbers, and is planted beneath the stage in a special kind of soil.

**INCARVILLEA DELAVAYI.**

When better known this plant will probably become popular, on account of the beauty of its flowers, and the ease with which it may be cultivated. The tuberous rootstock attains to a large size, and the fleshy, pinnatifid, leaves are of a dark tint of green. The corolla is rose-coloured, the throat yellow streaked with purple. Although a plant flowered for the first time in this country in Sir Trevor Lawrence's garden in 1895, it has, I believe, been known in Continental gardens for some time. Mr. W. Thompson, of Ipswich, who flowered his plant in the open border where it withstood 32° of frost, had his plant under the name of *I. alpina*, which is merely a synonym. Seeds will germinate readily, and a stock of plants can therefore be easily raised. *R. L. H.*

**ANEMONE SYLVESTRIS, FLORE-PLENO.**

THE Snowdrop Anemone (*A. sylvestris*), a common European plant with single flowers, occasionally produces double ones, similar in most respects to that illustrated in fig. 128. We are indebted to the kindness of Mr. Gumbleton, of Belgrove, Queenstown, for furnishing the flower from which our illustration was taken. The plant was discovered growing wild in Germany; and although six days had elapsed since the flower was removed from it, it had preserved its freshness in a remarkable degree, the only shrivelling noticed was in what may be called the "guard petals," which had disappeared, and which our artist has not reproduced. The flower, like the type, is pure white.

**SOCIETIES.**

**ROYAL HORTICULTURAL.**

JUNE 9.—The high standard at which the ordinary meetings of the Society are now sustained was strikingly evident on Tuesday last, when a meeting was held in the Drill Hall, James Street, Westminster. Albeit this occasion is the first time the committees have sat since the large display was made at the show in the Temple Gardens, the capacity of the Hall was tested to the utmost, every part of it being inconveniently full. Though there was necessarily somewhat of smothering in many of the exhibits of hardy flowers, all of which were rich in varieties of herbaceous Peonies the show contained abundant specimens and groups of great interest, while in the gay picture presented, the exhibition could hardly be surpassed in the same area. A group of specimen plants of the hybrid *Streptocarpus* was of interest in the fact that it showed, in a manner such as has hitherto not been seen, how well they are suitable for cultivation as large plants. Orchids, as usual, constituted an important feature in the Hall, but the great bulk of the exhibits generally were from the outside garden. More fruit was staged than has been the case lately, and several first-class Melons were distinguished by awards. Strawberries were largely exhibited, H.M. The QUEEN staging a large number of varieties. Previous to the delivery of the lecture by Professor Henslow, the Veitchian Medals were presented by Sir Trevor Lawrence to the candidates selected by the Veitch Memorial Trustees (see p. 734).

**Floral Committee.**

Present: W. Marshall, Esq. (Chairman), and Messrs. Chas. T. Drury, H. B. May, H. Herbst, R. Dean, Robt. Owen, Geo. Stevens, C. J. Salter, R. B. Lowe, Thos. Feed, Geo. Nicholson, J. D. Pawie, J. T. Bennett-Poë, C. E. Shea, A. Selve Leonard,

Geo. Gordon, Edwin Beckett, James Walker, Harry Turner, H. H. D'Oonbrain, Ed. Mawley, R. M. Hogg, James Hudson, John Jennings, and J. Fraser.

J. T. BENNETT-POE, Esq., Holmeswood, Cheshunt, who frequently exhibits very successfully cultivated specimens of rare or handsome plants, on this occasion staged a magnificent plant in a tub of *Carpenteria californica*. The plant stood about 6 feet high from the ground, and was more than 3 feet through. The specimen was covered with the large white fragrant flowers, which have some resemblance to a glorified Mock Orange (Cultural Commendation).

Mr. POE also exhibited a plant of *Linaria macedonica* in bloom, and two hybrid *Cinerarias*, *C. Heritieri* × a garden *Cineraria*. A small plant of *Carpenteria californica* twelve months old, and carrying several blossoms, was likewise included.

MESSRS. GEO. COOLING & SONS, Bath, made an exhibit of sprays of garden Roses in numerous varieties. A few Moss varieties were noticed amongst them, but they are

doona and *Delicatum* were very noticeable. One of the early-flowering *Tritomas*, *T. caulescens*, was shown, a variety with Yucca-like foliage and straw-coloured flowers when fully expanded, but scarlet until open. Three spikes of the pale pink-flowered *Erenurus robustus*, about 7 feet high, were very conspicuous in the group (First Class certificate). The miscellaneous flowers included *Iris* in some variety, *Heuchera sanguinea*, the large-flowered *Pentstemon* (*Cobea*, *Antuericum*, and others). The group was faced with sprays of *Tropaeolum polyphyllum*.

A neat little group of *Cannas* in flower was also exhibited by Messrs. VEITCH & SONS. There were numerous varieties represented, of which the following appeared to us the most beautiful: Alphonse Bouvier, Paul Brunt, Kaiser Wilhelm II., all dark, self-coloured flowers; Comte de Bouchard, Progression, and L. E. Bailey, spotted varieties; and Cheshunt Yellow and Konigin Charlotte, edged varieties. *Caena Austria* was the largest-flowered variety exhibited; the dorsal and basal petals were 1½ inch wide, and more than 2 inches long. The side petals were wider but not so long, and were faintly spotted with pale red (Award of Merit). The groups were awarded a Silver-gilt Flora Medal.

From G. YELD, Esq., Clifton Cottage, York, came flowers of *Hemerocallis* varieties and *Iris*es. *Hemerocallis Apricot* is a hybrid between *H. flava* (seed-parent) and *Middendorffii*. The flowers of this one are large and of capital colour, but it has been previously exhibited. Other seedling varieties were shown, and also many seedling *Iris*es.

Mr. J. FRASER, Southwood, Essex, exhibited many seedling varieties of *Clematis*es, from deep lilac to pure white.

MESSRS. R. WALLACE & CO., Colechester, in an exhibit of very choice hardy flowers, included a number of *Brodiaea*s of very differing habit. Large spikes of the twining *B. volubilis* (pink), and *B. coccinea* (dull crimson), were shown, with *Brodiaea laya*, a blue-flowered species, with flowers a little like a miniature *Agapanthus*, though different in shade of colour. B. Howelli *lilacina* was awarded a First-class Certificate. The exterior of the tube is pale lilac blue, the apex of petals which form the corolla of the flower being silver coloured; about seven flowers are borne upon each umbel. *B. ixioidea erecta* (Award of Merit) has erect, star-shaped blooms, of denser habit, more compact, and brighter coloured flowers than the type. *Brodiaea capitata alba* has stiff, small, white flowers in a dense umbel, and *B. longata* is a similar habited one with purple blue flowers. Several varieties of herbaceous *Peonies* were shown, including some from Japan, in which the disc is supposed to resemble certain types of *Chrysanthemums*. Awards of Merit were granted to Mikado and Margaret Attwood, both of this type, the former rosy-crimson, the latter pure white, with yellow disc. The rest of the exhibit was composed of *Liliums* and *Calochortus* in many varieties, &c. (Silver Banksian Medal).

Mr. E. BECKETT, gardener, Aldenham House Gardens, Elstree, exhibited upwards of two dozen plants of the new strain of *Streptocarpus* hybrids. Most of the plants, which were two and three years old, were in 8 to 10-inch pots, with abundant foliage, and remarkable profusion of flowers (Silver Flora Medal).

Mr. ANTHONY WATERER, Knap Hill Nurseries, near Woking, exhibited about two dozen sprays of hardy *Rhododendrons* from seedling varieties, and as is usual from this establishment, the varieties and trusses were both very satisfactory (Silver Banksian Medal).

By C. F. THOMPSON, Esq., Mlandaff (gr., Mr. Mann), were exhibited cut flowers of *Pentstemon speciosus*, *P. secundiflorus*, *P. Wrightii*, *P. Menziesii*, *P. Barratye*, and *Antirrhinum*s, &c.

G. W. EWEN, Esq., The Lodge, Farnborough, Hants, exhibited blooms of a pink Rose, thought to be a sport from Henry Bennett, but apparently it is merely the old climbing variety, Blair No. 2.

MESSRS. PAUL & SON, Cheshunt, exhibited a group of hardy flowers, among which were numerous herbaceous *Peonies*, single and double. Mixed varieties of Spanish *Iris*es, *Pyrethrums*, single and double, *Lupinus arboreus* (yellow-flowered), *Potentillas*, *Gaillardias*, &c. *Cannas* were shown, including the pretty Cheshunt Yellow, the well-known Souvenir d'Antoine Crozy, and others. Czar Alexandra III., and Geo. Paul (Award of Merit), J. G. Baker are all self-coloured varieties of exceptional merit. A large display was also made by Messrs. PAUL of garden varieties of *Roses*, and of these there were Royal Scarlet, *Rosa macrophylla* (pink), and Paul's Carmine Pillar, all single-flowered effective sorts. The hybrid *Rugosa*, Mungo Park, a double crimson flower, was largely exhibited, and *Rosa rugosa fimbriata* is uncommon by reason of the fimbriated margin of the petals. This received an Award of Merit, as did also *Rosa rugosa* var. *Rose-apple*. There was also a collection of Sweet Briars (*Silver-gilt Flora Medal*).

A large display of hardy flowers was made by Mr. M. Pritchard, nurseryman, Christchurch. Spanish *Iris*es were well shown, and *Peonies* again formed a portion of the group. The rest of the exhibits represented many choice hardy flowers, now in bloom (*Silver Banksian Medal*).

*Caladiums* were shown by Messrs. J. PERD & SONS, Roupell Park Nurseries, Norwood Road, S.E., who had a group of small sized plants interspersed with *Ferns*, *Crotons*, and a few *Sonerilas* (*Silver Flora Medal*).

Mr. J. F. McLeod, gr. to J. P. Morgan, Esq., Dover House Gardens, Southampton, showed a plant of each of the choice self-coloured varieties of *Caladiums* known as Michael Buchner, Roma, and Ivalig.

More than two-thirds of one of the large tables was occupied by a magnificent display from Messrs. KELWAY & SONS,

FIG. 128.—ANEMONE SYLVESTRIS, FLORE-PLENO: WHITE. (Natural size.)

generally much less common in such collections than they used to be. Little Gem, Old Moss, Beranger, White Bath, Crested Moss, are the names of some of them. Sprays of Cooling's Single Crimson Bedder were shown with vigorous foliage, and very large single bright coloured flowers (*Silver Flora Medal*).

Mr. GEO. PRINCE, Oxford, made an exhibit of about three dozen blooms of the *Rose Comtesse de Nadailae*, the quality of them being very remarkable. Numerous specimens of *Murchal Niel* were exhibited, and miscellaneous varieties (*Silver Flora Medal*).

*Roses* were again exhibited by Mr. GEO. MOUNT, Exotic Nurseries, Canterbury. There were about six dozen blooms in the collection, and most of them were of capital quality, while others showed slight injury from the late rains (*Silver Banksian Medal*).

MESSRS. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, made a considerable display with a number of cut flowers of herbaceous *Peonies*, *Dolphins*, and miscellaneous species of hardy flowers. The group of *Dolphins* included a large number of varieties in very good condition, amongst which the sky-blue flowered varieties, Bella-

Langport Nurseries, Somerset. In this were included double and single Peonies, Gaillardias, Irises, Delphiniums, and some miscellaneous flowers. Awards of Merit were obtained by the two following varieties of Delphiniums: Geneva, a semi-double variety of a pale-blue colour, the inner petals faint pink; and Albert Edward, a very bold and effective plant, with single purple flowers. Amongst other things in this exhibit was noticed a white variety of *Scabiosa caucasica*, and a number of blooms of *Iris ochroleuca*, a species producing attractive flowers of pale cream and yellow (Silver-gilt Flora Medal).

In a group of flowering shrubs, &c., Messrs. JAMES VEITCH & SONS exhibited *Benthamia japonica*, the pretty, small, and numerously flowered *Abelia triflora*, a pure white variety of *Indigofera decora*, *Hedysarum multijugum*, *Cesalpinia japonica*, *Syringa japonica*, and *Syrax japonica*, an excellent white flowering shrub for decorative purposes.

THE GULFOFORD HARDY PLANT CO. made an exhibit of alpine and other plants growing on rockwork, in a manner imitative of Nature; and the firm obtained an Award of Merit for an Iris with foliage variegated with yellow, probably a variety of *I. pallida* (Silver Flora Medal).

MESSRS. H. CANNELL & SONS, Swanley, obtained an Award of Merit for a variety of *Regal Pelargonium* named *Persimmon*, described as a sport from G. Perkins. The plants shown were very profusely covered with rosy-crimson flowers, borne in large handsome trusses.

A table filled with grand examples of *Streptocarpus* was shown by Mr. BECKETT, Aldcumb House Gardens, Elstree. The plants were of varied and clear tints, and densely flowered, and were of an average height of 1½ foot. Twenty-eight plants were shown, and the award made was a Silver Flora Medal.

Some beautiful brilliant flowered varieties of *Canna indica*, many of them new and unnamed, were exhibited by Messrs. H. CANNELL & SONS, The Home of Flowers, Swanley. Besides the now well-known Queen Charlotte, Souvenir d'Antoine Crozy, Alphonse Bouvier, and Madame Crozy, there were the following named novelties:—Paul Meylan, in colour a deep orange, inclining to red, with some yellow colour in the centre; Beauté Poitevin, the entire bloom of a deep crimson colour; Golden Queen, rich yellow, regularly spotted all over with red; M. H. De-bouise, somewhat similar to the last named, but the spotting less; Amiral Avilar, not unlike the last named, but with rounder and broader floral segments, making it a bloom of great regularity of form; Sénateur Montehoré, orange-red with yellow spots near the edge; Pierson & Co., a deep crimson-coloured, well formed bloom; and President Canot, scarlet of a deep tint—a large flower. The plants had been grown in flower-pots in a greenhouse. A Silver Flora Medal was awarded.

MESSRS. CANNELL & SONS showed a good strain of white Intermediate Stock named *Camellia Camelliflora*, a pure white, with fully developed flowers of 2 inches in diameter.

MESSRS. DORRIS & CO., Rothsay, N.B., and Orpington, Kent, showed a miscellaneous lot of herbaceous perennials as cut blooms, including numerous species and varieties of Iris and *Pyrethrum roseum*. The rare *Draecophyllum Raysehanum* was remarked in the collection, a plant with unusually dark blue flowers. Other plants were *Apulegiaerulea* in variety, *Delphinium nudicaule*, *Dianthus Marie Pèrè*, with white blossoms; the new Sweet Pea, Extra Early Miss B. Ferry, which has been proved to be fourteen days earlier than the variety Miss B. Ferry. It has a pinkish standard and cerise-coloured wings. Of *Pyrethrums* there were noted *Gustave Herz*, *Gloire d'Italie*, *Queen Sophia*, *Virgo*, *Gaiety*, *nyctem plumum*, *Rev. J. Dix*, two good old varieties; *Leonard Kelway*, *Milton*, *Princess Metternich*, and *torbundum plumum*. A good collection of *Vicarias* in all sorts of tints, and fancy *Pansies* formed a considerable part of the exhibit, but for these the heat and drought in the south, whence presumably the plants had been grown, have been too much for them, for the blooms were rather small (Silver Banksian Medal).

MESSRS. BARR & SONS, florists and seedsmen, 12 and 13, King Street, Covent Garden, put up a large collection of hardy herbaceous perennials as cut blooms. The exhibit contained numerous species of Iris, of which plants the exhibitors possess a very fine collection; *Hemerocallis flava*, the showy *Dietamnus Fraxinolia*, *Ixia*, *Babianas* in great variety, *Delphiniums*, a nice lot of *Persian Ranunculus* under name, flowers like those of many other plants, undersized on account of the drought; a pretty plant in *Ornithogalum pyramidalis*, having white flowers placed on long flower spikes; double-flowered Chinese Peony *Gloria Mundi*, white, with a faint bluish tint; P. *Madame Vilmorin*, rather finer, with a more decided pink tint, and a very numerous petals; P. *Mons. André*, white, with a purplish-rose tint. There were other fine varieties of Peonies, by their names apparently of French origin; and this portion of Messrs. BARR'S exhibit made a very creditable display. An Award of a Silver Flora Medal was made.

A good sized group came from Messrs. J. LAING & SONS, Stanstead Park Nurseries, Forest Hill, S.E., which consisted chiefly of inmates of the warm houses, and various double flowered tuberous rooted Begonias. Of foliage plants, there were remarked *Microstylis metallica*, *Abutilon Souvenir de Bonn*, white and green leaf; numerous varieties of *Croton*, of which *Alexander III.* was a desirable form, with broad entire leaf, having rich orange and yellow ground colouring, and a green marbling. Several *Draecenas* and the pretty *Burtonia Van Houttei* were remarked. The group was lightened by the presence of plants of *Mitonia vexillaria*, *Odontoglossum crispum*, *O. estrosum*, *Cattleya Mossie*, other Orchids, *Glorias*, &c. An award of a Silver Flora Medal was made.

An Award of Merit was made to Messrs. CUTBUSH & SON, Highgate Nurseries, N., for a small-flowered bedding *Begonia* of a bright scarlet colour, named *Phosphorescens*. It seemed to be a variety of the sempiternus type, particularly free to flower, and the flowers were thrown well up above the leaves in a tuft, not scattered and drooping, as in many varieties of *Begonia*. An Award of Merit was also made to *Heuchera micrantha*, from Messrs. CUTBUSH. This is a small-flowered species, colour white, produced on a large branching spike.

MESSRS. HUGH LOW & CO. of Bush Hill Park, Enfield and Clapton, London, exhibited a group of *Cannas* in bloom, differing in name from Messrs. CANNELL'S, but very like them in colouring, and dwarf habit. The finest were M. *Ritton*, bright fawn and salmon; *Francis Wood*, of a yellow shade; *Florence Vaughan*, rich yellow, spotted red; *Pierre Dupont*, brilliant red; *Souvenir de F. Guélain*, amber-yellow, red spots; *Ernest Renan*, terra-cotta and rose; *President Chandon*, golden yellow; *Lavin Rosels*, reddish-orange; *Alphonse Bouvier*, brilliant crimson; and L. E. *Balley*, canary-orange, spotted crimson (Silver Banksian Medal).

#### CARNATIONS.

The Carnation, being always with us, it is not to be wondered at that both the tree and the border types, in both cases brought into bloom under glass, were in evidence at this meeting. It was to be regretted that Mr. TURNER'S group of very fine varieties had to be placed in an out-of-the-way place, and where they were hidden from view during a good part of the afternoon.

Mr. TURNER had finely-grown pot-plants of *Ness*, a bright scarlet large-sized flower, as large as a *Malmaison*, very full and symmetrical, and fine in colour (Award of Merit); *Virgo*, a large yellow ground, of the character of *Mrs. R. Sydenham*, but gigantic in size, full, symmetrical, and pleasing (Award of Merit); *Delos*, also with large, full, *Malmaison*-like flowers of a pale dull scarlet (Award of Merit); *Miss Ellen Terry*, white; *Duchess*, a large pale rose-coloured variety, but a little rough; *Persimmon*, pale terra-cotta, of a pleasing shade, but the flowers lacked refinement; *Primrose League*, yellow ground, striped with bright reddish rose; *The Gift*, a very fine yellow ground, large, full and symmetrical; *Corinna*, a large yellow self; *Water Witch*, bluish, fine shell-like petals, &c. (Silver Flora Medal).

From Mr. NEVE, Hampton Court House, Hampton, came a white self Carnation, a good grower, well shaped petals; but as shown the flowers were with one or two exceptions thin and rough.

MESSRS. H. CANNELL & SONS, nurserymen, Swanley, had large bold bunches of a good sized rose coloured self, paling to delicate pink on the petal edges, and although to all appearance very free, too rough as shown for present day requirements.

From Mr. C. Blick, gr. to MARTIN SMITH, Esq., Hayes Common, Kent, came two very fine varieties, viz., *Nabob*, a bright buff self colour, the petal edges tinted with reddish-salmon, very fine in petal and bloom, an excellent grower and decidedly free; and *Her Grace*, the flowers opening with a bluish tint, changing to almost pure white when fully expanded, and which had all the high qualities of the preceding. In both cases an Award of Merit was made.

Mr. Williams, gr. to His Grace the Duke of MARLBOROUGH, Blenheim Palace, Woodstock, had a basket of plants of *Admiral*, a large deep yellow *Malmaison* type, full, of good shape, and an excellent grower, the plants to all appearance severely disabused (Award of Merit).

In marked contrast to this was a winter-flowering variety, shown by Messrs. W. BULCHIN & SON, Ilascocks Nursery, Sussex, and named *Mrs. Kate Bulchin*, ten plants of which were shown, having between them something like 100 expanded blossoms, of good petals and shape, sweetly-scented, a non-burster, the colour pale reddish-scarlet; a more free-blooming variety could scarcely be imagined, but as it had not been disabused, it stood but poor chance for recognition against the larger flowers now so much prized. It well deserved an Award of Merit.

A large and attractive group of *Malmaison* and other Carnations was staged by Messrs. W. CUTBUSH & SONS, The Nurseries, Highgate, N.; it consisted of a number of plants of light coloured *Malmaisons*, with patches of the yellow *Germania* in fine condition; *La Villette*, yellow ground, heavily flushed with pink, deepening to carmine; *Jersey Maid*, white; *Harrow Weald Beauty*, pink; *Cowslip*, pure white, the flowers having fine shell-shaped petals, very free, but with a tendency to droop in the flower-stems, the whole set off with *Palms* and *Ferns* in a very tasteful manner. Mr. Pentney, gr. to A. J. HOWARD, Esq., Worton Hall, Isleworth, also had a group of *Malmaison* and other Carnations, including *Uriah Pike*, in fine bloom; *Pride of Penshurst*, and others (Silver Banksian Medal). Lastly, Mr. G. Wythes, gr. to Earl Percy, Syon House, Brentford, had a group of white and rose coloured *Malmaisons*, in fine condition; and this, like the foregoing, was tastefully backed, fronted, and mingled with foliaged plants (Silver Banksian Medal).

#### Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (hon. sec.), Baron Schroder, T. B. Haywood, F. Courtland, W. Cobb, De B. Crawshaw, H. M. Pollett, J. Gabriel, T. W. Bond, W. H. White, H. J. Chapman, A. H. Snee, J. Douglas, E. Hill, and E. Mason.

There was a most extraordinary show of Orchids, which, though smaller, taken as a whole, surpassed the display made at the Temple Show.

Baron Sir H. SCHRODER, The Dell, Egham (gr., Mr. H. Ballantine), staged a neat group of beautiful species grown to perfection, especially noteworthy being *Laelio-Cattleya eximia*, with a grand four-flowered inflorescence of very rich colouring; two varieties of the handsome L.-C. *Canhamiana*, with massive flowers, the lip being a blending of rose, crimson, and purple tints; half-a-dozen noble varieties of *Odontoglossum crispum*, a *Mitonia vexillaria gigantea*, which was a mass of large bright rose-pink coloured flowers; and *M. v. radiata*, with handsome black-tinted blooms, the base of the lip having some effective rays of a claret colour; a fine specimen of *Laela majalis*, another of *Sobralia xantholena*, and the large *S. macrantha Kienastiana*, with snow-white flowers; *Cypripedium Stonei platycenium*, &c. The group was awarded a Silver Flora Medal.

Sir Trevor Lawrence, Bart., Burford, Dorking (gr., Mr. W. H. White), staged a charming group, in which were several brilliant-coloured *Masdevallia Harryana*, one of which, in a rather small pot, bore thirty flowers; the new rich purple and yellow M. *Rolfeana*; the pretty little M. *triumphista*, M. *simula*, and M. *guttulata*; M. *torta*, M. *Stella*, M. *Reichenbachiana*, and other *Masdevallias*; the pretty *Pleurothallis Groleylei*, *Saccolabium miniatum* (Botanical Certificate), and *Epidendrum fragrans* (Botanical Certificate), one of the earliest introduced of epiphytal Orchids; *Bulbophyllum Lobbiai*, a splendid variety of *Epidendrum prismatocarpum*, and the allied E. *Brassavola*; *Thunia Brymeriana* and the ure-white T. *candidissima*; *Dendrobium aduncum*, D. *bracteosum*, *Luisia Amesiana*, *Laelio-Cattleya x Arnoldiana*, L. *tenebrosa*, &c. (Silver Banksian Medal).

The Hon. Walter Rothschild, Tring Park, Tring, sent a splendidly flowered specimen of *Catasetum x splendens leucanthum*, with large creamy-white flowers, being of emerald-green in the spur and at the base of the sepals. In form and colour it most nearly approaches C. *Bungerothii*, like which, and C. *macrocarpum*, it is a natural hybrid. The present variety was charming, and secured an Award of Merit. Mr. ROTHSCHILD also showed fine examples of the yellow-flowered *Spathoglottis Lobbiai*, and S. *Kimballiana*, and a very singular little *Batemania* (?) from Costa Rica, a leafy, bulbless plant, with cream-white flowers, the curled reflexed sepals of which give the flower the appearance of having three spurs (Botanical Certificate).

MESSRS. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, were awarded a Silver Flora Medal for a splendid group, in the centre of which was a grand specimen of the best form of *Dendrobium thyrsiferum*, known as *Walkerianum*, surrounded by good forms of *Cattleya Mossie*, *Laela purpurata*, L. *tenebrosa*, and other *Cattleyas* and *Lelias*. On one side was a pair of the elegant *Disa x Langleyensis*, and on the other a similar one of *Disa x Kewensis*. Interspersed and effectively arranged were *Laelio-Cattleya x Hippolyta*, L.-C. *x Canhamiana*, the pretty pale-yellow L.-C. *Zephyra*, *Epidendrum aromaticum*, E. *vitellinum majus*, *Dendrobium Dearei* and other *Dendrobiums*, *Cypripedium x Clouinii*, C. *bellatulum*, C. *Curtisii*, *Odontoglossum*, *Cattleya citra*, &c.

Sir Frederick Wigan, Clare Lawn, East Sheen, showed the finest *Mitonia vexillaria* ever brought out in M. v. "Memoria G. D. Owen." The flowers were of the M. v. splendens class, but the mark at the base of the lip resembled the dark red expanded wings of a butterfly (First-class Certificate). Sir FREDERICK WIGAN also showed *Cattleya Mossie* "E. Ashworth," which may be described as a "Reineckiana" with a slate-coloured marbling on the front of the lip; and C. M. "Mrs. Egerton Grey," one of the largest and best of light-coloured *Mossies*.

H. T. Pitt, Esq., Rosslyn, Stoke Newington (gr., Mr. Aldous), was awarded a Silver Flora Medal for one of the best groups staged, and in which representatives of the showy things of the season were seen in excellent examples. The varieties of *Cattleya Mossie* were numerous and good, the best of all being C. M. *Pittiana*, a very large and well-formed flower, with a lip of a very beautiful rosy crimson colour, and crimped at the edges. Among other good subjects were some *Laela purpurata*, *Phaius x Owenianus*, *Celoglyne pandurata*, *Vanda Denisoniana*, *Angulata Clowesii*, *Oncidium phymatocilium*, *Odontoglossum*, *Cypripedium*, &c.

MESSRS. F. SANDER & CO., St. Albans, staged a large group, in which were *Batemania Wallisii*, *Phaius x Owenianus*, *Laelio-Cattleya x Arnoldiana*, *Sobralia x Ameske*, S. *x Veitchii*, *Dendrobium crystallinum*, D. *x suavissimum*, *Disa x Premier*, *Physochloa Loddigesii*, *Cirrhopetalum picturatum*, *Odontoglossum Harryana*, and other species of *Odontoglossum*; *Peristeria aspera* (Botanical Certificate), *Maxillaria nervosa*, *Pleurothallis tribuloides* (Botanical Certificate), *Aerides Houlettianum* and *Laelio-Cattleya x Mardelli* (C. *labata Lueddemanniana* (speciosissima) *x L. Mardelli*) a charming hybrid with much the same tints as L.-C. *x elegans* Turneri, and first raised by Messrs. Veitch, and flowered in 1879. It now received an Award of Merit, and the group a Silver Flora Medal.

WELLBORE S. ELLIS, Esq., Hazelebourne, Dorking (gr., Mr. Masterton), received a Silver Banksian Medal for a group of the favourite *Odontoglossum crispum* which he cultivates so well. The best were O. c. *Lord Sherborne*, a grand form of the O. c. *guttatum* class, fine in shape and clear in colour (Award of Merit), and O. c. *Mrs. Wellbore Ellis*, fine white bloom, with small purple blotches.

C. L. N. INGRAM, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), sent *Laelio-Cattleya x Pytho* (L. c. *elegans* Turneri *x* C. *Loddigesii*), a pretty hybrid, with much of the form and rose colour of L.-C. *elegans*, but with broad, light purple undulated front lobes to the lip (Award of Merit); L.-C. *x Regalis* (f. *purpurata* ♀, C. *Mendelii* ♂), and L.-C.

regalis nigra, both of which resembled forms of L.C. × Canhamiana, though the differences accountable to different parentage on the one side were evident; and L.C. × Electra (C. Percivaliana × L. purpurata), but leaning to C. Percivaliana, but with a more ample lip, and lighter in colour. All of these were small plants, and will doubtless greatly improve.

Messrs. HUGH LOW & Co., Clifton, secured a Silver Flora Medal for an excellent group, in which the varieties of Cattleya Mossiae were fine. Specially noteworthy were C. M. E. Ashworth, a C. M. Reineckiana, with lip marbled slate-blue; Cattleya intricata maculata, like C. amethystoglossa, with a C. intermedia lip; C. Mossiae Reineckiana, Lelio-Cattleya × Schilleriana, L. tenelrosa, Epidendrum Godseffianum, and other Epidendrums; Bulbophyllum Dearingi, Cypripedium Curtisii, and the pale green C. Curtisii viride, C. bellatulum, &c.

Messrs. B. S. WILLIAMS & SON, Victoria and Paradise Nurseries, Upper Holloway, N., had a nice group, in which the varieties of Vanda tricolor, Aerides odoratum, and other Orchids of the class which used to furnish the chief exhibition subjects, were well represented. With them were some good Odontoglossums, Cattleya labiata Warneri, Oncidium Marshallianum, the fragrant Vanda concolor, Anguloa Olowesii, Dendrobium polyphelebium, and other Dendrobiums, Cattleyas, Cypripediums, &c. (Silver Banksian Medal).

Messrs. W. L. LEWIS & Co. staged an effective group, in which Cypripedium × Gertrude Hollington superbum represented that magnificent hybrid at its best. Also in the group were a fine selection of Cattleya Mossiae, C. Mendeli, C. citrina, Oncidiums, Odontoglossums, &c.; also Cypripedium × Hobsoni (philippinense × callosum), and a remarkably pretty little Pogonia?, with one fleshy leaf, and erect spikes of pretty violet-lipped flowers, and green and brown marbling (Botanical Certificate, Bronze Banksian Medal).

ALFRED WARBURTON, Esq., Vine House, Haslingde, near Manchester, sent Lelia tenelrosa Victor Warburton, a very charming and distinct form, with the clear citron-yellow sepals and petals, as in L. f. Walton Grange var., but with a white lip delicately tinged, and lined in the centre with a peculiar reddish-rose colour.

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), sent Odontoglossum crispum Princess Mary of Teck, one of the best of large white O. crispums, and O. c. Miss Alice Adeline Gibson, also remarkably fine.

SIR CHAS. STRICKLAND, Bart., Hildonley, Malton, Yorkshire, (gr., Mr. W. Smith) showed flowers of his hybrid Cypripedium × (bellatulum × concolor Regnerii) very pretty and variable in marking; and a similar cross was sent by Mr. J. KEELING, Mount View Gardens, Glossop Road, Sheffield.

F. W. MOORE, Esq., Royal Botanic Gardens, Glasnevin, Dublin, sent Masdevallia fragrans.

T. W. SWINBURNE, Esq., Corndean Hall, Winchcombe, showed a fine selection of Cypripedium bellatulum, &c.

WALTER COBE, Esq., Dulcote, Tunbridge Wells (gr., Mr. J. Howe), showed Cattleya Mossiae Wagnerii, Cobb's var., a noble white form with rich orange centre to the lip and a slight trace of rose at its apex.

HOLBROOK GASKELL, Esq., Woolton Wood, Liverpool, sent Cypripedium × Ledouxii; and Capt. THOS. A. JULIAN, Plymouth, sent a fine Cattleya Mossiae.

Fruit and Vegetable Committee.

Present: Philip Crowley, Esq., chairman; and Messrs. Malcolm Dunn, Jos. Cheal, G. W. Cummins, A. F. Barron, A. H. Pearson, T. Francis Rivers, J. Wright, Alex. Dean, Jno. A. Laing, Geo. Wythes, F. Q. Lane, G. H. Sage, H. Balderson, Robt. Fife, and Robert Hoag.

H. M. THE QUEEN (gr., Mr. O. Thomas) exhibited a large collection of Strawberries, including many varieties that are now but little cultivated as well as some of the latest rais. d. The entire collection exhibited first class cultivation. The varieties were Auguste Niceise, Black Prince, Grove End Scarlet, Keen's Seedling, King of the Earlies, Laxton's No. 1, Stevens' Wonder, James Veitch, Empress of India, Competition, La Grosse Sucrée, Sharpless, President, Sir J. Paxton Scarlet Queen, Guntton Park, La France, Vicomtesse Hélicart du Thury, Jno. Ruskin, Royal Sovereign, Laxton's Leader, Laxton's Monarch, Sensation, and Laxton's Noble (Silver Banksian Medal). A white fleshed Melon, with yellow exterior and named Frogmore Orange, was also from Her Majesty's Garden. The fruit was of medium size, juicy, and of good flavour (Award of Merit).

Mr. James Hudson, gr. to the Messrs. DE ROTHSCHILD, Gurnersbury Park, exhibited four Nectarine trees in pots, of the varieties Early Rivers and Lord Napier. The trees were well fruited, carrying between them forty-three fruits of good quality. Some ripe Bigarreau Cherries were from the same garden; they had been grown on a south wall (Silver Banksian Medal).

Messrs. E. J. SARGENT & Co., Brougham Road, Worthing exhibited twelve excellent fruits of Hero of Lockinge Melon, and a number of fruits of a Melon Stierin de Tours (Vilmorin), a scarlet-fleshed variety, with uncommonly deep cork-like netting, one eighth of an inch deep. Several Capsicums were also shown, including Doux d'Espagne (Vilmorin), Tromp de Elephant (Vilmorin), both producing long red pods; and Jeanne d'Or (Vilmorin), a yellow-fruited variety (Silver Banksian Medal).

Mr. Geo. Wythes, gr. to the Earl Percy, Syon House, Brentford, showed a collection of vegetables from the open ground. This included Potatoes: Veitch's Ashleaf, Early May, Early Bird, Sutton's A1, and Sutton's Ringleader.

Peas: William I., Duke of York, Duke of Albany, and Carter's Springtide. Also some nice heads of Walcheren Cauliflowers.

Mr. WINGFIELD, Amptill House, Amptill (gr., Mr. Empson), exhibited a creditable collection of fruits and vegetables (Silver Banksian Medal). A First class Certificate was awarded to Melon Anthony's Favourite, from the same garden, a scarlet fleshed variety, which obtained an Award of Merit in October last. It has a scarlet flesh, and is the result of a cross between Hero of Lockinge and Sutton's Masterpiece.

A First-class Certificate was awarded to a new Melon shown by Mr. W. MESSENGER, Wolverstone Park, Ipswich. This was a white-fleshed variety, of good size, oval shape, and exquisite flavour.

Messrs. LANTON BROS., Bedford, exhibited a large number of plants bearing fruits of their new Strawberry Leader. Also dishes of fruits of the same, and other varieties (Vote of Thanks).

Mr. J. CORBETT, Musgrave Castle Gardens, near Whitby, exhibited some fine fruits of a Tomato Royal Sovereign, a solid fruit of the Perfection type, which was referred to Chiswick.

A collection of vegetables from the Royal Horticultural Society's gardens at Chiswick included Potatoes, Peas, Cauliflowers, Turnips, Mushrooms, Radishes, Carrots, Asparagus, Lettuces, Beet, Onions, &c., and a dish of fine fruits of Guntton Park Strawberries. Some capital heads of Colchester Asparagus from beds twenty-five years old were exhibited by Mr. FRANK CHAPMAN.

Lecture by Professor Henslow.

In the afternoon a lecture upon the "Movements of Plants" was delivered by the Rev. Professor HENSLAW, and the subject was fully illustrated by means of a lantern. Commencing with the movements sometimes made by seeds, when the radicle emerges therefrom to strike straight down into the soil, Professor HENSLAW described many of the changes of position of which particular roots are capable. The next class of such phenomena explained was those peculiar to the stem, afterwards the habits of climbing plants, and the movements necessary to their existence as such were remarked upon. Reference to the motions observed in flowers and in fruits brought the interesting proceedings to a close.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS. Above 42° or below 42° the Mean for the week ending June 6.	TEMPERATURE.				RAINFALL. No. of Rainy Days since Dec. 29, 1895. Total Fall since Jan. 1, 1896.	BRIGHT SUN. Percentage of possible duration for the week. Percentage of possible duration since Dec. 29, 1895.

The districts indicated by number in the first column are the following:—  
0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; \*Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending June 6, is furnished from the Meteorological Office:—

"The weather continued fine and dry generally during the earlier days of the period, but subsequently became very changeable in all districts, with steady rain and some thunder in Scotland, and heavy showers, with occasional thunderstorms, in all other parts of the kingdom.

"The temperature was again above the mean in Ireland, England, and the west of Scotland, but only just equalled the normal in 'Scotland, E.,' and was a little below it in 'Scotland, N.' The highest of the maxima, which were recorded on May 31 in Scotland, on June 2 over England, and on irregular dates in Ireland, ranged from 85° in 'England, S.,' 84° in 'England, E.,' and 81° in the 'Midland Counties,' to 71° in 'Scotland, W.,' and to 61° in 'Scotland, N.' The lowest of the minima occurred during the early part of the week, and varied from 33° in 'England, E.,' 37° in 'Scotland, E. and W.,' and 35° in 'Ireland, N.,' to 42° in 'England, N.W.,' and to 5° in the 'Channel Islands.'

"The rainfall was a little less than the normal in 'England, S. and E.,' but exceeded it in all other districts. The fall over England was rather irregularly distributed, but the largest amounts occurred, as a rule, over the northern counties.

"The bright sunshine was less than the normal in Scotland, but exceeded it in nearly all the English and Irish districts. The percentage of the possible duration ranged from 64 in 'England, S.,' 61 in 'England, E.,' and 55 in the 'Channel Islands,' to 25 in 'Scotland, E.,' and 14 in 'Scotland, N.'"

NEW CARNATIONS.—The new Malmaison Carnations raised by MARTIN R. SMITH, Esq., in his garden at Hayes, Kent, comprising Lady Grimston, Trumpeter, Prime Minister, Lord Rosebery, and the pure white Nell Gwynne, have passed into the hands of Mr. J. DOUGLAS, of Great Bookham, and will probably be distributed in the autumn of the present year.

MARKETS.

COVENT GARDEN, JUNE 11.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. En.]

ORCHID-BLOOM in variety.

SEEDS.

LONDON: June 10. — Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that the recent most welcome rains have naturally caused a slightly increased sowing demand, more particularly for Spring Tares and Swedish seed. For Clover, and especially Profail seeds, there is still a good speculative inquiry, the latter article has, indeed, during the last fortnight, advanced several billings per cwt. Mustard and Rape seed show no change. New Turkish Canary seed, to arrive, is quoted to-day cheaper than ever before known Hemp seed is also dull. The market for Peas and Haricots is steady. The Board of Trade Returns give the imports of Clover and Grass seeds into the United Kingdom for the first five months of this year as cwts. 237,230, value £457,664, as against cwts. 223,838, value £524,637 for the corresponding period of last year.

FRUIT AND VEGETABLES.

BOROUGH: June 9.—Quotations:—Onions, 6s. to 7s. per cwt.; Spring do., 1s. to 1s. 6d. per doz. bunches; Horse-radish, 1s. 9d. to 2s. 3d. per bundle; Cabbages 1s. 6d. to 1s. 8d. per tally.

SPITALFIELDS: June 9.—Quotations:—Cabbages, 2s. to 3s. per tally; bunch Greens, 1s. 3d. to 1s. 6d. per dozen; Spring Onions, 1s. 6d. to 2s. per dozen bunches; Lettuce, 9d. to 1s. per score; Peas, 2s. to 3s. per bushel (whites); do., Longpods, 4s. to 6s. do.; do., Blues, 3s. to 4s. do.; Mint, 2s. to 2s. 6d. per dozen; Parsley, 1s. to 1s. 6d. doz. bunches; Leeks, 1s. to 1s. 6d. do.; Asparagus, 6s. to 12s. per dozen bundles; Rhubarb, 1s. 6d. to 2s. do.; Cucumbers, 2s. to 3s. per dozen; Spinach, 9d. to 1s. per bushel; Beets, 1s. 6d. to 2s. do.

STRATFORD: June 9.—Quotations:—Trade has been rather better for all classes of produce. Demand has been brisker. Mangels are in demand. Cabbages, 1s. to 3s. per tally; Greens, 1s. to 2s. per dozen bunches; Cauliflowers, 1s. to 2s. per dozen; Beetroot, 6d. to 8d. per dozen; Horse-radish, 2s. to 2s. 6d. per bundle; Parsley, 1s. to 1s. 6d. per dozen; Rhubarb, field, 2s. to 2s. 3d. per dozen bunches; Leeks, 1s. 6d. to 2s. do.; Spring Onions, 1s. to 1s. 6d. do.; Salad, 1s. 6d. to 2s. per dozen punnets; frame Cucumbers, 1s. 6d. to 3s. 3d. per dozen; Asparagus, 6d. to 1s. 3d. per 100 heads; Green Peas, 2s. 6d. to 2s. 9d. per bushel; do., 4s. to 5s. 6d. per bag; Tomatos, 5 1/2d. to 6d. per pound; Turnips, 1s. 9d. to 2s. per dozen bunches; Carrots, bunches, 4s. to 6s. do.; Mangels, 10s. to 12s. per ton; Peas, 25s. per quarter; Onions, Egyptian, 90s. to 100s. per ton.

FARRINGTON: June 11.—Quotations:—Cabbages, 3s. per tally; Turnips, 2s. 6d. per dozen bunches; Carrots, 4s. do. (new and old); Leeks, 2s. per dozen; Spring Onions, 2s. per dozen bunches; Horse-radish, 1s. 6d. to 2s. per bundle; Lettuce, 1s. 6d. per score (good); Parsley, 2s. per dozen bunches; Broad Beans, 4s. per bushel; Asparagus, 1s. per bundle; Endive, 2s. per dozen; Cucumbers, 2s. to 3s. 6d. per dozen; Gooseberries, 4s. per bushel; Cherries, 9s. per half-bushel; Tomatos, English, 8s. per dozen pounds; Jersey, do., 6s. do.; Mushrooms, 8s. do.; Strawberries, 2s. to 2s. 6d. per basket of six pounds; French do., 6s. per dozen pounds; Apples, 10s. to 12s. per case.

POTATOS.

BOROUGH: June 9.—Quotations:—Old ranged from 36s. to 90s. per ton; New, 5s. to 11s. per cwt.

SPITALFIELDS: June 9.—Quotations:—New: Jersey Flukes, 9s. 6d. to 10s. 6d.; Kidneys, 9s. to 10s.; St. Malo Kidneys, 8s. 6d. to 9s.; Flukes, 9s. to 10s. per cwt. Old: Highland Bruce, 30s. to 50s.; Blacklands, 27s. to 30s. per ton.

STRATFORD: June 9.—Quotations:—New: Jersey Kidneys, 9s. to 10s.; do. Flukes, 9s. 6d. to 10s. 6d.; Cherbourg, 8s. to 8s. 6d.; St. Malo Flukes, 8s. 6d. to 9s. 6d.; Lisbon, 5s. to 6s.; Canary, 4s. to 10s. per cwt. Old: Dark soil Bruces, 15s. to 20s.; light do., 15s. to 30s.; Reading Giants, 15s. to 40s.; Magnums, 15s. to 40s. per ton.

FARRINGTON: June 11.—Quotations:—Old, 20s. to 30s. per ton. New: Jersey Flukes, 10s. to 11s.; do Kidneys, 8s. to 9s. 6d. per cwt.

LONDON MARKET AVERAGES: June 10.—Quotations:—New: Jersey, 9s. to 10s.; Guersey, 8s. to 9s.; Cherbourg, 7s. to 8s.; St. Malo, 8s. to 9s.; Lisbon, 5s. to 6s. per cwt. Old: Dunbar Main Crop, 50s. to 70s.; do. Bruce, 50s. to 60s.; Imperators, 30s. to 40s.; Magnums, 20s. to 30s. per ton.

ENQUIRIES.

"He that questioneth much shall learn much."—Bacon.

NEPHELIUM LIT CHI.—A correspondent from Belgum asks where plants of the Lee Che can be obtained in quantities to stock a plantation in the Argentine Republic.

PICEA (OR ABIES) ALBA.—Will some lover of Conifers kindly send by post a spray with cones of this species to "S," care of the editor of this journal. What is generally grown in this country as Abies alba seems really to be A. nigra.

NOTICES TO CORRESPONDENTS.

ANNUALS FOR THE SPRING GARDEN: May. We can only give you the names of a few. Alyssum maritimum, sow in middle of August; Bartonina aurea, at the same time; Calandrinia speciosa and C. umbellata, sow at end of August; Collinsia in variety, beginning and middle of August; Escholtzia, beginning of July; Gypsophila elegans, middle of August; Limnanthes Douglasii, end of August and later; Myosotis in variety, middle of June; Neomphala, end of August; Saponaria calabrica and S. c. alba, middle of August; Silene pendula, end of July; Virginian Stock, end of August; Clarkias in variety, if sown in pots in September, and wintered hardily in cold frames, thinned out to three plants in a pot, and shifted on into 32's in February, make splendid beds if planted out in early April. They are worth all the trouble of this kind of culture. The time of sowing above given may, in the case of the warmer counties, be a fortnight later.

BLOOD MANURE: W. B. S. N. The high-dried blood-manure of commerce contains only 3 to 4 per cent. of nitrogen, and 15 per cent. of ammonia. Partially dried blood contains from 6 to 7 per cent. of ammonia. We cannot tell you, as an amateur, how you can manage the drying.

BOOKS: M. C. We do not know of any book in our language which describes the methods and practices of bouquetistes. These have to be learnt in the usual manner in a florist's shop.—NICHOLSON'S DICTIONARY: H. B. No book could contain all the plants cultivated in gardens. Next week we will endeavour to relieve some of your perplexities.

CARNATIONS DYING OFF: E. L. Stafford. The plant sent is affected with eel worms (Tylenchus), as are doubtless all of the other plants in bad condition. The worms exist in the tissues of the leaves and collar of the plant, where no remedial means can reach them which would not kill the plant. Burn every affected plant, and cultivate your Carnations another year on a piece of land at some distance from the bed of this year. See *Gardener's Chronicle*, December 3, 1881, p. 721, for article and figure.

CERASTIUM TOMENTOSUM: G. B. Slips put in, in a shady place in August, soon make roots.

CUCUMBER SHOOTS UNHEALTHY: A. B. Due probably to errors in cultivation. Keep a night temperature of 65°, and one by day of 85° maximum; supply the roots with plenty of water. Stop the shoots regularly and thin them out rather severely at short intervals of time.

ERGOT: *Phyllostachys*. Not Ergot. We will examine and report.

FERN: A. R. We detect nothing on the fronds except the sori of the fructification. These have apparently been mistaken for parasites.

GREEN BRICK FLOOR: J. B. Scalding water in which plenty of washing soda is dissolved; white vitriol, and weed-killer may be tried for ridding the bricks of the path of the greenness that over-spreads them.

HEUCHERA: L. C. The plant of Heuchera looks in a sorry condition, but we can find no disease which we can name. There is no fungus growth in the tissues, and no affection of the roots. In fact, from the plant itself we can see no efficient cause, and think it must be something in the surroundings which causes the mischief. M. C. C.

HYGROMETER: *Margarct*. The difference between the readings of the two thermometers will be greatest when the air is driest, and zero when it is completely saturated with moisture. The height of the mercury in each of the thermometers being found, the elastic force of vapour at the dew point is calculated by Dr. Apjohn's Formula (Proceedings of Royal Irish Academy, 1840):—

$$(1) F = f - \frac{d}{88} \cdot \frac{h}{30}$$

$$(2) F = f - \frac{d}{96} \cdot \frac{h}{30}$$

The first formula to be used when the wet thermometer is above, and the second when it is below, the freezing-point. *F*, is the elastic force of vapour at the dew point; *d*, the hygrometric depression or depression of the dew point; *h*, the height of the barometer. After *F* has been determined, the quantity of moisture in a cubic foot of air can be found according to the following formula—weight

of moisture in grains =  $\frac{5656 \cdot 2}{448 \times t} \times p$  where *t* is the temperature of the air at the time of observation, *p* is found from tables.

MELON DISEASED: G. H. Badly affected with eel-worms, often described and figured in these columns. Burn the plants, and get fresh soil.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—R. C. W. Thunia alba.—F. Y. 1, *Cratogeomys pyræantha*; 2, *Jasminum fruticosum*—*Ambrosia*. *Asphodelus luteus*.—Mrs. H. *Cynoglossum officinale*.—V. C. 1, *Listera ovata*; 2, *Lotus corniculatus*; 3, *Veronica Chamædrys*; 4, *Anthriscus vulgaris*; 5, *Tanacetum vulgare*; 6, *Sium latifolium*; 7, *Geranium pratense*.—J. W. 1, *Campanula persicifolia* var.; 2, *Agrostema coronaria*; 3, *Stenactis speciosa*; 4, perhaps a *Rudbeckia*; 5, *Campanula glomerata*; 6, *Pyrethrum uliginosum*.—W. C. 1, *Poa pratensis*; 2, *Holcus lanatus*; 3, *Avena flavescens*; 4, *Lolium perenne*; 5, *Bromus mollis*; 6, *Dactylis glomerata*; 7, *Alopecurus agrestis*.—H. E. D. 1, The Common Snowberry. *Symphoricarpos racemosus*; 2, *Symphytum tuberosum*; 3, *Lychnis diurna*; 4, *Hypericum calycinum*; 5, not recognised; 6, *Corydalis lutea*. Very likely we made a mistake—we do not pretend to infallibility.—W. H. M. Quite withered when received. It looks like *Exochorda* (or *Spiraea grandiflora*).—D. P. *Silene noctiflora*.—E. C. C. D. *Lonicera japonica*.—J. B. *Cypripedium Godefroye leucocolum*.—W. S. T. 1, *Cornus sanguinea*, Wild Dog-wood; 2, *Acer eriocarpon*; 3, A. *Ginnala*.—H. H. H. *Muscari comosum*.—W. T. 1, *Cratogeomys coccinea*; 2, *Verbascum phonicum*.—W. S. L. *Lonicera* next week.—A. J. S. *Schizanthus pinnatus*.—W. T. J. 1, *Rhododendron blandfordiaeflorum*; 2, *Zenobia speciosa*; 3, *Empiphoria cyparissias*; 4, *Raphiophylla ovata*; 5, *Indigofera decora*; 6, *Azara microphylla*.—F. E. 1, *Lychnis viscaria*, double-fl.; 2, *Veronica gentianoides*; 3, *Lupinus polyphyllus*; 4, *Genista tinctoria*; 5, *Xeranthemum*; 6, *Spiraea bullata*.—J. L. C. *Campanula glomerata*.—D. T. F. 1 and 2, *Pinus*, not recognised; please send better specimen; 3, *Abies bracteata*; 4, *Cupressus obtusa* var. *filicoides*; 5, *Torreya Myristica*; 6, *Sequoia sempervirens*; 7, *Juniper virginiana*; 8, *Picea nigra* (probably); 9, *Sequoia sempervirens*; 10, *Abies grandis*; 11, *A. pungens glauca*.—H. B. *Gomezia planifolia* is correct, and not a misprint. Nicholson's Dictionary does not contain all garden-plants. How could any book do so?

PANSIES: F. W., *Dover*. The climatic conditions in Sheffield are doubtless unfavourable to Pansy culture. If you have not grown them in pots under glass for early blooming, you should do so. Kindly send a specimen of a "dwindling" plant for our inspection.

PEACH BLISTER: C. L. Very common; the result of a fungus often figured and described in these

columns. Spraying early in the season with weak Bordeaux Mixture would keep it in check. Burn the affected leaves so far as you can.

**PINKS OF ALL KINDS: Amateur.** Take pipings forthwith, selecting strong wiry grass, cutting them transversely through, just below a joint where the growth has obtained a certain degree of hardness. Never let the cuttings flag, but before making and when made keep them immersed in a vessel of water. In a small way the cuttings can be struck in boxes of 6 inches in depth, furnished with a few holes in the bottom to prevent the water stagnating, but not so numerous as to cause rapid drying of the soil, for Pink cuttings once watered should not receive any more water till rooted. Place some coarse gravel, crocks, &c., at the bottom, then 3 inches of sandy soil, water it heavily, and whilst in a state of mud stick in the cuttings, and as deep as the lower leaves. Cover with a piece of glass, and keep close, putting the box on the north or shady side of a wall. Take off the glass for fifteen minutes once in three or four days to dissipate excess of moisture, and in three weeks every cutting almost will have made roots. The glass is then no longer wanted, and the box should be placed in the sun; and in August the Pinks may be planted in beds or patches of five or six plants, which is the better way for planting in mixed borders, single plants making no show till the second year. Carnations may be similarly increased, but the percentage of losses will be considerable.

**SACHALIN: Succaline.** Your plant is *Alyssum maritimum*. Sachalin is an island north of Yezo belonging to Russia.

**SMALL GRAPE BERRIES: A Constant Reader.** The result of imperfect setting, which might have been averted by your using pollen of other varieties.

**STRAWBERRIES: Strawberry.** There must be something the matter with the variety *Héricart du Thury*, which does badly, whilst others do well—eel worm, weevil grub, or fungus. Kindly send a plant or two of the variety for examination. Yes, the plant requires potash.

**TOMATO MOULD: Anxious One** has sent us specimens of a very bad condition of this pest, which is extremely common this year. It is caused by *Cladosporium fulvum*, which was first described in this journal, October 20, 1887, and has continued since to increase and spread. We have been assured by one or two cultivators on a large scale, that it may be kept in check by limiting the supply of water, lowering the temperature, and admitting fresh air. One tells us that he has never suffered since he adopted this method. It is as common in the United States as with us, and it is recommended there to keep the temperature as nearly even as possible. It is stated that "the fungus is more likely to attack plants under glass which have been subjected to sudden changes of temperature, such as may be caused in winter by the fires becoming low or too much ventilation during cold, and especially windy weather." Even there, where fungicides are freely applied, we learn that spraying is of no service after the fungus has made its appearance. It has been proved that healthy plants may be inoculated with the spores from diseased individuals. — A. C. The old trouble; the plants infested with the common Tomato mould, *Cladosporium fulvum*. Gone too far for remedy. Try an equable lower temperature, and more ventilation. M. C. C.

**TOMATOS AND A DRY ATMOSPHERE: J. B.** Most of the fungous diseases of Tomatos are set up by heat and moisture combined, and your experiment in stopping the spread of the disease by keeping up a high temperature with dryness, is of much interest to cultivators. We will publish your note in our next issue.

**VINE AND TOMATO LEAVES: Derby.** The spots on Tomato leaves are the common brown mould, *Cladosporium fulvum*—which depends very much upon temperature and ventilation. The discoloured spots on the Vine leaves are no evidence of disease. It is difficult to affirm what caused them, but probably some surroundings which may be corrected. Otherwise the leaves are healthy and vigorous enough. M. C. C.

# SHANKS'S LAWN MOWERS.

FITTED with PATENT AXLE SPRINGS.  
A GREAT BOON TO GARDENERS AND ALL USERS.  
The Best Work Combined with Ease in Working.  
NO SHAKING, EVEN on ROUGH GROUND.

**MOWERS with Springs, for Horse, Pony, and Donkey Use.**  
**HAND MACHINES, driven by Chain or Gear, and Fitted with Springs.**

LORD'S CRICKET GROUND, LONDON, June 15, 1894.  
I have used your Lawn Mowers for over twenty years, and have no fault to find with them. I consider them the best in the market, and they are the only Machines we use here. The addition of the springs to our 48-in. Mower is a great improvement, and the machine works with great ease and smoothness. I consider you have made a good hit.—Yours truly, (Signed) PERCY PEARCE, Ground Superintendent.

AND SIXPENCE FOR EVERY ADDITIONAL LINE.

If set across two Columns, the lowest charge will be 20s. If set across three Columns the lowest charge will be 30s. Page, 2s; Half Page, 2s 10s.; Column, 4s.

**GARDENERS AND OTHERS WANTING SITUATIONS.** 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

**POSITION.**—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

**NOTICE TO ADVERTISERS.**—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. G. COVE, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

### SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. G. COVE.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

### ILLUSTRATED CATALOGUE FREE.

The Pioneer of cheap, simple, and effective heating for small Greenhouses.

### REDUCTION IN PRICES.

Owing to improved facilities for the manufacture of these Boilers, and a consequent cheapening in the cost of production, we are enabled to reduce the prices as follows:— No. 1, £2 12s.; No. 2, £3 15s.; No. 3, £5; also larger sizes. Complete Apparatus from £4 8s. Lists and Estimates on application.

**MESSENGER & CO.,** Loughborough, Leicestershire. London Office: 99A, VICTORIA STREET, WESTMINSTER, S.W.

## GREENHOUSES, CUCUMBER-FRAMES, SASHES, GARDEN-LIGHTS,

And all kinds of HORTICULTURAL WOOD-WORK and SUNDRIES. Also WREATH, CROSS, and FLOWER-BOXES of every description. Special Line in GARDEN-HOSE. Portable and other POULTRY-HOUSES. Write for Prices to—

**EDWARD TAILBY,** ALEXANDRIA SAWING, PLANING, AND MOULDING MILLS, SUMMER ROW, BIRMINGHAM.

## LETHORION (Vapour Cone) PATENT.

The total destruction of Insect Pests in Greenhouses is thoroughly secured without the slightest possible injury to Flowers or Plants of the tenderest kind. It CANNOT fail where the houses are secure. Red Spider, Scale, and Mealy Bug can be easily eradicated by doubling the Cone power.

PRICES: For frames, &c., of 50 to 100 ft., 6d.; 500 to 700 ft., 9d.; 1000 to 1500 ft., 1s.; 4000 ft., 3s. 6d.

The public are cautioned against imitations in various forms at less cost, as they have in most instances proved to be worthless articles, totally unequal to Lethorion in strength and effect.

# GREEN'S PATENT "SILENS MESSOR" AND "NEW MONARCH" ROLLING AND COLLECTING MACHINES FOR 1896.

The Winners of every Highest Prize in all cases of competition, and the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by— They are the first, foremost, and best in the world.  
**HER MOST GRACIOUS MAJESTY THE QUEEN** on numerous occasions,  
**HIS ROYAL HIGHNESS THE PRINCE OF WALES,**  
**THE KING OF THE BELGIANS.**  
**The Late EMPEROR OF THE FRENCH.** **The EMPEROR OF RUSSIA,**  
 And most of the **NOBILITY, CLERGY, and GENTRY** of the United Kingdom.

The Horse Lawn Mowers having been in use here for upwards of thirty years; but combined with good workmanship is the further important recommendation that they are of very light and easy draught. And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.

Upwards of 220,000 of these Machines have been sold since they were first introduced in the year 1856. They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

## SINGLE-HANDED SILENS MESSOR LAWN MOWER, With Improved Steel Chains, Wheels, and Handles.

To cut 6 in., can be worked by a Lady	... £1 15 0
To cut 8 in., do.	... 2 10 0
To cut 10 in., do. by a strong youth	... 3 10 0
To cut 12 in., do. by a man	... 4 10 0
To cut 14 in., do.	... 5 10 0

We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.

BEWARE OF DECEPTIVE IMITATIONS.

## DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, can be worked by one man on even lawn	... £8 10 0	To cut 22 inches, can be worked by two men	... £8 10 0
To cut 18 inches, do. man and boy	... 7 10 0	To cut 24 inches, do.	... 9 0 0
To cut 20 inches, do.	... 8 0 0		

These Mowers are the "Ne Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.

Donkey, Pony, and Horse Machines, including Patent Self-Delivery Box, or Side Delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Oig Harness. We have dispensed with the old-fashioned method of side delivery in these machines, so that they are thoroughly up to date.

## DONKEY AND PONY MACHINES.

To cut 26 inches	... £14 0 0
To cut 28 inches	... 16 0 0
To cut 30 inches	... 18 0 0
Leather Boots for Donkey	... 1 0 0
Leather Boots for Pony	... 1 4 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

## HORSE MACHINES.

To cut 30 inches	... £23 0 0
To cut 36 inches	... 28 0 0
To cut 42 inches	... 30 0 0
To cut 48 inches	... 34 0 0
Leather Boots for Horse	... 1 9 0

## GREEN'S PATENT LAWN TENNIS COURT MARKER (No. 2412).

The Best Marker made.

1st size, with 3 wheels, 14s.  
 Large size for Clubs and Large Grounds, price 17s.

Small Bag of Marking Composition, 9d.

## Green's Patent New Monarch LIGHT DRAUGHT LAWN MOWER.

It is superior to any Mower of this class yet brought out. Very suitable for Small Lawns and Banks.

### SIZES AND PRICES.

To Cut	6	8	10	12	14	16 inches.
Without Grass Box	30s.	35s.	40s.	50s.	60s.	70s. each.
Grass Box extra	5s.	5s.	5s.	6s. 6d.	6s. 6d.	6s. 6d., &c., 5s. extra.

No charge for packing-cases, except for shipment.

Carriage paid to all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

The largest stock of Mowers kept by any manufacturer is to be found at our London Establishment, SURREY WORKS, BLACKFRIARS ROAD, where Purchasers can make selection out of several hundred Machines of Hand, Pony, and Horse Power, and have their Orders supplied the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, Free of Cost to the Purchaser.

N.B.—Those who have Lawn Mowers which need repairing should send them either through their Ironmonger or Seedsman to our Leeds or London Establishment, or direct to us, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

GARDEN SEATS AND CHAIRS, AND HORTICULTURAL IMPLEMENTS OF EVERY DESCRIPTION, WIRE NETTING, &c., &c. Descriptive Illustrated PRICE LISTS Free on application to

**THOMAS GREEN & SON, LIMITED, SMITHFIELD IRONWORKS, LEEDS; AND SURREY WORKS, BLACKFRIARS ROAD, LONDON;** or they can also be had of any respectable Ironmonger, Seedsman, Merchant, or Factor in the United Kingdom.

## GREEN'S PATENT Ordinary IRON and WATER-BALLAST ROLLERS

FOR Lawns, Drives, Bowling Greens, Cricket Fields, and Gravel Paths.

PRICES OF	cwt. qr. lb.	Diam.	Length.	Reduced Prices
HAND ROLLERS.	2 1 0	16 in.	by 17 in.	£2 5 0
	3 0 0	20 in.	22 in.	3 0 0
	5 2 0	24 in.	26 in.	4 5 0
	8 2 0	28 in.	30 in.	5 10 0
	8 2 0	30 in.	32 in.	7 5 0

## GREEN'S IMPROVED WATER & SAND BALLAST ROLLERS.

IN TWO PARTS.

They can have the weight regulated to suit the requirements of the ground, and also have it increased up to 45% on the empty weight of the Rollers.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in Great Britain.

PRICES, INCLUDING WATER FUNNEL.	cwt. qr. lb.	Diam.	Length.	Reduced Prices
ING WATER FUNNEL.	2 1 14	18 in.	by 17 in.	£3 0 0
	3 1 0	20 in.	22 in.	4 0 0
	5 2 0	24 in.	26 in.	5 5 0
	6 2 0	28 in.	30 in.	7 0 0
	8 2 0	32 in.	33 in.	9 5 0

These Rollers possess many advantages over all others; they are made in two parts, and are free in revolving on the axis, which affords greater facility for turning, and the outer edges are rounded off or turned inwards, so that the unsightly mark left by other Rollers is avoided. They are manufactured of the best materials, bored true in the lathe, turned on the inner edges, fitted on polished shaft, and are got up in a manner surpassing any hitherto brought out.

## GREEN'S IMPROVED PATENT GRASS EDGE CLIPPER. THE "HANDY."

The work it does is clean, neat, and effective, and we have every confidence in recommending this useful "Handy" implement.

It is fitted with long handle, works steadily and with ease.

Price, 30s.

## SALES BY AUCTION.

Thursday Next, June 25.

GRAND IMPORTATION OF PERISTERA ELATA (?),  
C. MOSSLE, ETC.

**MR. J. C. STEVENS** will **SELL** by **AUCTION**, at his Great Rooms, 38, King Street, Covent Garden, W.C., on **THURSDAY NEXT**, June 25, at half-past 12 o'clock precisely, by order of Messrs. Lewis & Co., Southgate, an **IMPORTATION OF ORCHIDS**, comprising *L. Præstans* (true), *L. anceps* Barkeri, *C. Warneri*, *C. Harrisonæ*, *viola*, *Odontoglossum Londeseboroughianum*, *O. madrense*, *O. Forbesii*, *O. sacrodes*, *C. niveum* in flower, fine variety. Also an importation of **EAST INDIAN** and **MEXICAN ORCHIDS**, by order of Mr. J. W. Moore, of Eldon Place Nursery, Bradford, a small collection of rare, curious, and remarkable ORCHIDS, an importation of *C. LINDERMANNIANA* and *C. MOSSLE*, among which the white variety may be expected. Also a grand importation of **PERISTERA ELATA**? from Columbia in magnificent condition, without reserve. Also **STOVE** and **GREENHOUSE PLANTS**, **PALM SEEDS**, &c. On view morning of Sale, and Catalogues had.

Friday Next, June 26.

By order of Mr. P. McARTHUR.

A grand importation of **UROPEDIUM LINDENI**, in splendid condition; this distinctly beautiful plant is extremely rare. Together with—

**CATTLEYA MOSSLE SPLENDENS.**  
**ANGULIA CLOWESII.**  
**ODONTOGLOSSUM STELLMICANS.**  
**ONCIDIUM PAFILIO MAJUS.**

And a Complete Edition of Messrs. F. Sander & Co.'s *Reichenbachia*, unbound, in good condition. (Another property.)

Also, by order of Messrs. W. L. Lewis & Co., Southgate, **IMPORTED ORCHIDS**, comprising *Laelia anceps* Barkeriana, *L. Dayana*, *L. peduncularis*, *Cattleya crispata*, *C. Harrisonæ*, *viola*, *O. Warneri*, *Odontoglossum Londeseboroughianum*, *O. madrense*, &c. An importation in fine order of a probably **NEW CATTLEYA**, a dwarf form with crimson buds and leaves, most distinct; *O. VELATINA*, *LAELIA PRÆSTANS* (true), &c.

**MESSRS. PROTHEROE AND MORRIS** will **SELL** the above by **AUCTION**, at their Central Sale Rooms, 87 and 88, Cheapside, London, E.C., on **FRIDAY NEXT**, June 26, at half-past 12 o'clock.

On view morning of Sale, and Catalogues had.

Friday Next, June 26.

**CATTLEYA MENDELI.**

In fine condition and with good dormant and starting eyes, of which the sender says:—"They are of a grand type and come from a new district where hardly ever plants have been collected before. The flowers which I saw were very fine, mostly with pure white sepals and petals, the broad lip rich purple-crimson. My collector tells me that he saw two or three plants with wholly pure white flowers. Unfortunately he has not marked them, and I would not allow him to attempt to select them, so all must go together."

These are, in spite of the long and difficult journey which admitted of only a small lot being brought, in capital condition, and every piece which came is included in the sale.

**MESSRS. PROTHEROE AND MORRIS** will include the above in their **ORCHID SALE** on **FRIDAY NEXT**, June 26.

On view morning of Sale, and Catalogues had.

Harefield Grove, Rickmansworth, Herts.

About 2 miles from the town, with Stations on the L. & N. W. and Metropolitan Railways, and 6 miles from Watford, with Station on the L. & N. W. Railway.

IMPORTANT SALE OF VALUABLE GREENHOUSE PLANTS, &amp;c.

**MESSRS. SEDGWICK, SON AND WEALL** will **SELL** by **AUCTION**, upon the Premises, on **MONDAY**, June 29, 1896, at 11 o'clock precisely, the whole of the valuable **GREENHOUSE PLANTS**, consisting of many finely-grown **PALMS**, including *Chamerops*, *Kentia*, *Latania*, *Phoenix*, *Scaevola*, &c.; **ORCHIDS**, comprising *Cologlyne*, *Cattleya*, *Dendrobium*, *Lælia*, *Odontoglossum*, &c. About 200 *Calla æthiopica*, 175 *Eucharis amazonica*, 400 *Amryllis* (various), *Maidenhair* and other Ferns, and numerous other plants, being the contents of about twenty houses, about 24,000 flower-pots, the furniture in both, garden tools, and numerous outdoor effects.

Catalogues may be had at the usual hotels and inns in the neighbourhood; of Messrs. **CHATTERS, NICHOLS, AND CO.**, 1, Queen Victoria Street, E.C.; and of Messrs. **SEDGWICK, SON, AND WEALL**, Land and Timber Surveyors, Estate Agents and Auctioneers, 38, High Street, Watford, Herts.

Longfield Lane, Cheshunt, Herts.

By order of the owners.

TO NURSERYMEN AND GROWERS.

**MESSRS. CRAWTER** are instructed to **SELL** by **AUCTION**, at the Four Swans Hotel, Waltham Cross, on **THURSDAY**, July 2, 1896, at 6 for 7 o'clock precisely, a **VALUABLE FREEHOLD NURSERY**, situated in Longfield Lane, Cheshunt, comprising about 6 acres of Land, a well-built House with eight large and lofty rooms, and about 1,200 feet run of Glasshouses, all in thorough repair, and heated by rows of hot-water pipes.

The Nursery, which is situated about 2 miles from Cheshunt Railway Station, has been worked by the owners themselves for several years past, thus offering an opportunity to an enterprising man of securing a first-class property in working order.

May be viewed at any time, and particulars and conditions of sale obtained of A. C. LEE, Esq., Solicitor, Waltham Abbey and Cheshunt; Messrs. **AVERY & CO.**, Solicitors, 34, Finsbury Pavement, E.C.; at the place of sale; of Mr. J. **CRAWTER**, 41, Bedford Row, W.C.; or of Messrs. **CRAWTER**, Land Agents and Auctioneers, 9, Cheshunt, Herts.

**To Manufacturers, Building Societies, Nurserymen AND OTHERS.**—BLAKE AVENUE ESTATE, situated about 2-mile from Angel Road Station, G.E.R., and the Lea Navigation. It contains an area of about 21½ acres, with important frontage of 550 feet to the main road, from Angel Road to Waltham Cross; with possession.

**MESSRS. WOOTTON AND GREEN** will offer the above for **SALE** by **AUCTION**, at the Mart, E.C., on **FRIDAY**, July 3 (in one lot).

Particulars of Messrs. **TAYLOR, HOARE AND PILCHER**, Solicitors, Amberley House, Norfolk Street, Strand, and of the Auctioneers, 38, Gracechurch Street, E.C.

**WANTED TO RENT, or PURCHASE,**

90, Wardour St., London, W.  
Or may be obtained of any respectable Ironmonger in the United Kingdom.

**MUNGO CHAPMAN**, late of Easter Duddingston Lodge, Mid-Lothian, begs to intimate to his friends and acquaintances that he retires from his present situation on the 20th of the present month. He has arranged to reside at St. Ninians, near Stirling, where he intends to commence the Cultivation and Sale of Hardy Plants on his own account.

With the experience gained during twenty-four years in the management of one of the most choice private collections of plants to be found in the British Isles—that of the late Charles Jenner, Esq.—Mr. Chapman can confidently undertake to supply what is select and true to name of the most suitable plants for Borders and Book-work.

He hopes to be able soon to issue a Plant Catalogue, from which customers may make their own selection. In the interval, he will be fully employed in getting up Stock.

May 19, 1896.

## PRIMULAS! PRIMULAS! PRIMULAS!

26th year of Distribution.

Williams' Superb Strain, 1s. 6d. per dozen; 10s. per 100.  
CINERARIAS, same price; also, PRIMULA OBCONICA, 2s. 6d. per dozen; DOUBLE WHITE PRIMULAS, 6d. each.

JOHN STEVENS, The Nurseries, Coveotry.

## ORCHIDS — ORCHIDS.

Clean, healthy, well-grown plants at reasonable prices; many large specimens and rare varieties.

### CHOICE DENDROBES A SPECIALTY.

PLEASE WRITE FOR LIST.

**JAMES CYPHER,** EXOTIC NURSERIES,  
CHELTENHAM.

### SPECIAL OFFER.

Ferns in variety, our selection, in small pots, for sale or to pot on; Maidenhaars, in about 5-inch pots; Dahlias, out of single pots; Pelargoniums: Show and Regal, in small pots. Fuchsias; Cannas; Ivy; Gold, Silver, Green, in variety, &c., &c. Palms: Kentias for Table Plants, &c.

SHUTTLEWORTH, Limited, Fleet, Haats.

## DUTCH BULBS.

WE are at present Booking Orders for First-rate Bulbs, true to name, to First-class Houses.

TULIP (Single), Verboom ... ..	22s. per 1000.

## THE POETRY OF GARDENING.

HORTICULTURE is practical, but it is also poetic, for it is Nature glorified by the efforts of earnest Art; and Nature, with all the moral and elevating influences her impressiveness can impart, has always been the poet's predominating theme. And thus Homer, who drew his majestic imagery from the scenery by which he was so grandly environed, and though blind could perceive the vast harmonies of Nature, sang of the Narcissus (not Poeticus, but Tazetta); while "burning Sappho," the great Grecian poetess, described in passionate strains the glories of the Rose.

In the "Edipus at Colonus" of the immortal Sophocles, whose thoughts have found expression in many of our most intensely classical poets, such as Thomas Grey, Tennyson, and Matthew Arnold, we find the following memorable tributes to the Narcissus and the Crocus:—"Stranger in this land of goodly steeds, thou hast come to earth's fairest home, even to our white Colonus, where the Nightingale, an abiding guest, trills her clear note in the fair recesses of the verdant glades, dwelling amid the Ivy, dark as wine, of the gods' immaculate bowers. And, bed of heavenly dew, the Narcissus blooms morn by morn with fairest clustering flowers, crown of the great goddesses from of yore; and the Crocus shines with golden ray." Virgil and Propertius, two of the most highly gifted of the Roman singers, eulogised the beautiful and stately Madonna Lily, which still adorns our gardens, even as it did the sweet valleys of Italy, on the bright confines of July; blooming contemporaneously with the first efflorescence of the Rose. A greater Spirit than these has said of such flowers as those of Liliun candidum and the Scarlet Martagon: "Even Solomon in all his glory was not arrayed like one of these."

William Shakespeare, that "myriad-minded" man, who sang of the Daffodil that it comes before the swallows dare, and takes the winds of March with beauty, has a passage peculiarly touching in its gentle inspiration, in which music is etherealised by a most subtle and delicately-conceived association with the fragrance of flowers—

"That strain again! it had a dying fall;  
O, it came o'er my ear like the sweet South,  
That breathes upon a bank of Violets,  
Stealing and giving odour."

Sublimity and simplicity were combined in Milton, whose wings seldom faltered in his loftiest flights. But it is not in his mighty *Paradise Lost* that we find his grandest delineations of the fairest forms of Nature. It is in

his profoundly impressive *Lycidas*, written like Arnold's long-subsequent *Thyrsis*, to the memory of a friend, that what is perhaps the finest floral passage in our literature is found. Lest it should be unfamiliar to any of my readers, I quote it here:—

"Bring the rathe Primrose, that forsaken dies;  
The tufted Crow-toe, and pale Jessamine;  
The white Pink, and the Pansy freaked with jet,  
The glowing Violet,  
The Musk-rose, and the well-attired Woodbine,  
And Cowslips wan, that hang the peevish head,  
And every flower that sad embroidery wears;  
Bid Amaranthus all his beauty shed,  
And Daffodillies fill their cups with tears,  
To strew the laureate hearse where Lycid lies."

Cowley, who was greatly devoted to Horticulture, has recorded in his *Plants* in most expressive language, at once its inspiring and tranquillizing power. Keats, Shelley, Burns, and Byron were intense lovers of Nature, and therefore also of her floral creations in the gardens, the shadowy woodlands, and the open sun-illuminated fields, where the most idolised of Scottish bards beheld the perfect beauty of the Daisy, and made it immortal by one imperishable strain; but practical gardening was the antidote most intensely demanded by their fiery natures to hush them by its benignant influence into rest. Tennyson perceived the divinity enfolded in a flower; Wordsworth communed alone with Nature, and therefore could teach us in his *Ode to Immortality*, the sublimity realisable in the smallest things of earth.

I have already written of Matthew Arnold in the *Gardeners' Chronicle* as a follower of Wordsworth, and a lover of flowers; and, indeed, his beautiful, deeply-classical poetry, and that of his great master, the "High Priest of Nature," were nearly akin. What poet has sung more touchingly than Arnold of such familiar beauties (to an English reader) as the white and purple Fritillarias of the Oxfordshire fields; of

"Sweet William, with his homely cottage-smell;"  
of—

"Roses that down the alleys shine afar;"  
and of—

"Dark Blue-bells drenched with dews of summer  
eves?"

The "Poet of Culture" became absorbed in the worshipper of Nature, when he wrote such inspirations as his *Thyrsis* and the *Scholar Gipsy*, which I hope the world will not willingly let die. They have in addition to their tender, pastoral beauty, which has never been surpassed, this higher and infinitely more distinctive value; that therein the great poet feels the pulse of modern life. He deeply sorrowed over what he called so impressively "its palsied heart." He did much by his utterances to mitigate its fever, for his poems are most powerful to chasten and subdue. *David R. Williamson*.

## NEW OR NOTEWORTHY PLANTS.

### ONCIDIUM (PENTAPETALA, MICROPETALA) GODSEFFIANUM, *Krzel, n. sp.*

At first sight the plant resembles *Oncidium pubes*, but even with the naked eye the first difference—viz., the divided sepals—is readily observed, and closer

\* *Oncidium* (*Pentapetala*, *Micropetala*) *Godseffianum*, *Krzel*, n. sp.—Bulbis elongatis cylindricis teretibus ad 12 cm. longis, v. imo longioribus 1 cm. crassis siccis rugosis (non angulatis) foliis 2 linearilanceolatis acutis; panicula longe pedicellata nutante; ramulis distichis densifloris; bracteis minutissimis triangulis; sepalis dorsali cucullato cuneato obovato, sepalis lateralibus ad quartam partem coarctatis ceterum liberis, parte libera oblonga acuta; petalis obovatis

examination reveals other discrepancies of no less importance. The middle lobe of the lip is rather broader than it is long, cordate, with a slight tendency to become bilobulate at the apex; the callus of the lip is covered with numerous small waxy warts, and a smaller callus, going out into three lines of little warty excrescences, is observable at the base of the middle-lobe. The side-lobes are not very large, but far larger than in *Oncidium pubes*, Lindl., and they are bent backwards. The arms of the column are narrow, and, like the border of the anther-bed, pubescent. Finally, the flowers are scarcely half the size of good specimens of *Oncidium pubes*. The bulbs are loog, cylindrical, 5 inches or more, and even when dried, not angular. In spite of much resemblance, the plant does not agree in its habit and size, nor in the botanical characters with the two plates in the *Botanical Magazine*, 3109 and 3926, and the descriptions, till to-day.

It is, of course, with some hesitation that I resolve to add another species of *Oncidium* to the crowd of more or less well-described shadow-like plants of uncertain affinities, the descriptions of which fill the pages of our botanical works. I have made the diagnosis as accurate as fresh flowers allow it to be done. It is curious that two *Oncidia* so similar at first sight in shape and size should belong to two quite different tribes. *Oncidium pubes*, Lindl., has the lateral sepals united to the top into one two-toothed leaf, and belongs to the Tetrapetala, whereas *O. Godseffianum* must be placed under the Pentapetala, Micropetala. In conclusion, I would remark that the three plates of *O. pubes*, Lindl., should be examined to ascertain if they represent in fact the same species. The plates in *Bot. Mag.* 3109 (*Oncid. bicornutum*, Lindl.) and 3926 (*Oncid. pubes* var. *flavescentis*), represent, according to my opinion, not the same species, as Dr. Hooker declared afterwards. The third (or, chronologically, the first) in *Bot. Reg.*, t. 1007, is very bad, but the description of *Oncidium pubes* is the best and most accurate that we have in our literature. Even there the coalescence of the two lateral sepals is pointed out: "Sepala . . . inferius dependens . . . apice bilobum." The plant flowered at St. Albans, in the collection of Messrs. F. Sander & Co., in May of the present year. *F. Kränchin*.

### LÆLIA PURPURATA MRS. DE B. CRAWSHAY, *nov. var.*

There are several distinct sections of *Lælia purpurata*, the more distinct of which are the old dark form with purple veining on the sepals and petals, and maroon-purple lip; the nearly white-petalled form of the same large type; and the lighter-coloured rose-tinted class, of which *L. p. Russelliana* may be taken as type, and which are thinner in texture than those. The new form, *L. p. Mrs. De B. Crawshay*, differs in several particulars, and especially in the base of the lip being clear white, the fine lines usually springing from it starting half-way up the tube; in the roundly-expanded front portion of the lip, which is closely crimped at the edge, a very distinct and attractive feature, and the whole flower presents several other fine distinct points which the eye of the expert will readily appreciate but can hardly describe. The sepals and petals are of a soft French-white, the surface glistening in a bright light. The lip is large, of a pure silvery-white, the middle area being coloured purple and of a velvety texture, changing to rose-pink as it approaches the distinct, clear white apex. The colour is obscurely traversed by fine purple lines, which spring from the middle and not from the base of the lip. This new form seems representative of a section of which others may appear out of the same importation. *J. O'B.*

unguiculatis obtusis; labelli brevi-unguiculati lobis lateralibus retrorsis falcatis minutis, intermedio lato cordato apice subbilobo, callo plurituberculato (tuberculis minutis) nitido in ungue et inter lobos laterales, callo altero lato in lineas 3 tuberculosas excurrentes in disco lobii intermedii; gynostemii albis linearibus antice obscure denticulatis margine androclinii fovea stigmatica latissima; antheris pubescentibus, anthera margine non bilobulo reflexo. Flores inter minores generis 2 cm. latis (pat. expansis) vix 1½ cm. altis, luteis purpureo-vittatis. *F. Kränchin*.

## A CONTRIBUTION TO THE HISTORY OF PANSIES.

(Continued from p. 728.)

SUMMARY.—As the chief result of our investigations, we see that the Pansies of the present day form an aggregate of very different forms of plants produced by hybridisation between various species of the genus *Viola* (sect. *Melanium*). Their original stock was *V. tricolor*, L., but several other kindred species of *Viola* have been crossed thereon, and one among them, *Viola lutea*, Huds., to such a degree that it has probably had a larger share in the production of the Pansies of the present day than *V. tricolor*. Thus in their entirety they cannot exactly be compared to what in systematic botany is termed species or variety. They certainly should not be called by a name formed according to the rules of binary nomenclature. If a general Latin name seems desirable, I should propose *Viola × hortensae grandiflora*, when "×" signifies the hybrid nature of the forms belonging hereto; the word "hortensae" that they are garden plants; and the word "grandiflora," that they are large-flowering; this to distinguish them from the small-flowering garden *Violas* of the type of *Viola odorata*, L.

On comparing the Pansies of the present day with their wild ancestors, we shall find that as regards form, the most conspicuous characteristic of the Pansy flower is that its cross diameter is almost the same as its long diameter, or that it is nearly circular, while in the parent species the flower is constantly much longer than it is broad. The large cross diameter of the Pansy flower is a consequence of an excessive development, more especially of the middle petals. It not unfrequently happens that these petals are the largest, which is never the case in the parent species.

As regards the spur, the Pansies generally follow the short-spurred parent species, *Viola tricolor*, L., *V. lutea*, Huds., and *V. altaica*, Ker. Only a very few Pansies are long spurred,\* these showing their descent from some of the long-spurred *V. coronata*, L., *V. calcarata*, L. (or *V. stricta*, *Dicksons & Co.*).

In respect to colouring, Pansies show a far greater variety and wealth than all the parent species, whatever variety of colour a couple of these may present. There is scarcely any colour or shade—with the exception of green, which is so unusual a colour in flowers—that it is not represented in one variety of Pansy or the other. Selves are white, yellow, red, violet, blue, brown, and black. The colours most difficult of production for the Pansy-raisers are pure blue and pure red. There are now, however, blue Pansies of several kinds. Clear reds in fiery-red and blood-red are still a desideratum.† Many-coloured Pansies, as is well known, exist of almost innumerable kinds. That which is common to nearly all of them—but is not found in the parent species of the Pansy—is the large dark blotch at the base of the three lower petals. These blotches are evidently derived from the dark rays of the wild ancestors of the Pansy.

Whatever variety of colour the Pansy may show, one part of the flower is always of the same colour, viz., the so-called eye, or that part of the lowest petal, which is immediately in front of the entrance to the spur. This eye, called by botanists the honey-guide, is always bright yellow, and is the same in all Pansies, even in selves. This yellow spot, which is the guiding star to insects when visiting the flowers—which is of such great importance for the fertilisation—seems to have reached such a degree of resistance to all the changes of outer life that it will not give way to anything.

The same seems to be the case as regards the colour of the spur, as in all Pansies which I have had the opportunity of examining—even the pure white, pure yellow, &c.—the spur, at any rate towards the tip, is coloured with violet of a lighter or darker shade.‡ Why the violet colour so perseveringly

\* E.g., *Coronata Perfection* and *Ariel*.

† A couple of the very latest kinds, viz., *Cardinal*, in fiery-red, and *Victoria*, in blood-red, are very near the mark.

‡ Both as regards the colour of the eye and the spur, the Pansies thus agree with *Viola tricolor*, L.

remains through all circumstances on this limited spot, is not easy to explain. It is probable that it serves as a kind of protection for the honey contained in the upper part of the spur.

Finally, let us see what problems are still to be solved by the Pansy-raisers in the immediate future.

Foremost amongst these we must place the question of making the Pansies perennial instead of annual or biennial. A remarkable step in this direction has already been taken by the English and Scotch Pansy-raisers, who, with very good results, have used the perennial *V. cornuta*, L., for crossing with garden Pansies. Much, however, still remains to be done. Those species of *Viola* most suitable for Pansy hybridisation are undoubtedly *V. calcarata*, L., and *V. altaica*, Ker, as both have a very powerfully developed perennial stem, have large and beautiful flowers, and can both of them without any difficulty be cultivated in our gardens. Another species that deserves recognition is *Viola latispala*, Wettstein, lately introduced into our gardens from the Balkan peninsula, a perennial species which, on being cultivated here, has evidently thriven remarkably well.

Next to obtaining perennial Pansies, we must place the aim of producing good varieties that come true from seed. In many places these attempts have been crowned with tolerable success, more especially in respect to the self; but very much still remains to be done.

No pains have been spared of late by the Pansy cultivators of Great Britain to increase the charm of the Pansy by obtaining perfume as well as beauty; but by a more extensive use of the odoriferous alpine species, *Viola cornuta*, L., and *V. lutea*, Huds., var. *grandiflora* (L.) Vill., for hybridisation, doubtless much may still be done in this direction.

Probably in direct opposition to most Pansy-raisers, I consider it most desirable to obtain more variety as regards the form of the corolla of the Pansy. For sixty years the Pansy cultivators have almost unanimously endeavoured to make the corolla of the flower as circular as possible; and it is undeniable that the corolla type obtained by these means, and now reigning almost supreme, is beautiful—ay, very beautiful; but this fact does not prevent other forms of the corolla from being as attractive to the eye that has learnt to admire those products which Nature herself offers us.

As in a wild state *Viola tricolor*, L., produces pelorians both with and devoid of spurs, the raising of Pansies of a similar structure should not present insurmountable difficulties. A similar form has long been under cultivation from *V. odorata*, L. If, in addition to this, we remember the existing forms of the double Pansies which, by suitable cultivation, may doubtless be greatly improved, it seems to me that it is very probable that our gardens will be in time adorned with Pansies which give the impression of wealth and variety, not only as regards colour, but also in respect to form.

At all events, it may in truth be said that—even if only remembering what has already been done—the garden Pansies plainly prove what human intelligence, coupled with skilful perseverance, can perform in a department where it is a question of giving pleasure to millions by caring for, improving, and multiplying plastic forms of those lovely plants which Nature, even in the North, so generously offers us. *Professor V. B. Wittrock, Stockholm.*

### STRAWBERRIES AS ANNUALS.

I HAVE had abundant proof of late of the exceptionally free-blooming and fruiting of last year's runners this year. This, as might be expected, is most conspicuous among such early varieties as *Vicomtesse*, *Noble*, *Earliest of All*, *Royal Sovereign*, &c. It will probably be found that the earlier any variety, the more successfully it will lend itself to annual treatment. In the days of the old *Black Prince*, and when *Keen's Seedling* was the premier fruit (and it is still one of the best), it was

found that runners rooted during the process of forcing fruited the first year. For many years, too, the practice of fruiting maiden plants, and growing the finest Strawberries from such, has been practised by Mr. Wm. Allan of Gunton, and other successful growers.

The secret of success in the treatment of Strawberries as annuals lies in securing early runners. In the olden times we obtained these at various periods from forced plants. To dispense with these, and rely on profitable crops obtained from open-air runners, is a rather different (perhaps more difficult) matter. Earlier varieties, warmer soils, the more express rooting, and liberal growth and early maturity of runners, are probably the main conditions to not only invite but command success. As to varieties, the finest from last year's runners seen this year were from *Noble*, *Earliest of All*, *Royal Sovereign*, and *Sir Joseph Paxton*. Light soils are doubtless the most suitable for the growth of Strawberries as annuals. All the finest examples I have yet seen have been on warm, perhaps shallow, rather poor soils. No

more Strawberry plants a second year. The crop assuredly confirmed the wisdom of his resolution in that particular case; but within distances of from about 20 miles other illustrations could be found pointing in other directions. While last year's runners have few or no fruit, there is no special reason why the annual plants should suddenly supersede those of older growth; there is room enough in most gardens for both.

By all means grow Strawberries that seem best adapted for treating as annuals on this method; and also try those that have not been found wanting on the old lines of culture in the past a second or even a third season. For years the second crop has been reckoned the biggest and the best. It may save time and money should we generally succeed in placing the first or maiden crop in that proud and profitable position. *D. T. F.*

### MILTONIA VEXILLARIA "MEMORIA G. D. OWEN."

OUR illustration (fig. 129) represents a flower of the beautiful *Miltonia vexillaria* "Memoria G. D. Owen," which was exhibited by Sir Frederick Wigan, Clare Lawn, East Sheen, Richmond (gr., Mr. W. H. Young), at the Royal Horticultural Society on June 9, when it received a First-class Certificate. Of the section first made known to gardens in the handsome *M. vexillaria superba*, which first flowered in Sir Trevor Lawrence's collection, and which was followed by *M. vexillaria Leopoldi*, which still more closely approaches the variety under notice, the *M. vexillaria* "Memoria G. D. Owen" is certainly the most beautiful and richly-coloured of any form of the variable species, its superiority to others of its class consisting not only in the finer colour, but in the larger size of its flowers. The latter are of a clear rose-pink colour, with dark reddish-purple markings in the centre, which may be not inaptly likened to some gorgeously-tinted butterfly.

FIG. 129.—MILTONIA VEXILLARIA "MEMORIA G. D. OWEN."

### BRITISH FERNS.

THE monthly meeting of the National Amateur Gardeners' Society was held at the Memorial Hall, Farringdon Street, City, on Tuesday evening, June 2, when Mr. George Gordon, one of the vice-presidents, gave a lecture on British Ferns, with special reference to their cultivation in gardens of limited dimensions. Mr. T. W. Sanders, president, occupied the chair, and there was a large attendance of members, and an extensive exhibition of British Ferns, Mr. Vokes of Southampton, Mr. Leonard Brown, Mr. Sinclair, and Mr. Harrison, staging collections of splendidly-developed specimens.

Mr. Gordon, in his opening remarks, said he did not intend in the comparatively short space of time at his disposal, to speak of the life-history of Ferns or discuss the marvellous processes by which their multiplication is effected, and new and beautiful forms created. He should, in compliance with the request that had been made to him, confine himself to their cultivation, in which he was pleased to learn the members were much interested. He was glad of this, because it justified the hope that the Ferns indigenous to the United Kingdom would at no distant date receive the attention from the general body of amateurs they so well merited, and that some, at least, of the many beautiful forms of the principal species would be represented in all gardens where beauty of form, as well as attractive colours, were appreciated. He should not attempt to exalt the native Ferns at the expense of those from other parts of the world, or indeed at that of other classes of plants; but he would claim for them that they would afford unbounded pleasure to those who gave them the attention necessary to the full development of their manifold charms. Upon this point he could speak from experience. It was now many years since he turned his attention to British Ferns, and, although he had not made a list of them to the exclusion of other plants, he had from the first grown a representative collection, and

grower needs to be reminded of the supreme importance of the early and special culture and perfect maturity of the runners if they are to yield a profitable crop as plants a year old. As, in fact, all the crowns, in size, strength, maturity, in the autumn of the one year, so will and must be the crop the next June.

Now, in several examples seen quite recently, two points were specially noted. The first was, the complete success resulting from the treatment of the plants as annuals; and the second was, the very indifferent condition of some of the same varieties growing and fruiting side by side for the second crop this year. In some cases the object-lesson was far too glaring to prove convincing. No doubt a good deal of this disparity arose from the long-continued drought this season. The younger plants, with their new stores of energy, bore up against and mastered the drought much better than the older ones, though the latter were only two years old. The difference in favour of the annual plants from crops grown side by side was remarkable, not only in large quantity, but superior quality.

Many may question the wisdom of what was said recently by a market grower, viz., that he would fruit

had annually obtained from it many useful object-lessons in plant life, and an immense amount of pleasure. The enjoyment he had derived from the culture of British Ferns was within the reach of the humblest amateur, for the possession of a large collection, or rare forms, was not essential.

The cultivation of British Ferns had not during the past thirty years extended so rapidly as could have been desired, and for this there could hardly be any doubt the Fern specialists were in the main responsible. From thirty to forty years ago there was almost, if not quite, a mania for British Ferns, and a brisk demand sprang up for the forms of the principal species. To satisfy this demand plants were raised in large numbers from spores, and seedlings showing a slight difference in the size and form of the frond, no matter whether the difference contributed to or detracted from the beauty of the plant, were distributed under long, cumbersome, and unpronounceable names. In time cultivators grew tired of adding varieties showing trifling variations to their collection, and also of the frightful names inflicted upon them. He had no sympathy with those who objected to scientific names of all kinds, but in the case of varietal forms of British Ferns, as of other plants, the names should be simple and appropriate. Happily, there had of late years been a change for the better; raisers had recognised the importance of new varieties possessing both distinctness and beauty, and that cumbersome names are not desirable.

There were, it was pointed out, several ways of commencing the cultivation of British Ferns. If the cultivator is satisfied with the specific forms, and has access to woodlands and hedge-rows where Ferns are abundant, he can make a beginning by transferring the requisite number of plants from their native haunts to his garden; if he has no such access, it will be open to him to purchase the plants from a nursery or the coster's barrow. But no one should, except in one or two instances, be satisfied with the species, with such a wealth of beautiful forms. The Male Fern, the Lady Fern, and Broad Buckler Fern and the Hart's-tongue, when growing luxuriantly in great masses, as they may be seen in Devonshire Somerset, Cumberland, Yorkshire, and some other counties that were mentioned, were singularly beautiful; but their places are the woodland, the hedge-row, and the shady lane, and not the garden. Especially was it desirable that those who had but little space in which to indulge their taste for plant culture should take advantage of the most beautiful forms Nature had provided for the embellishment of their gardens. The practice which obtains of purchasing Ferns that have been dug up after they have commenced to make new growth, and hawked about the streets, was very strongly condemned. In the first place, plants that had been so dealt with seldom survived, even with the greatest care; and in the second place, those who bought the plants assisted and encouraged those who were engaged in stripping some of the most beautiful parts of the country of one of their greatest charms. Few, said Mr. Gordon, had an adequate idea of the rate at which the country is being despoiled of its beauty for the purpose of supplying the demand for Fern roots during the spring months, and he earnestly hoped that all who were in any way interested in the rural aspects of the country would do their best to discourage this vandalism. Some objection to the practice would be removed if the plants were utilised in beautifying town gardens, but of the thousands that were annually sold, not more than 5 per cent. survived.

The proper, and indeed the only course that should be taken in beginning Fern culture, was to purchase nicely-established plants from a nursery in which a representative collection is grown. The varieties of the several species were stated to be so numerous, and to evince so great a diversity in character, as to afford a wide range for selection. To show the wonderful variation of the British Ferns, it was mentioned that Mr. E. J. Lowe described, in his small work entitled *British Ferns*, 1,859 varieties, of which 34 were forms of *Adiantum capillus veneris*, 16 of *Asplenium Adiantum nigrum*, 313 of *Athyrium filix-femina*, 75 of *Polypodium vulgare*, 394 of

*Polystichum angulare*, 34 of *A. aculeatum*, and 450 of *Scolopendrium vulgare*. The diversity of character afforded by the varieties was shown by specimens of about fifty of the finest forms brought by the lecturer to illustrate his remarks. It was, of course, not necessary the cultivator should commence with any considerable proportion of the immense number of varieties. So far from this being the case, he advised the beginner to be satisfied with a few only at the first, and to increase his collection as opportunities offered. He suggested the following as comprising the best for forming the nucleus of a collection: *Applebyanum*, *corymbiferum*, *cruciatum*, *curtum multifidum*, *Elwerthi*, *Frizellie cristatum*, *glomeratum*, *plumosum*, *plumosum multifidum*, *plumosum elegans*, *ramo-cristatum*, *setigerum*, *Vernonie* and *Victoria*, of the varieties of the Lady Fern (*Athyrium filix-femina*); *crispato-cristata*, *foliosa-digitata*, and *grandiceps*, of the Broad Buckler Fern (*Lastrea dilatata*); *Bollandiae*, *digitato-Jonesi*, *fluctosa*, and *grandiceps* of the forms of the Male Fern (*Lastrea filix-mas*), *cristata* and *grandiceps* of the forms of *L. propinqua*, and *cristata angustata*, *cristatum* and *ramo-cristata* of the forms of *L. pseudo-mas*; *bifido-cristatum*, *cambricum*, *trichomanoides*, *cristatum*, *grandiceps*, *pulcherrimum*, and *semi-laceratum* of the varieties of the common *Polypody* (*Polypodium vulgare*); *Baylis*, *cristato-Jonesi*, *divisilobatum plumosum*, *folioso-multifidum*, *grandiceps*, *remoto-decurrens*, and *tripinnatum elegans* of the forms of the Prickly Shield Fern (*Polystichum angulare*); and *conglomeratum*, *crispum*, *crispum majus*, *crispum Stableri*, *cristatum*, *cristulatum*, *digitatum majus*, *grandiceps*, *laceratum*, and *ramo-marginatum* of the forms of the Hart's-tongue (*Scolopendrium vulgare*). The cultivator who had made considerable progress with British Ferns would not be satisfied with the varieties of the species he had mentioned, but would include in his collection the various *Spleenworts*, the *Hard Ferns* or *Blechnums*, and the *Bladder Ferns* or *Cystopteris*, of which there were many beautiful forms; and the *Oak*, the *Beech* and *Royal Ferns*, the last-named being especially useful for planting in moist positions.

Proceeding to speak of the cultural requirements of British Ferns, it was pointed out that the *Athyria*, *Lastreas*, *Polystichums* and *Scolopendriums* thrive in any good garden soil, and that the *Polypodiums* make the most satisfactory growth in peat. When the soil is close in texture, a liberal addition of grit, decayed vegetable refuse, and charred rubbish would be advantageous; but maiden loam, so frequently recommended for Ferns to be grown in the open, was an expensive luxury that could well be dispensed with. An ideal position for Ferns in the open was said to be a border on the north side of a wall, fence, or hedge, where the Ferns would be screened from the direct rays of the sun, and not be exposed to sharp currents of air. It was strongly advised that when Ferns are planted above the level, the mound or bank should be of sufficient depth to contain a good body of soil, so that it may not get dry so quickly as to expose the plants to the risk of injury from a few days' hot, dry weather. With reference to the formation of rockeries on which to plant Ferns, it was suggested that the best results would be obtained by forming an irregular bank of soil of the desired length and depth, and then with burrs, pieces of tufa, sandstone, or other available material, arrange a series of ledges, and plant the Ferns in amongst them. When this is done, it was pointed out that the soil, plants, and rockwork sink together. It would, after a little practice, be found a simple matter to so arrange the material used for facing the bank as to give it much the aspect of a natural rockery, and prevent the water running away down the slope instead of soaking into the ground. One of the most important points in the cultivation of British Ferns in the open was to keep them well supplied with water during periods of dry weather early in the season. Speaking generally, overhead sprinklings were described as of but little value as compared with copious root waterings. It was advised that while the soil must not be maintained in a saturated state, sufficient water should be applied

to thoroughly moisten it to the depth to which the roots have extended.

The cultivation of British Ferns in pots was lightly touched upon, and it was suggested that by the aid of a good selection many greenhouses and conservatories occupying shaded positions in town gardens, and now bare and desolate, might be converted into veritable Fern paradises. The essential conditions of success were said to be well-drained pots, a substantial compost, careful watering, and shade during bright weather. With reference to the compost, one consisting of turfy-peat, liberal proportions of leaf-mould and sand, was recommended for the *Polypodiums* and *Spleenworts*; and for the *Athyrias*, *Lastreas*, *Polystichums*, and *Scolopendriums*, a compost consisting of turfy-loam, leaf-mould, powdery cow-manure, and coarse silver-sand, was advised. The importance of moistening the whole of the soil at each watering was insisted upon, and it was pointed out that when the plants are at rest the soil should be maintained in a moderately moist state, for when, as so frequently happens, the soil is allowed to become dust-dry, and remain so for any considerable period, the plants are greatly injured, if not killed. Repotting in spring was advised, but it was pointed out that annual repottings were not necessary, as the plants could be maintained in the most vigorous condition for several years without disturbance at the roots, by assisting them with weak liquid-manure—that prepared by steeping cow-manure in water and used in a highly-diluted state, being recommended as the best.

At the close of the lecture, hearty votes of thanks were accorded the chairman and Mr. Gordon.

## METHODS OF PROPAGATION.

(Continued from p. 698.)

**LAYERING.**—This is an operation almost universally resorted to in the best home nurseries, but more seldom used on the Continent. As noted in my first article, *Camellias*, *Azaleas*, *Rhododendrons*, and many other subjects now grafted, were increased by this method less than half a century back, and now most planters prefer "own-rooted" plants to those grafted, there then being no danger of the stock "spawning-up," i.e., throwing up "suckers," and so in time over-growing and killing the graft or bud. I have often seen beds of varieties of *Rhododendrons* reduced to more than half *R. ponticum* by neglecting to cut away the growths from the stock as they show themselves.

Layering presents the same relation to cuttings that inching does to grafting. In both cases the young plant, *in posse*, is still attached to its parent, and not till it can run alone must the connection be severed. Preparatory to the operation of layering in the nursery, "stools" are formed; for instance, a variety or species of *Rhododendron* is planted in suitable soil, generally in a sheltered position, if possible by thick hedges of *Beech* and *Privet* intermixed.

This *Rhododendron*-plant is cut hard back in the early spring after it has become well established; and the young shoots, which spring up in profusion from adventitious buds all round the parent-plant, form the stool. If the adjacent soil be moderately rich, no addition to it will be needed, but a small coat of well-decayed dung may be dug in, one good spit deep, early in the year, if it be poor soil.

Now prepare a supply of *Hazel* or *Hornbeam* pegs, from 9 to 12 inches long, and a barrowful of mixed sandy soil, and begin to work; though if there be much to do, a kneeling-pad is a very desirable thing to have, besides a narrow, flat trowel, called a layering-spud, about 10 inches in the blade.

First make a deep cut into the prepared bed the full depth of the spud, and put into the cleft a little of the mixed compost. Now select one shoot opposite to the cleft, and bending it gently, fit it into the hole made, noting the point where it touches the bottom. Next take the bent shoot in your left hand, and cut a so-called tongue, beginning the incision just below a bud, and terminating at such a distance up the shoot, and twist the cut portion, bringing the base of the cut below the shoot. This is a delicate

operation, and care must be taken lest the elasticity of the bent-down shoot does not sever the tongued layer from its parent shoot. This being avoided, take a peg in your right hand and placing the hoop over bend in the layer, press it into the ground firmly, and then fill up the cleft or pit with prepared soil, ramming up carefully with the spud-handle as the work proceeds, continuing the operations till the whole of the stool is layered, then afford the whole a good watering, but not so much as to make a puddle of the soil, or the recoil of some of the strong shoots may draw the pegs and lift the layer from its bed.

Niel Rose, &c. Bignonias and Clematis may be laid down for the entire length of their flexible shoots, burying a few nodes, and leaving a few above the surface, each portion will then root and eventually make growth from the eyes left above ground, and the following February and March, may be cut free, lifted, and potted. All will not be rooted, but the rest will be "callused," and by keeping them in a close warm pit for a few days, and shading from direct sun, they will soon make serviceable plants.

*Experience.*

(To be continued.)

range from pure white to rich crimson in colour. Not the least noteworthy of these is one called Mrs. Anthony Waterer, which was raised a few years ago in the Knapp Hill Nursery by crossing *R. rugosa* with the H. P. General Jacqueminot. In the strength and sweetness of its perfume, and in its great wealth of blossom, it is scarcely inferior to any Rose in cultivation. The flowers, which are semi-double, measure from 3 to 4 inches across, and we have had open at one time as many as eighty flowers on a single shoot. The leaves, usually consisting of five leaflets, have the same firmness of texture as those of *R. rugosa*, but are neither so wrinkled nor so glossy. Whilst the foliage follows more closely that parent than the other, the habit is much more free and graceful. The wood is thickly set with short decurved spines much stouter than those of *R. rugosa*. Perhaps the best of the white *R. rugosa* forms is Coubert's Double White; it has large double flowers, the petals of which are of a singularly pure, papery white. It was awarded a First-class certificate by the Royal Horticultural Society's Committee last year when shown by Messrs. Paul & Son, Cheshunt.

THE DAWSON ROSE.

This is a new Rose which originated in the Arnold Arboretum, Mass., U.S.A., having been raised by Mr. Jackson Dawson, a member of the staff of that famous establishment, and after whom it is named. He crossed *Rosa multiflora* (*R. polyantha*) with General Jacqueminot, and the result has been to add to our gardens a new Rose of singular beauty and quite distinct from any other. In its mode of flowering it bears much resemblance to Crimson Rambler, but for cultivating as a bush out-of-doors its habit is much superior. It sends out in every direction long, arching, fountain-like sprays, which, at this season of early June, are loaded with semi-double flowers of a soft shade of pale rose. The flower has much the same size and character as that of Crimson Rambler. The leaves are of a shining, dark green, and the stipules have, to some extent, the fringed edges which constitute so well-marked a character in *R. multiflora*. A group of about half-a-dozen plants has been a feature in the collection of Roses at Kew for two or three weeks past. W. J. B.

FIG. 130.—TULIPA MAXIMOWICZII (REGEL): FLOWERS BRIGHT CRIMSON.

All subjects do not need tonguing, some root equally well with merely a sharp twist at the buried point. There is no hard-and-fast rule for this, but generally, all plants of a climbing habit root freely from their nodes (joints), assisted by a slight twist above the point covered with soil, but even with these tonguing (as it is called), tends to a rapid formation of roots. Climbing plants—as Virginian Creepers of sorts, Aristolochia, Maréchal

TWO NEW HYBRID ROSES.

ROSE MRS. ANTHONY WATERER.—The hardiness and beauty of *Rosa rugosa*, as well as the vigour and distinctness of its habit and foliage, have led to its being a good deal used in recent years for purposes of hybridisation. There is now at Kew a series of about a score distinct varieties and hybrids, raised on the Continent and elsewhere, whose flowers

TULIPA MAXIMOWICZII, REGEL.\*

THIS crimson Tulip, with linear-erect leaves, and obtuse perianth-segments, ending in a short sharp point, was exhibited at one of the recent meetings of the Royal Horticultural Society by Messrs. Barr & Sons under the name of *T. linifolia*. An inspection of the figures of the two plants will, we think, be sufficient to show that the plant now figured can hardly be referable to *T. linifolia*, Regel, which has undulate recurved leaves spreading on the ground, and obovate-retuse, not pointed perianth-segments. *T. Maximowiczii* (fig. 130) has perianth-segments and stamens glabrous, the sepals marked with a black spot at the base, light purple anthers, a glabrous peduncle, and linear leaves. The outer bulb-scale is villous. The figure in the *Gartenflora* was probably derived from a dried specimen, and hence conveys a poor impression of the plant. Tulips, as we have had occasion to note, vary extremely when submitted to cultivation. M. T. M.

ORCHID NOTES AND GLEANINGS.

MILTONIA FLAVESCENS.

THIS Brazilian species, a somewhat old inhabitant of our gardens, is one of the most attractive of the genus, with its graceful sprays of flowers, having pale yellow sepals and petals, and a white lip spotted with purple. A specimen sent by Gustav Kleinjung, Esq., of Brookhurst, Alderley Edge, Cheshire, exhibits its peculiarities, and the accompanying letter is interesting as showing how these plants grow mixed in

\* *T. Maximowiczii*, Regel, in *Gartenflora*, 1880, t. 1307. *T. linifolia*, Hort. Burr haud Regel, in *Gartenflora*, t. 1235.

their native habitats, and how, with ordinary care, few plants are more tenacious of life under cultivation, in spite of all that has been said to the contrary. Mr. Kleinjung writes:—"It is a very strong plant, with ten spikes, carrying in all from ninety to one hundred flowers. It was imported to Germany by my late father amongst other plants about forty years ago. I cannot remember what flowers it ever had, but pieces of the plant brought here some fifteen years ago occasionally flowered partly as typical *Miltonia spectabilis* and partly as *M. Moreliana*. About six years ago I brought the remains of the plant (some four or five bulbs) here, and performed my first work in the Orchid fancy by placing it in a basket, with the result that the plant, although vigorously growing, never showed any inclination to bloom, until at last this year it came out with such success, and, to my astonishment, with flowers altogether different from those seen before, and from what I expected." A flower of the rare white *Odon toglossum* & *Galeottianum* also came at the same time

### VINE HOUSE, HASLINGDEN.

LANCASHIRE, Yorkshire, and Cheshire have, at least during the century which is fast waning, presented features of great interest to the horticultural community. The love of trees, shrubs, plants, and fruits steadily grows upon one's affections as years roll by. We see it exemplified wherever we go among those thriving hives of manufacturing industry. Beginning in small things, well-to-do people increase their expenditure in the objects of their choice, and from Roses and border flowers, greenhouses are built; and from Camellias, Azaleas, Pelargoniums, Fuchsias, and such-like, many amateurs drift into Orchid culture. Such has been the case with A. Warburton, Esq., Vine House, Haslingden, one of those gentlemen who has got together in a very short time one of the most promising collections of Orchids in the district in which he lives. He has also grown Peaches and Nectarines to great perfection, the trees showing exuberant health, with branches well thinned out, and carrying a fine crop of fruit, which give every appearance of fruiting well. Royal George and Noblesse Peaches, with the Elruge Nectarine, are the staple trees; and in the vinery Black Hamburgh is the principal variety of Grape. Climbing Roses have also a house to themselves planted out, and bearing large crops of fine flowers. Climbing Niphetos is strong and good, and others, such as Gloire de Dijon, crop well.

There are eight houses for Orchid culture of various sizes, the most modern being a *Cattleya* and *Odontoglossum*-house, then a *Cypripedium*-house, two *Dendrobium*-houses, a *Laelia purpurata*-house, in which is the collection of *Lycastes*; a Mexican-house, where promiscuous plants are grown; and an *Odontoglossum Rossi*-house, where other oddities dwell.

The collection of *Cattleyas* is a very choice one, grown in a span-roof house with a passage up the centre, and a 3½-foot table on either side. It measures 35 by 10 feet with sides 4½ to the eaves, and the angle of roof about 35°. It is fitted, like its neighbour, the *Odontoglossum*-house, with lath blinds, kept from the roof, 10 to 12 inches, by T-galvanised iron-rods, and the ridge raised at the extremity, so that when the blinds are rolled up, they are on a level with the ropes and pulleys. Nothing could work easier and better, and the eclipsed sunlight evidently benefits the plants, and makes the atmosphere pleasant for general inspection.

Among the finest of the *Cattleyas* in flower we specially noted one called *C. Mossie bellissima*. The plant had six of its extra-quality flowers, which are of pure white, sepals and petals of unusual formation, the lip being white, slightly flushed at the extremity and the base, under the lobes, and running up to column-base, decorated with orange lines. The lip is a little narrow, but, taking it all in all, it is a superb flower. Another of similar brood is called *M. Caluzac*, a form very like *C. Mossie Lady Wigan*, with white sepals

and petals, the petals a little narrower than in a good typical flower. The lip is expansive, and has deep orange rays on the base under the lobes, running up to column. The central portion has rayed carmine lines, running out and stopping short. of a flesh-white margin. *C. Mossie Vanneriana* is also white, probably whiter than the other two described, but wanting in size of flower, and flushed on the epichilium. These white *Cattleyas* are certainly lovely. A grand plant, showing nine blooms, of *Cattleya Wagneri* will soon expand. It is without doubt when in good form the Queen of the *Mossie* tribe, as Mendeli Blunti is the Queen of all white *Cattleyas*. *C. Mossie aurantiaca* is of splendid formation, and its deep blotched orange base, with its fine lined pinkish lip, tells well against the blush segments. *C. Mossie*, Howick House variety and Stamford House variety, are notable among many excellent coloured ones—all in flower. *C. M. Heineckiana* is a good variety, and growing well here. *C. Warszewiczii delicata* is a charming subject of the Trianaei section, with its grand pale blush segments and finely-formed blush lip. *C. Trianaei Backhouseiana*, *C. Schroderi*, in many varieties, crossed the eye. Some particularly good *C. Mendeli* were doing admirably, notably Miss Little and May Queen. *C. speciosissima Ernesti*, *C. x Canhamiana*, lots of *C. Lawrenceana*. Chief among *Laelias* we must give the palm to *L. elegans* Kathleen, described at p. 580, col. B.; *L. purpurata* Empress is an excellently-formed flower, remarkable for its deep blackish-purple lip, with a whitish mark on centre of the lower portion of lip; *L. purpurata Hardyana* is a very good flower of pure white segments, above the average in form, with a deep-coloured lip like Empress but not generally its equal—in fine flower here. A very notable one with four flowers had also white segments, a little narrow, but as white as paper, and the lip large and also of deep purple, with a white central blotch and a beautiful white-banded margin round its whole. This Mr. Warburton calls *L. p. excellens*. The vigour of the whole was very pronounced, and there were no common sorts in the collection, barring a few of the old *C. labiata* which have not yet flowered.

The *Odontoglossum*-house contains many grand varieties of *O. crispum*, and a whole importation of the best Pacho type, out of which already have sprung some choice varieties. The large, dark bulbs and the colour of the foliage, which rustles to the touch like a piece of silk, betoken uncommon vigour. In such a large lot as this, out of which have sprung some startling forms, expectation runs naturally high as to the lot yet unflowered. One grand variety of *O. Harryanum* we noticed—pity that such a distinct species does not present a better front—not so crumpled to the spectator. *O. Pescatorei* is as quaintly-looking, and is doing well. *O. Wilkeanum* catches the eye, and so does *O. Lucienianum*, a natural hybrid of the *navium* type; *O. Reichenhami* contrasts well in its weird-like colours among those above-named. *Oncidium macranthum* revels here, and so do *Sophrontis grandiflora* and some *Masdevallias*. Plenty of ventilation properly provided ensures a particularly pleasing atmosphere.

Ascending to the high grounds above the arch of the substantially-built stone villa, we first enter the *Cypripedium*-house, in which some other species are accommodated. The most prominent among the Slipper-Orchids were *Laura Kimball*, a very rare plant of the insigne form, said to be a yellow one. It is a good grower, and ranks alongside of insigne *Sanderia*, although the former is a much more valuable plant. *C. Plenum superbum* (*Lawrenceanum*) *Hyeannum*, a fine shade of yellowish-green; *C. x Statterianum*, a little too crumpled in dorsal sepal, but with fine colours; *C. x Lucienianum superbum*, rather under than over rated; *C. bellatulum* and *bellatulum album*, which is really a gem, and a good grower too, so far as we can observe. A very pretty-coloured form of *C. Exul* was in flower, golden-yellow, with the dorsal sepal white, and spotted towards the top, one of the best we have seen; then *C. Leeannum giganteum* in quantity; *C. x Burtoni*, *C. x Gowerianum*, like *Lawrenceanum* in colour and form, but much finer in every way; *C. x Eyanor*,

*C. x Curtisii magnificum*, *C. x grande atratum*, a grand grower, and a stylish flower, with attenuated petals; *C. Ashburtoni elegans*, which has a very prominent dorsal sepal with dark-coloured lip.

*Dendrobiums* are grown in two houses—a portion of the smaller and rarer ones in the *Cypripedium*-house, which is span-roofed, and another portion in a lean-to house, or rather a span-roof cut in the middle by a central glass division, which separates the vinery from the *Dendrobium*-house proper. The collection of *D. Wardianum* here is an excellent one, which was rested too long for a crop of flowers in the back-end, but great vigour is now showing in the various specimens. One particularly fine one—the finest, according to Mr. McFarlane's note, which I read, that this artist has yet painted, has extraordinary brilliant blotches on the segments, going as far down the limbs as in *D. nobile nobilium*, and coloured right through the body of the flowers. It is called *Wardianum nobilium*. It has sprung from one of the recent importations, and is a valuable individual. The best of the race is grown here, comprising the best of the nobile section, which, in its finer varieties, still holds its own, and of which there are about twenty distinct forms, including *nobilium*; then *D. splendidissimum grandiflorum* Stand Hall var., and *D. x s. illustre*; *D. x Juno*, a lovely thing, *par excellence* in form; the white *D. n. Amesiae*, *D. x Rolfeae*, and the founding, which must have been a cross in its native country; *D. Rolfeae roseum*, a charming little flower. *D. x Luna* is one of the most distinct, and one of the most beautiful of the pale-faced section, with very prominent spoon-shaped lip. *D. x Desdemona* is also fine—an improved *Leechianum*; *D. x Cybele nobilium*; *D. Backhouseianum superbum*—the most brilliant of the blotched forms, darker at back of segments than front; and a whole host of others, which we have no space to describe, unless we note excellently-grown plants of *D. x Venus*, and *D. Falconeri x D. F. giganteum*.

The two oldest houses, formerly tenanted with greenhouse plants, and several other miscellaneous things, is still doing duty in that way, with the roofs used for suspending the collection of Mexican *Laelias*. The *L. anceps Williamsii* and *Dawsoni* are among the best of the whites, and among the reds *L. anceps Chamberlainiana* and *L. a. Schroderi* are the most vivid. They are both evidently excellent growers, doing none the worse for the extra moisture evaporating from the wealth of foliage below. *Oncidium Marshallianum* is doing well in this climate, having flowered in some instances with great branching panicles. It is a large lofty house, in which, notwithstanding the heat, *Maréchal Niel Rose* has given off a great crop of blooms.

In the adjoining house is a collection of unspotted *Laelia purpurata*, and several great pieces of *Cattleya gigas*, which grows rampantly, without showing any disposition to flower. There are several *Dendrobies* grown here, *D. Hildebrandtii*, with its twisted segments, being notable, especially the white form. *Lycastes* of the Skinneri order do well in this climate. One of the best Howick House varieties of *S. alba* has grown into wonderful-sized pseudo bulbs, remarkable for their flat, ovate, and oblong outline; this indicates proper treatment, and brings flowers of great size and powers of endurance. The darker forms are well represented in *L. s. imperator*. *Miltonia vexillaria* was flowering in abundance; it looks best in the plant, as when cut the flowers are too fugacious.

The *Odontoglossum Rossi*-house is in juxtaposition, and is a small lean-to where foliage is within comfortable distance of the glass, and the plants repay the grower with abundance of bloom.

### LELIA PURPURATA VAR. ASHWORTHIANA.

This is a variety of great distinction, a complete departure, in point of colour, from all others in cultivation. The sepals are white; the petals are highly-coloured, like the lip itself, and renders the flower most striking. The main colouring is flamed-purple, as brilliant in the back of the petals as the front, standing out in prominent venation lines placed on a blush ground. The lip is crimson-purple, exquisitely illumined, and showing little or none of

the pale blotch on the central extremity. The colouring runs up in radiating lines towards the convex column. In the concavity of the column are four parallel rosy-purple lines stopping short at the lip of the column, being yellowish-white. The only defect in the flower is that the petals nod onwards towards the folded-in lobes of the labellum, somewhat as in some of the forms of *Cattleya Mendeli*. The substance and colouring are altogether without exception. The variety is dedicated to that enter-

TULIPA BATALINI, REGEL.

PROFESSOR BATALIN'S Tulip was originally described and figured by our old friend Dr. Von Regel, in the *Gartenflora*, 1889, t. 1307. It is a native of Eastern Bokhara, and has pale lemon-yellow flowers. The perianth segments and yellow stamens are glabrous at the base, and the outer flower-segments are destitute of a spot at the base. The bulb (scales which we have not seen) are described as woolly on the inner

of all, has an area of about 8000 square metres, whilst the other, arranged by Mr. Goerms, may be about 3000 square metres. The ground plan of each is different. Mr. Goerms has selected a regular form, whilst Mr. Buntzel chose an irregular ground-plan. In both cases the situation decided the shape. Mr. Buntzel has a great many large and small beds distributed about in the turf, through which run curved paths. The beds are planted partly with standard, partly with root-grafted Roses, partly with cuttings of plants. Of each class are many representatives. The total number of the plants is unknown, even to the exhibitor; certainly there are not fewer than 12,000 to 15,000 plants, and I had the opportunity of seeing, when this rosary was planted, van after van bringing the plants, and when they were unpacked it seemed as if there was no end to them. The exhibitor was quite amazed to see how many plants were necessary to fill the beds. When in full flower, this rosary will have a fine effect. But by no means less delightful will be the rosary of Mr. Goerms, who has about 6000 standards of about 600 sorts. This rosary is especially interesting to rosarians. The plants are very strong, prepared for the exhibition during some years, and certainly will flower perpetually. They are planted like those of Mr. Buntzel this spring, but both are now well-established.

Mr. Buntzel's rosary is bounded on one side by a park laid out by Mr. Kranitzki, which has a triangular form. The two other sides of this are broad walks. The boundary to Mr. Buntzel's is formed by Mr. Kranitzki's espaliers of Peaches, Apricots, Apples and Pears. They have not such a regular form as those of Mr. Spaeth, but they have good fruit-stems, and show that it is by no means necessary to prune an espalier precisely as the rules prescribe. This is of importance to all those amateurs who have in their cottage garden some espaliers, and are obliged to prune the plants themselves. Mr. Kranitzki's most interesting exhibits are his Conifers. They are so densely grown, and so faultless; at the same time of such vigour and good shape, that they are among the best Couifers exhibited. Herbaceous plants are now fashionable here, and so it is not to be wondered at that we find them here. But there are no species of especial interest. On the other side of the broad walk which bounds Mr. Buntzel's and Mr. Kranitzki's garden are situated other gardens; Mr. Lorberg's is especially distinguished by delightful Conifers. Mr. Lorberg has also some very well-trained fruit-trees in the form of Palms, cup-shaped trees, pyramids, &c., all of which are well-furnished with bearing branches. The neighbouring garden is that of Mr. Wredow, which has made use of old standard trees.

It is difficult to give an idea of a little cottage garden without a ground-plan. The garden is laid out to form a landscape, and has a good effect, but the little pond is not beautiful. It is, unfortunately, a rule with a good many landscape gardeners, that a garden must have a pond. Such gardeners construct shapes which they never have seen in Nature, or at least only on a much larger scale. Such a pond is this. I can imagine that a tank a thousand times larger than this, with the same features, would give a fine effect. But there is a difference between a little pond of some square metres and a tank of some hectares in area.

On the opening day, there were some good collections of Cyclamen. When I sent in February cut flowers of Cyclamen to the Royal Horticultural Society, I was somewhat astonished to hear that they could not rival the English ones. I have very much to thank Messrs. Sutton & Sons, who were kind enough to send me a collection of their Cyclamens. I showed them to our specialists. Indeed, there were some colours amongst Messrs. Sutton & Sons' Cyclamens which are wanting with us. There are two or three varieties which equal ours, but the fact is that our German varieties are by no means inferior to the English, since of a good many varieties, we have much stronger plants, with much larger flowers. The flower-stalks are twice as strong as those of the English varieties. In one point the English growers

FIG. 131.—TULIPA BATALINI (REGEL): FLOWERS PALE LEMON-YELLOW.

prising amateur in the north of England, Mr. Elijah Ashworth, of Harefield Hall, Wilmslow, who obtained it from one of the importations of Messrs. Cowan & Co., of Garston, Liverpool.

The whole place is in an excellent state of keeping, as Mr. Warburton does not grudge any reasonable expense to have his plants in first-rate order. "That I am determined to have," says he, "and I will have it too." He is excellently fitted with a head gardener in Mr. J. Lofthouse, and many evenings are spent with him and his staff in a room set apart for reading and discussion, in which the genial proprietor cordially joins in those subjects in which their everyday routine is engaged. J. A.

surface, and the leaves are linear-lanceolate. It is an early-flowering, very refined-looking Tulip. Our illustration (fig. 131) was taken from a specimen exhibited at one of the recent meetings of the Royal Horticultural Society by Messrs. Barr & Sons.

FOREIGN CORRESPONDENCE.

HORTICULTURE AT THE BERLIN INDUSTRIAL EXHIBITION.

In my first report I mentioned Mr. Spaeth's rosary. In addition to this there are also two other rosaries. The one arranged by Mr. Buntzel, and the largest

surpass the German ones—they cultivate more varieties of colour. The German public until now has taken but little interest in the different varieties of colour. They like those plants which form a large bush of well-spotted leaves, and from which rise a good many large flowers on straggling stalks, about 4 inches above the leaves. A plant of 16 to 20 inches in diameter, the leaves all of the same height, not more than 4 inches above the pot, a cluster of about fifty flowers open at the same time, all the same height; such are our good market plants, which are priced at 8s. to 10s. the piece in the flower-shops. Whether the colour of the flowers is a little more or less red, or purplish, &c., makes no difference. Other objects of interest were cut Carnations, ranging from pure white to dark brown, ten of which says the grower, Mr. Studier, Gross Lichterfelde, are new varieties grown by himself. I was much pleased with them when I saw them.

When I said above that our public took but little interest in the colours of Cyclamen, I must confess that it is not so with *Azalea indica*, of which there was a very fine exhibition from the well-known *Azalea*-grower, Mr. Bluth, Steylitz. *Azaleas* are an instructive example of the theory that the public taste is guided by the middlemen. Mr. Bluth had exhibited some specimens of *Apollou*. The public was enthusiastic, as it never before saw such a colour in an *Azalea*. Curiously enough, said Mr. Bluth, the middlemen do not buy this sort; they say the public does not like it.

To-day only one other object of interest can be mentioned. Apples, already a year and a half old (part of the 1894 crop), and still as fresh as if gathered yesterday from the tree. It is a good medium-sized yellow sort, without a name—a seedling, the exhibitor says. *U. D.*

#### RAPID GROWTH IN ADIANTUM FARLEYENSE.

Enclosed I send a photograph of a plant of *Adiantum Farleyense*, which perhaps may be of interest, illustrating, as it does, the rapid growth of *A. Farleyense* here in Greece. In October, 1894, the plant shown in the photograph was a small plant, consisting of a single crown, bearing two small fronds, and was in a 3-inch pot; and when the photograph was taken the latter end of March this year, the plant was in a basket 18 inches square, was 2 feet 8 inches high, and 3 feet 3 inches in diameter. It has been grown suspended from the roof of a stove, where the thermometer often rises to 95° during the summer with all the ventilators open. The house is shaded from the sun during the hottest part of the day by means of blinds. Of course, a good supply of atmospheric moisture is maintained. The compost I use for *A. Farleyense* consists of two parts Heath-soil, as it is called here, one part leaf-mould, with a good sprinkling of sand. The *Erica* soil is collected by the shepherds on the mountains, and consists chiefly of the decayed leaves and flowers of the wild *Erica*. The leaf-mould I get from the Oak woods in the south of Greece, and it has to be brought all the way by sea. This compost seems to suit *A. Farleyense*, which grows like a weed in it, plants divided up in March or April growing to a large size by the following October. I find it is not advisable to disturb the plants after the month of April, or they are liable to remain stationary during the great heat of the summer. If not done in April, I have found it best to leave them till September, when division of the plants may be undertaken, and good plants obtained the following May. *Thos. Honey, Gardener to M. A. J. Vouros, Rav. Kifissia, Athens.*

## CULTURAL MEMORANDA.

THERE are many cultivators who do nothing to their Gooseberry and Currant bushes and espaliers the whole year round beyond affording them a winter's pruning. This is mistaken practice, as it also is with the Rose; and far finer fruit, and more of it, is obtainable if from the beginning of June to the middle of July the suckers from the roots are cut away by

degrees, so that they shall not choke up the plants with unfruitful wood, hindering the ripening of the future bearing shoots, besides rendering the gathering of the berries very unpleasant work. In July these shoots should be topped. At the same time all the one-year shoots, as may be required, should be served in the same manner from time to time; and where they are crowded, light and air should be let into the crown by removing some of them, so that the buds may properly develop. These are points in the cultivation of cordons which cannot be neglected without loss of crop and other obvious evils.

## THE WEEK'S WORK.

### THE ORCHID HOUSES.

By W. H. WAITE, Orchid Grower, Burford, Dorset.

#### HINTS ON PRESENT NEEDS OF THE PLANTS.—

Up to the present time the weather has been very favourable to the welfare of most Orchids, especially those of the tropics, which occupy our warmest houses. *Dendrobium*, *Cyrtopodium*, *Catasetum*, *Cycnoches*, deciduous *Calanthes*, *Schomburgkias*, *Renana*, *Lissochilus*, &c.; all seem to delight in this unwonted amount of sunheat. While the shade-loving plants, such as *Cypripedium*, *Phaleopsis*, *Platyclinis*, *Phaius*, *Cirrhopetalum*, *Bulbophyllum*, *Angreum*, &c., show by their vigorous growth that they appreciate the warmth and the moisture afforded them. Plenty of water is essential to all of these plants that require a stove heat, particularly *Dendrobiums*, because, if these are allowed to become in the least dry at the root, the young shoots get a check that may end in their finishing up prematurely for the season with the evil of a commencement of growth that would be sure to bloom unsatisfactorily. *Dendrobium Bensone*, *D. B. xanthina*, and *D. B. album*, now going out of flower, and with the young breaks when only a few inches high, pushing roots, should be forthwith repotted. In the performance of the repotting much care must be bestowed so that no roots get injured, as the welfare of the next flowering bulb depends, in a very great measure, upon these roots. Use small shallow pans for suspending, filling them rather more than three-quarters of their depth with drainage materials, and over these place a thin layer of peat and moss. For cultural directions see *D. Phaleopsis*, p. 677. From the present time until growth is completed this plant must be carefully and frequently inspected for any signs of red-spider or of mealy-bug, both of which are capable of causing much injury to the plant, and which must be kept in check by brush and sponge. The autumn-flowering *D. formosum* should be grown under similar conditions to *D. Bensone*.

**AÉRIDES.**—Many of the *Aérides*, viz., *A. virens*, *A. suavisimum*, *A. Larpentei*, *A. Lobbiani*, *A. crispum*, *A. expansum*, *A. Fieldingii*, *Saccolabium guttatum*, *S. giganteum*, *S. Blumei*, *S. curvifolium*, *S. anpulaceum*, *S. minutum*, and *S. retusum* now going out of flower, should be encouraged to make quick growth, removing the top-dressing if it be discoloured, and putting fresh sphagnum-moss in its place. Other warm-growing plants which have recently been in bloom, as *Epidendrum bicoloratum*, *E. atropurpureum* *Randii*, *E. Mooreanum*, *Cattleya Schilleriana*, &c., should be rested in a sunny house, with a somewhat lower temperature than that they have hitherto occupied, returning the plants to their growing quarters immediately growth re-commences.

**HABENARIA MILITARIS.**—*H. carnea* and its variety *nivosa* now freely growing, will require much water at the root until such time as the flower-buds open, when the quantity should be gradually reduced. These plants should be kept quite free from insects that damage their beautiful foliage in a very short space of time.

**CATLEYA ELBORADO.**—Where grown sufficiently strong, this plant will now push up its flower sheaths, and, till the flowers open, the humid East Indian-house will suit them, provided water be afforded whenever the compost gets quite dry; but for the present keep the plants shaded from strong sunshine. The new pseudo-bulbs may be ripened after the flowers have faded. Another species which luxuriates under similar conditions to *C. Eldorado* is the tall-growing *Cattleya bicolor*. It is of consequence that an equable temperature be maintained in this division during the period the plants are growing. Although the nights may become warmer, heat ought not to be dispensed with alto-

gether, as by its use stagnant air is got rid of. Coolness, with moisture during the night, will often cause spotting of the foliage of *Phaleopsis*, *Dendrobiums*, and *Calanthes*. A small amount of ventilation at the apex of the roof afforded the last thing at night will assist circulation of the air, and thus get rid of much of the moisture that accumulates after the house is closed. Let fire-heat be used to maintain a temperature of 75°, and when finishing up at night, manipulate the damper so that the thermometer will stand at about 70° in the early morning.

### THE HARDY FRUIT GARDEN.

By G. WOODGATE, Gardener, Rolleston Hall, Burton-on-Trent.

**SUMMER PRUNING.**—From the middle of June to the middle of July is considered the best time for what is termed the summer pruning of most kinds of fruit trees, and if this be carried out judiciously, very little pruning will be required in the winter. The fact should be remembered that as winter pruning encourages wood growths, summer pruning conduces to the formation of fruit-spurs and bloom-buds. Before commencing to prune, the gardener should clearly understand the varied nature of the growths, which spring from the main branches of a tree or bush. These are generally of three kinds, and usually understood, as first "shoot spurs" about 1 inch long, having a prominent bud in the centre, and surrounded by a whorl of five or six leaves; second, "long spurs" very similar to the first, but averaging from 3 to 6 inches long. These are fruit spurs, and should not be pruned. The third kind of shoots, are those which are termed wood growths, having a pointed bud in the centre, and varying from 9 to 15 inches in length, and these should be cut back to about the sixth leaf from their base. One or more young growths will soon push out from the terminal buds of such shoots, which should be allowed to extend themselves till early in the month of September, at which time they should be pinched back to one leaf. By following out this method intelligently, light and air will be able to reach the two or three buds left at the base of the original shoot, and assist their development as fruit buds. The leading or extending shoots will not require such close pruning, but should be left from 1 foot to 15 inches in length, according to the area to be covered. Those trees which are the most forward in growth, should be the first to receive attention in the matter of pruning. There are a few varieties of Apples which produce their fruit at the ends of the preceding season's growth, as *Early Margaret*, *Irish Peach*, *Golden Noble*, *Ashmead's Kernel*, *Yorkshire Beauty*, *Cornish Gilliflower*, and some others, and such shoots should not be pruned or stopped, but if the growths are in the least degree crowded together, a few of the worst placed ones should be removed.

**STRAWBERRIES.**—The preparation of the ground for new plantations should now be undertaken. It will be well to afford it a heavy dressing of rich farmyard manure; and trench it two spits in depth, if it is land that will bear deep digging without deterioration. To obtain crops of fine fruits the following year, it is necessary to set out strong plants, which can be obtained by layering stout runners in small pots as soon as they are obtainable, so as to have them ready for planting out early in the month of August. If the soil of the garden is not the best for Strawberries, it is good practice to make new beds every two or three years, and do away with the old ones. Where this is done the runners may be planted closer together than usual; where the beds last in a good condition for a longer period of time, 15 inches between the plants, and 18 inches between the rows being sufficient space. I append a list of twelve varieties that do well in this neighbourhood, early: *Royal Sovereign*, *Noble*, *Vicomtesse Hélicart du Thury*, *John Ruskin*; mid-season: *Sir Joseph Paxton*, *President*, *James Veitch*, *Sir Charles Napier*; late: *Loxford Hall Seedling*, *Latest of All*, *Hélène Glade*, and *Waterloo*. But as some varieties do better in different localities than others, no list can be given that will suit every garden. A gardener should try several of the well-known trusty varieties, and select those that thrive best in the soil of his garden.

### THE FLOWER GARDEN.

By HEDLEY WARREN, Gardener, Aston Clinton, Tring.

**PLANTS FOR SPRING BEDDING.**—Now that the pressure of the work in bedding-out has slackened in most gardens, attention must be turned to the propagation of the plants needed for the display next spring. Seeds should be sown without delay of

Myosotis in variety, Wallflowers, Daisies, Pansies, Aubrietias, Alyssum maritimum, Canterbury Bells, Lunaria biennis, Honesty, &c. Plants which may be increased by division, and some of those above-named are amongst such, may now be divided, planting the bits in a partially-shaded piece of ground in lines about 1 foot apart, and from 6 to 9 inches from plant to plant. The ground should be in good heart, but not over-rich, and a dressing of new loam will be beneficial to the plants. Thoroughly water in the plants, and continue to afford water as needed till they become established. Cuttings of Wallflowers, &c., should be struck in sandy soil under a hand-glass or cold frame, and be kept close till signs of growth are noted.

**ANNUALS.**—Sowings may still be made for late display, but especial care will be needed in watering, thinning, &c. Earlier sowings should be thinned before the seedlings get in the least degree crowded together, or their season of flowering will be brief.

**Summer Bedding.**—Most of the kind of plants which remain may be advantageously made use of in filling up vacant spots at the margins of shrubberies and in the flower borders, also for purposes of propagation in late summer. This applies to the ordinary half-tender plants still commonly used for filling the summer beds. Verbenas, Ivy-leaved Pelargoniums, Petunias, and plants which are usually of the like growth, pegged down when the beds are of small size, should now receive attention, the soil being previously mulched with cocoa-nut-fibre refuse to give them a finished appearance and retain moisture, thus promoting healthy and rapid growth, and abundant blooming.

**CLIMBERS.**—These plants will now call for weekly attention, if tidiness and neatness are looked for, although this side of their culture may be overdone. The species and varieties of Clematis especially call for close attention in this respect. Climbing Roses should have the long shoots loosely secured, and afterwards be syringed with soapsuds, and finally with clear water. Plants which grow near to buildings where the rain does not reach the roots should be copiously watered at the root, and overhead occasionally. Sweet Peas, single and double-flowered Convolvulus, and Tropaeolum aduncum, will need to be supported with light spray before the growths become entangled. These last-named plants should be employed in the rockery and wild garden, where they look the best if allowed to grow unrestrained.

**ROSA RUGOSA** is a species which has a handsome appearance on a lawn, or at salient corners. There is at the present time a splendid specimen of this Rose on the lawn at Drayton Rectory, the residence of the late Rev. Harpur Crewe, which is about 1 mile from Aston Clinton, which was planted by him. Rosa rugosa being a perfectly hardy species, thriving in almost any kind of soil and position, should find a place in every garden of any pretensions.

**VIOLETS.**—Plants in beds which have been made up for flowering next season should have all runners removed as soon as observed, the soil kept free from weeds, copiously watered in dry weather, affording the beds an occasional stirring with the Dutch-hoe.

**CARNATIONS.**—Preparations for layering Carnations should now be made. As materials in which to layer may be named finely-sifted garden refuse, which has undergone charring, old mortar, road-grit, and sharp sand, which should be mixed with some light earth and potting-bench refuse mould. Throw these into a heap and well incorporate by turning the heap several times before using, it will be in much better condition for layering than if mixed when it is made use of. In view of the prevalent hot dry weather, this heap should be once watered—at, say, the first turning.

**FRUITS UNDER GLASS.**

By W. FORD, Gardener, Highclere Castle, Newbery.

**MELONS.**—The plants for furnishing fruit late in the month of August and later should now be planted. Afford them a firm rich soil, and shade them slightly for a day or two, in case the weather should be bright, maintaining humidity in the frame or pit by an occasional sprinkling, and closing the lights by 3 P.M. Where later Melons have to be grown on dung-beds, seeds should be sown forthwith; and in the case of water-heated houses and pits, sowing should not be long delayed. Sow three seeds in a 4-inch pot, and select the strongest plant when they are in the first rough leaf. One plant will suffice for a light of ordinary size,

planting it in the middle, the growing point being pinched out as soon as two of the true leaves have developed, which will cause several laterals to sprout, which should be reduced to four, two being trained forwards and two backwards. The after-formed laterals should be reduced in number, so as not to have any crowding in the frame, but good stout foliage. Endeavour to have a crop of fruits set at about one time. As soon as the flowers begin to open, the frame should be kept dryer, and less moisture should be afforded at the root, but no flagging should take place. Leave air on at night at this stage, the better to secure good fertilisation of the blooms. As a late variety, none is better than Monarch, a green-fleshed Melon, of desirable size, which can be kept longer in good condition after being cut than any variety I am acquainted with. Pay close attention to the tying, stopping, &c., of the earlier Melon-plants, and afford ripening fruit a free circulation of air always, also abundant sun-light.

**FIGS,** except where a crop of fruits is ripening, may be freely syringed every day at closing time. Afford the plants manure, so that the second crop may swell off satisfactorily. The fruits should be freely thinned, reserving the largest fruits, found usually near the base of the shoots. New mulchings of rotten manure should be placed over the roots, and the growths trained in thinly, so that firm, well-ripened wood be secured. Where fruit is ripening air must be freely admitted, even if fire-heat has to be used in dull weather. Young trees growing in pots that are intended for early forcing should be kept near the glass, where they will make stout, sturdy growth, liquid-manure being afforded two or three times a week, with daily syringings of the foliage. As soon as growth is finished for the season, afford more air; and when the shoots are matured, stand the plant in a warm sunny corner out-of-doors for a few weeks, protecting them from heavy rains. In cool-houses or on glass-covered walls, the growths on Figs should be well thinned, and a mulch of short manure and copious waterings of liquid-manure applied to the roots, if the borders are small. Close such structures early in the afternoon, and syringe the trees once or twice daily.

**PLANTS UNDER GLASS.**

By JNO. McSTYRE, Gardener, Woodside, Darlington.

**HIPPEASTRUMS.**—The latest seedlings will have filled with roots the thumb-pots in which the first potting was made, and they ought now to be shifted into 4-inch ones. A very suitable kind of compost for them at this stage consists of loam two-thirds, well-rotted manure, part of which may be dried cowdung rubbed to a fine state, and sharp sea or pit sand. Let one-third of the bulb remain above the level of the soil, pot firmly, and place the seedlings in a Pine-pit or other warm place. Keep moist but not wet, and as the pots fill with roots increase the amount of root-waterings, and if the drainage be good they will make rapid progress. Flowering bulbs and those of nearly flowering age, if finishing their growth for the year, may be placed in a house or pit with a warmth midway between that of the stove and of the greenhouse, withholding water gradually as signs of ripening foliage indicate the lessened need for root-moisture.

**THE FERNERY** should now be looking its best, and during the warm days moisture in abundance should be afforded all of the plants which are well rooted, damping the stages, wall, rockery, paths, &c., several times a day. I do not approve of heavy overhead syringings, but the air of the house should be kept moist instead. If a quantity of plants from spores exist, those which are still in the store-pots, if potted up singly at this date may be relied upon to make little plants useful for a variety of purposes in the autumn and early winter. A number of small pots of Adiantum cuneatum and A. gracillimum if shifted into pots one size larger than those they are now occupying, and kept growing, will be valuable in the autumn months in furnishing vases, dinner-table decorations, &c. Some gardeners make the mistake of potting Ferns with too great firmness, hindering root and frond development, whereas a middle course should be aimed at. Some kinds of soil if pressed too firmly when moist become as hard as brick, which no roots are able to penetrate. A compost in which most Ferns do well, is sweet, well decayed leaf-mould, light loam, and hard peat, in equal ratio, to which is added a fair quantity of river or other sharp sand. In a soil of this description the Ferns make sturdy fronds, which last longer and have a finer effect.

**GREVILLEA ROBUSTA**—Seedling Grevilleas growing in thumb-pots should have a shift into 4-inch pots, a useful size for many decorative purposes, affording them a light kind of soil, and placing them in an unheated pit or frame on a bed of finely-sifted coal-ashes. Grevilleas do best in the shade.

**PRIMULA SINENSIS FIMBRATA.**—The earlier-raised plants, if sufficiently advanced may now go into their flowering-pots and stood wide apart in a cool frame. In the potting-soil charcoal should always be used, a few pieces of the size of horse-beans being placed round the neck of the plants to prevent their damping-off if afforded water in a careless manner. Shade the plants lightly in sunny weather.

**CINERARIAS.**—The early-raised plants will now be ready for pricking off from the seed-pans. Afford them a compost of leaf-mould a half, loam a quarter, spent Mushroom-bed materials a quarter, and a sprinkling of sharp sand, and grow them under as cool conditions as possible.

**WINTER-FLOWERING CARNATIONS.**—Those cuttings or layers rooted in the early spring, and now growing in 60's, should be re-potted into 48's, in which size the earliest of them may be flowered. Those intended for flowering at a later period may be shifted into 32's, large or small, when they have filled their present shift. Small matters must receive attention; the pots and crocks, for instance, must be quite clean and free from dirt, many failures occurring from the use of dirty pots; the loam should be rather strong and adhesive, and have been in stack for at the least six months. If the loam is of good quality, beyond mixing with it a liberal quantity of Thompson's Vine Manure when potting the plants, nothing else in the way of manure is required. After re-potting the plants, let the pots be sunk to the rims in a bed of some non-conducting materials during the summer months—leaf-soil forms a good bed for them at this season.

**THE KITCHEN GARDEN.**

By C. HERRIN, Gardener, Dropmore, Maidenhead.

**AUTUMNAL BROCCOLI.**—The recent showers have been very acceptable in the kitchen garden, enabling the planting of the early autumn Broccolis to be done with success. Good breadths of these useful varieties should be planted, especially of Veitch's Self-protecting, one which may be trusted to furnish heads about the time the latest Cauliflowers go out of season. If two plots of this variety be planted in succession, a few weeks apart, the supply of heads may be extended into the month of January, providing the frosts be of no great severity. Broccolis do best if an open situation be afforded them, and they should be planted out at from 2 feet to 2½ feet apart each way. A rich soil should not be selected for the beds, as the rank growth this induces tends to susceptibility to frost injuries, and what is required is sturdy, firm growth. The land should be made quite firm by being trodden all over.

**SAVOYS.**—Plants from the earliest sowings are now ready for planting, and this should be done before crowding takes place in the nurse or seed beds. If short-topped Potatoes have been planted at rather wide distances apart, Savoys may be interlined; otherwise the rows of plants should be 18 inches apart, and the plants 15 inches.

**CABBAGES.**—Some of the spring-sown Cabbages, if planted at this date, will come in usefully for early autumn consumption. Seed may be sown of the Rosette Colewort, a most useful kind for use in the early winter time; another sowing being made three weeks later. This is a very hardy Cabbage, and is not hurt by severe frosts. When planted 1 foot apart each way, this affords sufficient space for full development.

**CAULIFLOWERS.**—Batches of Eclipse, Autumn Giant, and Autumn Mammoth Cauliflowers will now be ready for planting on land heavily manured and made very firm. Plant them in shallow drills, 2 feet to 2½ feet apart. Cauliflowers from the autumn and spring sowings are now turning in; the variety selected—Snowball—is of delicate flavour, and the heads of a suitable size for the best table. These were ready from spring sowings ten days before we finished the latest Broccolis, that is, the first week in the present month. The quarters where Cauliflowers are turning in should be looked over daily, and a few of the leaves broken down over the curd as soon as it shows.

## EDITORIAL NOTICES.

## ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

## APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY,	JUNE 20	{ National Viola Soc.: Conference and Ex. at Regent's Park.
TUESDAY,	JUNE 23	{ Royal Horticultural Society's Committees.
WEDNESDAY,	JUNE 24	{ National Rose Society's Exhibition at Reading. Richmond Horticultural Society's Show.
THURSDAY,	JUNE 25	{ Hereford and West of England Rose & Horticultural Soc. Show. Peoples' Palace Horticultural Show (three days).
FRIDAY,	JUNE 26	{ Royal Botanic Society: Lecture.
SATURDAY,	JUNE 27	{ Windsor Rose and Horticultural Show. Canterbury Rose and Horticultural Show.

## SALE.

FRIDAY, JUNE 26 { Imported and Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK—62°.

Of all the means that were taken to celebrate the Jubilee of the QUEEN in 1887, none was more fruitful in good results than the establishment of charitable institutions—none, we may be sure, more grateful to the QUEEN herself. Among these we may, with some complacency, include the Gardeners' Orphan Fund. It was started by gardeners, it has been supported and maintained by gardeners, and it remains one of the most popular of garden institutions. It was carefully designed, and has been prudently and carefully managed. The annual dinner, which is taking place as these lines are passing through the press, is presided over by the Duke of BEDFORD, and we earnestly hope that a most successful celebration will take place. The Presidency of a Duke of BEDFORD is peculiarly appropriate. Within a quarter of a century Covent Garden Market, with which we are all more or less associated, has been nearly doubled in extent. A quarter of a century ago there was no Flower Market, there was no Floral Hall—at least, it was not dedicated to horticultural purposes; Tavistock Street was still Tavistock Street, and not a vegetable market, and there was none of the improvements which have added so much to the convenience of those whose business calls them to Covent Garden Market; and all these improvements we owe to the Dukes of BEDFORD.

During the same period we have seen scores and scores of agricultural experiment stations established in Germany, in France, in the United States—establishments designed with the view to promote the interests of scientific, and therefore, eventually, of commercial agriculture and horticulture. In this country we may count such institutions by units, and when we say that two of those have been in-

augurated within the last few years by the Duke of BEDFORD, it will be seen how large is the percentage due to that noble family. Under the auspices of the present Duke has been created an agricultural station working on the lines of the superlative establishment at Rothamsted; and even more recently a fruit farm has been established at Ridgmont from which we may look for the most important results in the scientific cultivation of fruit trees, and in the promotion of the commercial interests involved in the great industry of fruit culture.

In all these matters the Duke of BEDFORD is following the traditions of his house. Those of us who are familiar with the history of horticulture will recall with a glow of enthusiasm what was done at Woburn some sixty or seventy years ago. The Duke of BEDFORD of that period was an ardent horticulturist, and a most earnest supporter of the craft. What he did in support of DRUMMOND, CUMING, DOUGLAS, and other famous plant collectors, will never be fully known. His friendship with Sir WILLIAM HOOKER, LINDLEY, and BENTHAM, led him to use his potent influence to make Kew what it now is. The work was done quietly and unostentatiously, but how real it was may be gleaned from the writings of the authors we have named. Our library shelves bear witness also to the enlightened support that was given to horticulture. At Woburn there was a collection which is not surpassed in any private establishment even now. FORBES, his gardener, published a catalogue of plants growing at Woburn, which comprised no fewer than 6000 species. Where out of Kew is now such a collection of succulents as was then gathered together? Where is such a collection of Heaths? Unfortunately, these were afterwards dispersed, but the books published under the auspices of the sixth Duke remain, and will remain, standard books. We may allude, among others, to the *Pinetum Woburnense*, published by FORBES, with coloured plates, of which, unfortunately, only a hundred copies were printed; to the *Salicetum Woburnense*, an earlier work, of which even fewer copies were printed, but of which the descriptions and illustrations are so excellent that their value is unimpaired by the lapse of time. The *Hortus Ericaceus Woburnensis* was devoted to the description and illustration of a family now much neglected, but which has so many intrinsic merits that sooner or later it will come into fashion again. Another work published under the Duke's auspices was the famous *Hortus Gramineus Woburnensis*, prepared by SINCLAIR, and which, making allowance for the great strides made by chemical science, is still the most complete work on the subject.

We have said enough to illustrate the peculiar fitness of the present Duke of BEDFORD to occupy the Presidential chair of the Gardeners' Royal Orphan Fund, and we earnestly hope that the horticultural fraternity, mindful of their obligations, and of the bitter need of the orphans, will show their sense of the importance of the occasion, and do what in them lies to welcome their new President, and specially to help those who are debarred from helping themselves.

A GROUP OF PLANTS IN THE GARDENS OF DERRY ORMOND PARK, CARDIGANSHIRE.—Groups of stove and greenhouse plants have been frequently figured in these pages in recent years, the chief reason for their insertion being, in most cases, to show some peculiarity of arrangement, evidence of superior cultivation, and good taste shown in the disposition of the plants. We have no school

of art in gardening where a gardener can acquire a knowledge of the general principles that are applicable to a composition of this kind, as for instance such as are afforded the artists in oils and water-colours, or schools of design such as are open to aspirants in designing textile and ficile goods; but the gardener must follow his own ideas, if he have any, trusting to his innate powers of composition to produce something that will please others, even though it should fall short of his own conception, and fail to please himself. That he so often succeeds, and that, too, with materials often not the most suitable, is a matter for surprise. The group we depict in fig. 132 was set up by Mr. CRAWFORD, head gardener to W. INGLIS JONES, Esq., Derry Ormond Park, Cardiganshire, as an exhibition-object at a local horticultural show, and which took the 1st prize. The plants of which it consists are, as our readers will observe, inmates of the stove, and there are more foliage than flowering species; but as the former were doubtless selected for the brilliancy of their leaf-tints, the group would not be lacking in the desirable quality of colouring. There are many uses in a big mansion for such a group. It might be used to mask an empty fireplace, fill up a corner, close a corridor, block up an undesirable doorway, occupy a retired part of a landing on the chief flight of stairs, and be equally suitable in either.

THE GARDENERS' COMPANY.—The installation banquet of the Gardeners' Company took place on Monday night, 15th inst., at the Royal Institute of Painters in Water Colours, when the chair was occupied by the newly-elected master, Mr. N. N. SHERWOOD. The company included Miss Sherwood, Lord Amberst of Hackney, and the Hon. Alicia Amberst, General Sir William Olpherts, V.C., and Lady Olpherts, Sir Trevor and Lady Lawrence, Lieutenant-General Sir F. Norman and Lady Norman, Mr. Alderman Samuel (assistant), the Master Cutler, Mr. F. L. H. Collins, Mr. J. Hampton Hale and Mrs. Hale, the Rev. H. Curtis and Mrs. Curtis, Lieutenant-Colonel George Lambert (past master), Mr. Leedham Fuller and Mrs. Fuller, Mr. Nutting, Sir William Farmer (renter warden), Mr. E. F. Fitch (upper warden), the Rev. W. Wilks, Professor M'Hardy, Mr. Wotherspoon, and Mr. R. Goston-Salmond (the clerk). In proposing "The Worshipful Company of Gardeners," Lord Amberst of Hackney remarked that the charter of the company was very nearly 300 years old, but the company had been in existence longer than that. Gardening was certainly flourishing in the present day, as might be seen throughout the country. Sir Trevor Lawrence, in acknowledging the toast, stated that since the resuscitation of the company a few years ago they had done all they could to promote horticulture, and they would continue to do so. Other toasts followed, including that of "The Master," who presented the company, in commemoration of his election, with a handsome rose-water dish.

ROYAL HORTICULTURAL SOCIETY.—A meeting of the Fruit and Vegetable Committee was held in the gardens at Chiswick on Monday, June 15. Present: P. CROWLEY, Esq., in the chair; the Rev. W. Wilks, secretary; and Messrs. Balderson, A. H. Pearson, W. Pope, A. F. Barron, J. Wright, W. Bates, J. Smith, A. Dean, R. Fife, T. F. Rivers, and W. C. Cummins. Early Peas were first examined, the full trial requiring another visit later. Of dwarf first-early varieties, suited for pot culture or forcing, Sutton's Excelsior was awarded two marks; and of taller varieties of Marrowfat quality, the best was Fulton's Bountiful, which was awarded three marks. The committee agreed to include in next year's trial of new Peas a few older ones, to furnish standards of excellence. These are to be Chelsea Gem, William the First, early; Sharpe's Queen and Duke of Albany, second early; and Autocrat and No Plus Ultra, late. All varieties in wide cultivation. A trial of Turnips next claimed attention. These included early and late varieties. The best earlies were the white and the purple Extra Early Milan; and the Half-long white pointed variety, of excellent quality. These three were awarded three marks

FIG. 132.—GROUP OF PLANTS IN MR. INGLES JONES' GARDEN DERRY ORMOND PARK, CARDIGANSHIRE. (SEE P. 702.)

The late ones will be seen when ready for use. Strawberries proved to be more interesting material. There is an extensive trial of these fruits from last year's runners, which includes about fifty diversely-named varieties, old and new. Such varieties as Royal Sovereign, Leader, Monarch, and some others having recently been certificated were only briefly tested. First-class Certificateds were awarded to Countess, a great cropper; fruit of good size, loughish, of old pine quality, very rich in flavour, and of robust habit. To Edward Lefort, a very fine fruiter, colour rich, and flavour excellent; a great cropper, and free grower. Also to Augustine Boisselot; fruits long, pointed, rich colour and flavour. Three marks were given to the fine old President, here in such excellent condition; Princess Royal, a variety that showed high quality, and a good cropper; Acquisition, wonderful cropper and having fine handsome fruits, specially recommended for market culture; and Newton Seedling, very robust, later, an immense cropper, with fruits of considerable excellence. Martha Nicaise gave excellent flavour, but there was doubt as to its identity with General Dumorier, and it is to be grown against that variety next year. In spite of the drought, the plants had done well, and carried generally fine crops. On two-year-old plants of older varieties the crops are wonderful, in spite of the drought and absence of watering.

The next Fruit and Floral meeting of the Royal Horticultural Society will be held in the Drill Hall, James Street, Westminster, on Tuesday, June 23, from 1 to 5 P.M., when special prizes will be offered for hardy herbaceous flowers. At 3 o'clock a lecture will be delivered by Mr. SAMUEL HEATON, F.R.H.S., on "Gardeners—Past, Present, and Future."

**HORTICULTURAL LECTURER.**—We learn that Mr. J. H. WALKER, who was engaged by the Leicestershire County Council as Lecturer on Horticulture during the past four years, has been appointed to a similar post under the County Councils of Northamptonshire and Rutlandshire. Mr. WALKER leaves Leicestershire with the good wishes of many who have benefited by the instruction he has imparted.

**HORTICULTURAL CLUB.**—The usual monthly dinner and conversation took place on Tuesday evening, June 9, when there was a good attendance of members. Messrs. F. W. BURBIDGE, of Trinity College Botanic Gardens, Dublin, and Mr. MALCOLM DUNN, Dalkeith Gardens, were the special guests of the club on the occasion of their receiving the Veitch Memorial Medal. Mons. HENRI DE VILMORIN, the other recipient of the medal, was unable to attend on account of domestic affliction. This was a great disappointment to him and to the members of the club. The chair was occupied by Mr. HARRY J. VEITCH, and the health of the guests was proposed by the Secretary and the Chairman, and suitably acknowledged by both gentlemen. It was announced that the excursion would take place on July 30. It would be into Buckinghamshire, and Mr. LEOPOLD DE ROTHSCHILD had kindly invited the members to lunch at his beautiful place, Ascott, near Leighton Buzzard, and Mr. ALFRED DE ROTHSCHILD has also invited them to visit his place and have tea and light refreshment there in the evening. Mr. VEITCH has most kindly consented to superintend the arrangements.

**Ghent Royal and Agricultural Society.**—At the last meeting of the *Société Royale d'Agriculture et de Botanique de Gand*, the following awards were made:—Certificates of Merit: To M. L. DE SMET-DUVIVIER, for *Anthurium Scherzerianum* König Albert; to M. JULES HYE, for *Cypripedium Leysonianum*; and for *Miltonia vexillaria* Hycana (*à l'unanimité*), also (*par acclamation*), for *Laelia Cattleya Phœbe*; to Messrs. SANDER & Co. (*à l'unanimité*), for *Calamus Alberti* and for C. Carola; to M. le Marquis DE WAVRIN (*par acclamation*), for *Alocasia Gandavensis*; to M. E. PYNART-VAN GEERT for *Pteris Winssetti*. Also, to M. L. DE SMET-DUVIVIER, for *Cymbidium tigrinum*; to M. JULES HYE, for *Odontoglossum crispum* Meteor, and for *O. hystrix*.

To M. L. DE SMET-DUVIVIER, for *Anthurium Scherzerianum* nobile; to M. JULES HYE, for *Odontoglossum molus odoratum* (*à l'unanimité*), and for *Cattleya Mendeli* Duchess de Montrose; to M. L. DE SMET-DUVIVIER, for *Anthurium Scherzerianum* formosum; for *Laelia grandis tenebrosa*; and to M. JULES HYE, for *Miltonia vexillaria* Regina, and for *Cattleya Mossiae* Reineckiana, and for *Miltonia vexillaria* alba. To M. L. DE SMET-DUVIVIER, for *Laelia grandis tenebrosa* var. *Regina* (*par acclamation*); and to M. CH. VUYLSTEKE, for (two) species of *Oncidium*. Certificateds for Cultivation and Flowering were allotted to M. E. BEDINGHAUS, for *Leptospermum scoparium*; to M. G. DESAEGHER, for *Rhynchospermum jasminoides* (*par acclamation*); and (*par acclamation*), to M. JULES HYE, for *Odontoglossum vexillarium* purpureum. Certificateds for Flowering:—To M. E. BEDINGHAUS, for *Euphorbia splendens*; M. JANSSENS, for *Odontoglossum crispum*; and to M. E. PYNART-VAN GEERT, for *Crinum Powellii* roseum. The following obtained Honourable Mention.—M. OSC. WATTEGAMPS, for a seedling *Anthurium*; M. JULES DE COCK, for *Cattleya intermedia* var.; and M. JULES HYE, for *Odontoglossum vexillarium* virginale; for cultivation: M. E. BEDINGHAUS, for *Eurya japonica latifolia* fol. var.; and, for flowering: M. ALL. DALLIERE, for *Bilbergia macrantha*; and M. E. BEDINGHAUS, for *Rhynchospermum jasminoides*.

**THE JOURNAL OF THE KEW GUILD.**—Whether officially connected with Kew or not, we are all proud of the garden and of its staff, and with good reason. One of the happiest inspirations in connection with Kew was the formation, a few years ago, of the Kew Guild, a society founded for the purpose of cementing good fellowship and patriotism, if we may so use the word, between all those who are, or have been, connected with the work of the garden. "Old Kewites," as they like to call themselves, are distributed over the world, many of them filling responsible positions with such marked ability as to make us look forward in all confidence to splendid results as regards horticulture and botany, to say nothing of economic botany, which has greater powers of taking care of itself. Like all self-respecting societies, the Kew Guild publishes a journal, and we should not be much surprised if it also had an annual dinner. The number of the Journal for May, 1896, now before us, contains a notice of the career of the Assistant-Director, Dr. MORRIS, with an excellent portrait. Some notes follow on work carried out in the gardens during the year, as well as details concerning the appointments of Kew men to various botanic stations. The *Journal of the Kew Guild* will be an excellent medium for publishing the communications of these gentlemen, to whom we look for information on the indigenous plants, and their mode of life as a guide to their successful culture. There is too widely prevalent a feeling that the gardeners and botanists at home do not care to hear what is doing in the colonial gardens and similar establishments. It is really very much the reverse. We need not mention names, but it is a fact that an intimate friend and former correspondent of this journal went out to the colonies some twenty years ago, and from the time he went till the date of his death not a line was received from him, though he was exceptionally well placed for obtaining and forwarding information. May the Kew Guild get firmer grip of its associates! A portrait is given of Mr. GRANGER, who retired in 1893, and whose unvarying courtesy is gratefully remembered by those who had occasion to avail themselves of it. Indeed, the *Journal* is very interesting to all who have known Kew in the past as well as to those conversant with its present condition. Let those who want to know more of its contents than we have space to enumerate make themselves possessors of a copy.

**IV. SCIPION COCHET.**—The *Revue Horticole* announces the death of one of the leading Rosarians of France in the person of M. Scipion Cochet. M. Cochet was in his 63rd year, and had for many years taken a leading part in the publication of the *Journal des Roses*.

**THE LEGION OF HONOUR.**—M. BRUANT, of Poitiers, has been nominated a Chevalier of the Legion of Honour; M. SALLIER, of Neuilly, a Chevalier of the Order of the Mérite Agricole.

**NEW JAPANESE PÆONIES.**—Messrs. WALLACE of Colchester send us flowers of several varieties of great beauty. It is proposed to call them *Chrysanthemum*-flowered Pæonies, because the tufts of entangled ribbon-like stamens in the centre bear some likeness to the florets of some of the Japanese *Chrysanthemums*. Of those before us, "Mikado" is of a clear rich rose-colour; the stamens narrow, ribbon-like, twisted, yellow, with rose-pink stripes; the carpels green. It received an Award of Merit from the Royal Horticultural Society. In an unnamed seedling the colours are lighter pink, the stamens crinkled, cream-coloured, and the carpels deep rose. "Margaret Attwood" has snow-white petals, yellow stamens, and green carpels—a very beautiful flower, which has also received an Award of Merit.

**ROYAL CORNWALL AGRICULTURAL SHOW, PLYMOUTH.**—The chief feature in the large tent set apart for horticultural exhibits was the display made by Messrs. R. VEITCH & SONS, Royal Nurseries, Exeter, the collection being admitted to have been the best of its kind ever seen in the county. Many of the plants, such as the hardier species of Bamboo, viz., *Phyllostachys aurea*, *P. mitis*, *P. nigra*, *P. nitida*, and *P. viridiglaucens*, *Arundinaria nitida*, and *A. Hindsi* and *Thamnocalamus spathiflorus* being of special interest to owners of gardens in the warmer parts. The collection of plants was in other respects remarkable, and included many new and rare plants, besides a rockwork and garden plans.

**CHESHUNT, WORMLEY, AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.**—The usual fortnightly meeting of the society was held at Turnford on June 4. There was a good attendance of members, and Mr. JOHN GUY contributed an excellent paper on the subject of "Tomato growing for Market." After detailing the general routine of cultivation adopted in market nurseries, he emphasised the importance of regulating the supply, so as to have the largest quantities when prices ruled higher, that is May and June, this being the first crop. During July when prices are lowest, there should not be any to pick, and on the prices rising again, the second crop should be ready. He said that the variety grown by 75 per cent. of the market growers was *Chemin Rouge*, although some growers gave the preference to "Comet," which has proved itself to be freer from disease. At the close, considerable discussion arose as to the relative merits of these two varieties, also on diseases of green-spot, mildew, &c., and special attention was given to pot-culture of the Tomato. A hearty vote of thanks for his instructive paper was accorded Mr. GUY on the motion of Mr. F. S. HUTCHASON, seconded by Mr. W. HARRISON. At the next meeting, to be held on June 18, Mr. F. S. HUTCHASON will deliver a lecture on "The Life History and Metamorphosis of a Root-gall Nematode."

**THE KEW GUIDE.**—The Director of the Royal Gardens, Kew, writes:—"I am particularly anxious to make out a complete set for the Kew library of the various editions of the *Official Guide to the Royal Botanic Gardens and Arboretum*. We have no copy of the following editions:—1, 3, 4, 5, 6, 7, 9, 11, 12, 16, 17, 18, 20. Of those marked with an asterisk no copy is known to exist in any public library. I should be very grateful to any reader of the *Gardeners' Chronicle* who would put me in the way of acquiring any of these editions either by gift or purchase. *W. T. Thistleton-Dyer, Kew.*"

**A USE FOR EURRS: PAPER FLOWERS.**—Where real blossoms are scarce, flowers made of paper are often used as substitutes. The latest variety of these is made of scarlet crinkled paper in the likeness of a Poppy, and attached at the bottom of the petals is a "burr" (apparently a Burdock burr), so that when thrown at any object, such as a coat or dress, the blossom firmly adheres to it. These Poppies are gay and sufficiently like life. For such recreations as battles

of flowers or carnivals they would prove pretty and effective missiles, and if extensively used would save many a beautiful natural blossom from an unworthy fate. It is certainly an excellent idea to attach a burr to each flower, as the little hooks upon it are harmless, yet cling firmly enough to any fabric at which the blooms are flung.

"LLOYD'S NATURAL HISTORY."—The first part of this useful series of volumes has appeared this month, and is devoted to "British Birds," (Part 1), by R. BOWDLER SHARPE, LL.D. &c. The letter press is good and reliable, the information being tabulated in a business-like way, while each part contains (for the price of sixpence!) from ten to twelve coloured plates. *Lloyd's Natural History* is to be issued in weekly parts, three parts forming a volume. Twenty-

**MAGNOLIA WATSONI.**—Messrs. VEITCH send us flowers of this new and distinct Magnolia, figured in our columns, August 18, 1894. The deciduous leaves are obovate, dark green and smooth above, slightly pubescent beneath. The flower-buds are club-shaped or roundish, the outer segments lilac or pink, the inner ones fleshy or almost leathery in texture, rich cream-coloured; the numerous stamens, forming a ring within the petals and half their length, are of carmine colour, contrasting alike with the cream-coloured petals and the green carpels in the centre. The perfume is almost too strong to be agreeable.

**PRIZES FOR LENT LILIES (HELLEBORUS ORIENTALIS), &c.**—The undermentioned prizes for the oriental Hellebore and its varieties are offered to all owners, amateurs, gardeners, or nurserymen. The

past ten years cleared every head that showed on my ten large Asparagus-beds during two months, not allowing the smallest head to remain ungathered; and between June 21 to 28 the beds were weeded by hand, the Asparagus season being then considered over. The plants grow fast and become green, and if the fly shows itself, it is only in much reduced numbers, and not a yellowing stalk is observable. The reason for this is simple: at the breeding time the insect can discover no place in which to lay its eggs, and in July there come only belated insects, which at that time are unable to find tender heads of grass, as the plants develop with great rapidity at that warm season.

**SALE OF THE ARDDARROCH (ORCHIDS.**—On Tuesday and Wednesday last week the hothouse species included in this famous collection of Orchids came to the hammer. As the auctioneers (Messrs. PROTHEROE & MORRIS) remark in their announcement of the sale, no collection ever contained so many grand forms of *Cattleya Mendeli*, only the finest varieties having been retained out of some hundreds that have flowered. A large number of *Cattleya aurea*, many of which have not flowered, were included in the sale. Mr. BROOMAN WHITE intends to continue the cultivation of cool Orchids, but a few of the fine species and varieties of *Odontoglossum* were disposed of at the sale. *Cattleya Mendeli* var. *Empress of India*, with sixty pseudo-bulbs and one lead, fetched 60 guineas; C. M. *Sea Gull*, eight pseudo-bulbs, one lead, 30 guineas; C. M. *Mrs. Brooman White*, eight pseudo-bulbs, three with leaves and two leads, 40 guineas. Another with four small pseudo-bulbs and one lead, 17 guineas; and another with eleven pseudo-bulbs, 50 guineas; C. M. *Argus*, with thirty-eight pseudo-bulbs, six leads, flowers of a dark purple colour, 16 guineas; C. M. *Cock of the North*, 8 guineas. *Cattleya gigas purpurea*, a plant with eleven pseudo-bulbs, bought at the Temple Show in 1893, and described in the *Orchid Review* for September, 1895, fetched 14 guineas; C. *aurea*, with thirteen pseudo-bulbs, 5 guineas; C. *Warneri superba*, with twelve pseudo-bulbs, 5 guineas; C. *Mossia Horsmani*, nine pseudo-bulbs, petals and tube of lip rich rose, and latter heavily crimped, 8 guineas; *Odontoglossum excellens*, a splendid variety, two pseudo-bulbs, 25 guineas; O. *Alexandra*, 10 guineas; another, 21 guineas; and yet another 19 guineas. *Cattleya Trianae albida*, with 200 pseudo-bulbs, sold for 11 guineas, and a plant of C. T. *albens*, with thirty-four pseudo-bulbs, brought in 5 guineas; C. hybrid *Lawra-Mossia*, with six pseudo-bulbs, the plant which received an Award of Merit at the Royal Horticultural Society's meeting in April last, fetched 11 guineas; one of *Laelia grandistenebrosa*, with fourteen pseudo-bulbs, with very fine large blooms, 11 guineas. We notify only a few of the leading species and varieties; and, judging from the sums obtained for the Orchids of lesser estimation and variety, the proceeds of the sale must have been extremely satisfactory to the vendor.

HIS GRACE THE DUKE OF BEDFORD. (SEE P. 762.)

four parts are already arranged for, and will be devoted—six to birds and six to butterflies, and three to cats, marsupials, monkeys, and mammals, respectively. The first issue will be completed in forty-eight parts. Dr. BOWDLER SHARPE is the editor, assisted by Messrs. LYDDEKER, H. O. FORBES, W. F. KIRBY, and W. R. OOLIVIE-GRANT. The publishers are EDWARD LLOYD, Limited, 12, Salisbury Square, Fleet Street.

**ORCHID HYBRIDS.**—Mr. HANSEN, the author of the most complete list of hybrid Orchids yet published, writes that he is now compiling the second supplement to his work, to include hybrids named or described since October, 1895. Mr. HANSEN, whose address is Jackson, California, solicits information as to recent hybrids, and corrections of former records where necessary. The courage and industry of Mr. HANSEN, under unpropitious circumstances, will ensure him a large measure of sympathy and assistance.

plants are to be judged mainly by their fine growth and bloom; they must be grown in the open air, and shown in massed bundles, baskets, pots, or tubs at the first meeting of the Royal Horticultural Society in March, 1897. First prize for a group of twelve plants in not less than six varieties, £7 7s.; 2nd prize, £3 3s. Varieties of *H. niger* and *H. viridis* are excluded. We print the above circular as we received it, but we are not accustomed to see the term Lent Lilies applied to the Hellebore, but rather to the Daffodil, and very often to *N. Telamonius plenus*. Again, the restriction to *Helleborus orientalis* seems peculiar.

**THE ASPARAGUS-FLY.**—We take the following interesting particulars of a method of freeing beds of Asparagus from this destructive insect from the *Illustrated Flora* of June 1, 1896: "M. H.," the writer of the notice in question, remarks, "I cannot resist the temptation to impart the most certain and unfailing remedy against the Asparagus-fly. Following HERRN JOHANN MEDITSCHKA'S advice, I have for

**MESSRS. SUTTON & SONS' ANNUAL EXCURSION.**—This trip, which is always rendered so enjoyable by the forethought and liberality of the firm, took place on Monday, the 8th inst. Portsmouth and Ryde were chosen this year to be visited, and the weather being exceptionally fine, and the arrangements perfect, the outing was a thorough success in every way. The heavy special train left Reading at 7.0 A.M. bearing a party of about 600, and accompanied by Mr. and Mrs. M. J. SUTTON, Mr. and Mrs. H. SUTTON, Mr. and Mrs. A. W. SUTTON, and Mr. L. G. SUTTON, and reached the Harbour Station about 9.0 A.M. Here a special steamer was in readiness to take those on board wishing to go to Ryde and other parts of the Island. Many of the excursionists, however, remained to visit the dockyard and H.M.S. *Inflexible* (facilities for seeing which had been specially arranged by the Commander-in-Chief), Gosport, Southsea, &c. Others availed themselves of the opportunity of a cruise round the Isle of Wight, on board the *Heather Bell*. The return train reached Reading shortly before 10 P.M.

**CLAY CROSS HORTICULTURAL SOCIETY.**—The thirty-ninth annual exhibition of this Society, which is one of the most popular in the Midlands, will take place on August 11 next. Though owing to the inclement weather a loss of something like £140 was incurred last year, the spirited committee yet state in their address, which forms a preface to the schedule of prizes, that "owing to the greater interest that has been taken in gardening of late years, it is more than ever essential that the finest specimens of horticultural skill should be brought together, in order that others may reap advantage from the standard of excellence exhibited." With this in view, the committee are offering prizes equal in value to those of last year; nearly £250 having been taken, the fête is to be made still more attractive.

**SHIRLEY AND SURROUNDING DISTRICTS GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.**—The monthly meeting of this body was held on the 15th inst. at the Parish Room, Shirley, Southampton, Mr. E. J. WILCOX presiding. Mr. ERNEST LADHAMS of the Shirley Nurseries, gave a well-considered paper on "Rockery Plants," in which he said that in the formation of a rockery very large rocks should be used, and the idea should be to construct a miniature mountain, with passes, valleys, spurs, &c., and to so plant the same that each subject should occupy a place similar to that in which it would be found in nature. A long list of suitable plants was given, and it was recommended that plants with woolly leaves should have a sheet of glass placed over them in winter to prevent them getting too wet and so being destroyed. The paper was admirably illustrated in an unexpected manner, for Mr. LADHAMS had erected on the stage a miniature rockery, planted complete, with a great number of suitable subjects, and which formed a pleasing and effective whole, instructive withal. A hearty vote of thanks was accorded the lecturer, and a certificate of merit for the rockery, which occupied a considerable space. An outing was arranged to Windsor and Chelsea to take place on July 20.

**CHILDREN AND NATURAL HISTORY.**—*Nature Notes* for June contains a report of the annual meeting and *conversazione* of the Selborne Society, and of a speech by Mrs. BRIGHTWEN, advocating the encouragement in children of a taste for natural history. The speaker was particularly urgent in insisting that (animal) life need not be sacrificed by those who would study it, or, rather, that with increasing knowledge the desire of hunting and killing specimens would cease. Concerning vegetable life, Mrs. BRIGHTWEN said that—"It was needful to cultivate a love for plants and flowers while young, and the first thing was to teach children to observe the things of interest, even in the commonest plants, say, for instance, the Dandelion. First in the spring the bright green leaf and its shape, so suggestive of its name, *dent-de-lion*, with its tooth-like notches, then the rising up of the flower-stem straight from the root, and the unfolding of the bright yellow mass of bloom, and how, when fertilised by the bees the stem droops, to rise again a little later with the round ball of fluffy seed on the top to be blown out by the summer breeze and carried away. This may be made very interesting when walking with young people; but yet more is needed. You need to make them retain what they learn, and a good plan to attain this is to carry a natural history note-book, and to get them to gather a few specimens as they walk, and to write down any particulars, and to make a drawing of them afterwards; of course very crude at first, but they will improve as they learn to notice more accurately the various details. A most delightful book could be made in this way by gathering specimen leaves of the various English forest trees, the leaves pressed out on the page, and notes made of the character of the bark, the method of seeding, the uses the timber is applied to, &c., and only consider the many delightful walks it would take to complete such a book as that from day to day, and how it would set their (the children's) busy eyes to work to notice and find out fresh trees from time to time.

From trees the study could easily pass to Ferns and other things, and so would be created a taste for the beautiful in Nature and a desire on the part of each to have the most perfect and complete collection. The drawing of the specimens may be thought to be a difficulty; some may have no taste for drawing, yet it is wonderful what can be done by those who try, and if you can but get them to look carefully at any object before they try, they will find it not so very difficult after all."

**INFLUENCE OF RAIN AND SPRAY ON THE FORM OF LEAVES.**—The interesting work by STAHL (REGENFALL & BLATTOESTALT) has directed attention to the modifications which affect the leaves of plants exposed to heavy rains. The observations were made in the gardens at Buitenzorg, Java, and consequently bear reference to tropical vegetation. They establish the facts that, under the influence of rain, the tips and dentations of the leaves lengthen and become finer, that the leaves frequently assume a position of vertical suspension, that the veins change into small channels by which the water can easily flow away, and, lastly, that the arrangement of down on the leaves and stems contributes to the dispersal of the drops of water. Other observers (LUNDSTRÖM and WILLE for instance) have already mentioned some of these peculiarities, but the work of STAHL offers new aspects of the case, and contains some very instructive details. The necessity of relieving the leaves of their weight of moisture directs the water towards the roots and frees the upper parts of the plants; this frees the leaves from epiphytic algae, fungi, and lichens; rapidly dries the surface of the leaves so as to favour transpiration. These are the reasons according to STAHL which partly explain the morphological peculiarities of plants subjected to heavy rains. The distinctive feature of leaves exposed to rainy seasons is the lengthening of their tips, and this peculiarity is not merely apparent in tropical plants, but also in plants which live in sand and receive salt spray; on plants upon high mountains and high plateaux moistened with heavy dews, and, further, on plants of the temperate zone where the precipitation is considerable. *Traufelspitzen* is the name which characterises plants growing in the spray from waterfalls, and various illustrations show the difference of the shape of leaves in their normal state, and when exposed to spray. Under this latter condition the down habitual upon the leaves disappears; this down tends to hold moisture too long, and on the stems may be noted a certain arrangement of the leaves, favouring the speedy flowing away of water. By covering the surface of a leaf with wax it becomes less easily impregnated. That experimental part of the work is most important wherein it is demonstrated how it is possible, in a greenhouse, to modify the shape of leaves by exposing them to a regular fall of water or to an artificial spray. The characteristic shapes induced by rain and spray can thus be developed in many plants. It is clear that, in all cases, the special shape must not be attributed to any more marked cause than the direct influence of environment. All the experiments cited by JUNONER have a special relation to modern ideas on the phenomena of adaptation, ideas which will be developed as widely and as surely by the study of plant morphology as by that of any other branch of science. *Revue Scientifique*, May 16, 1896.

**FRUIT-DRYING.**—The Council of the Society of Arts at its last meeting awarded the Society's Silver Medal to Mr. EDWARD W. BADGER, F.R.H.S., of Birmingham, for his paper on "Fruit and Vegetable-drying," read before the Society in April last. A meeting of the Worcestershire Chamber of Agriculture, held on Saturday last (13th inst.), was devoted to the discussion of the subject of "Fruit Evaporation," and Mr. BADGER (by special invitation) attended the meeting and explained to the large body of fruit-growers assembled on the occasion the construction of the evaporator and the way to manipulate it. The subject was apparently a new one to most of the audience, as was shown by the questions asked. It is a hopeful sign that the Chamber of Agriculture, in such an im-

portant fruit-growing county, should have brought the subject of fruit-drying before their members. It would be a good thing if the other fruit-growing counties would follow this example.

Mr. D. T. FISH, who is leaving Bury St. Edmunds for Edinburgh, was the recipient, on Thursday evening, 11th inst., of a gratifying testimonial in the shape of a silver salver from the members of the Congregational Church, in which Mr. FISH has served as deacon for thirty-eight years.

## PLANT PORTRAITS.

**AMORÆCUM FOURNIEAE**, André. A small white-flowered species, native of Madagascar, described and figured in the *Revue Horticole*, June 1.

**BENTINARIA NICOBARICA**, *Revue Horticole*, p. 249 (woodcut).  
**BRUGMANSIA CHLORANTHA**, *Garden*, May 23.

**COSTUS SPECIOSUS**, a Scitamineous plant, with flowers in close terminal spikes with crimson bracts; the most conspicuous part of the flower is the large white convolute labellum. *Illustration Horticole*, t. 56.

**CRINUM LEBEMANNI**, a beautiful rose-coloured hybrid, between *Amaryllis longiflora* and *Crinum Makoyanum*, raised in the establishment of Messrs. Lesemann, of Vienna. *Wiener Illustrirte Garten Zeitung*, April.

**CYPRIPEDIUM RIDOLFIANUM** X. A cross between *C. Wallerianum* and *C. insignis Chantini*, raised by Messrs. Sander & Co. *Bulletino della R. Società Toscana di Orticultura*, May.

**DENDROBIUM SPECIOSISSIMUM**, Rolfe, a white-flowered species, introduced from Borneo by Messrs. Hugh Low & Co. *Garten Flora*, May 1, t. 1426.

**LÆLIA ELEGANS TURNERI**, *Garden*, May 23.

**PENTSTEMON COBEA**, *Garden*, May 30.

**SAXIFRAGA RUETIANA**, *Revue Horticole*, June 1, p. 262.

**ZEPHYRANTHES TAUBERTIANA**, Harms, Brazil, *Garten Flora*, June.

## BOOK NOTICE.

**COCOA.**—The popularity of Cocoa (*Theobroma Cacao*) as a beverage, and of chocolate as a confection, has caused the demand for the so-called Cocoa-bean to have increased to an enormous extent during the past few years. It is quite within the memory of many who cannot claim to be more than of middle-age when cocoa and chocolate manufacture was confined to a few firms represented by such old-fashioned and well-known names as Fry and Cadbury. We now have not only increased the number of English firms who prepare these invaluable beverages and confections, but we also import the foreign-made products to a large extent, so much so, that rival chocolates and cocoas are amongst the most prominent objects in the advertising craze. In view of these facts, it stands to reason that the subject of cocoa would offer a prolific field for book-writing, which indeed, has been the case, for we have had cocoa treated from all aspects; the most recent of these contributions is one that has been put forward by Messrs. Sampson Low, Marston & Co., Ltd., being a new edition of *Cocoa: All About It*, by Historicus. It is very well got up and well illustrated, though we object to the blue ink that has been used, both for type and plates. The contents of the book are classified in four chapters, the first treating of the "History and Cultivation of the Cocoa Plant"; the second, the "History of the Use of Cocoa"; the third, "Manufacture;" and the fourth, the "Value of Cocoa as Food and its Adulterations;" and in addition to this a few pages are given at the end of the book on "Vanilla," which, considering that it is only one of the flavouring agents used in the preparation of chocolate—though, of course, an important one—might well have been omitted, especially as no reference whatever is made to the valuable paper on "Vauillas," recently published in the *Kew Bulletin*; and further, the scientific nomenclature has been so carelessly revised, as on p. 96, where *Melia Azadirach* occurs for *M. Azedarach*, *Tecoma Lenocoxylon* for *T. Lenocoxylon*, *Tatropa curcus* for *Jatropha Curcas*, &c.

Returning, however, to the body of the book, we find a good deal of interesting matter in the first two chapters.

The following extracts will show the nature of some of the "curiosities of literature" connected with cocoa and chocolate drinking, which will no

doubt be new to some of those who think they already know all about cocoa. On the question of "fasting from chocolate in Lent," published in Italian by Daniel Concuna, Venice, 1748, he says:—"Among the first probabilist theologians who undertook to write entire treatises, and to collect all the possible reasons as to whether the Indian beverage (chocolate) could agree with European fasting was Father Tommaso Hurtado. He employed the whole of the tenth treatise of the second volume of his *Moral Resolutions*, printed in 1651, and added thereto an appendix of more chapters. Father Diana found reason for acquitting the consciences of those who in time of fasting should drink chocolate. Father Hurtado, more courageous withal, and more benign than Diana, does not speak of this treatise in order to investigate the law; the nature of fasting admits drinking without eating. . . . Therefore, consumers are, without the help of casuists, troubled themselves and afflicted, when in Lent they empty chocolate cups. . . . Excited on the one hand by the pungent cravings of the throat to moisten it, reproved on the other for breaking their fast, they experience great

easily lay low these Chiapa dons, and gain the whole city, which lyeth so open to the fields that the mules and asses come in and graze. . . . The women of that city, it seems, pretend much weakness and squeamishness of stomach, which they say is so great that they are not able to continue in church while the mass is briefly hurried over, much less while a solemn high mass is sung and a sermon preached, unless they drink a cup of hot chocolate and eat a bit of sweetmeats to strengthen their stomachs. For this purpose it was much used by them to make their maids bring them to church, in the middle of mass or sermon, a cup of chocolate, which could not be done to all without a great confusion, and interrupting both mass and sermon. The Bishop perceiving this abuse and having given faire warning for the omitting of it, but all without amendment, thought fit to fix in writing upon the church-doors an excommunication against all such as should presume at the time of service to eat or drinke within the church. This excommunication was taken by all, but especially by the gentlewomen, much to heart, who protested, if they might not eat

that which he had drunk in his house had not agreed with his body, and it became afterwards a proverb in that country, 'Beware of the chocolate of Chiapa.' The gentlewoman that was suspected of the death of the Bishop had often used to send me boxes of chocolate, which I willigly received of her, judging it to be a kind of gratuity for the paines I took in teaching her son Latin; untill one day she sent unto mee a faire plaitin, wrapped up in a handkerchief buried in sweet Jassimines and Roses; and looking further upon it, I found worked upon it with a knife the fashion of a heart, with two blind Cupid's arrows sticking in it, discovering unto my heart the thoughts of the poisoner that sent it. I thought it a good warning to be wary of receiving such presents, or chocolate, from such hands, and so returned unto her again her plaitin with this short rhyme cut out with a knife upon the skinne— 'Fruta tan fria, amor no eria;' as much as to say, 'Fruit so cold, takes no hold.' I remembered the Bishop's chocolate, and so was wary, and stayed not long after in that poisoning and wicked city, which truly deserves no better relation than what I have given of the simple Dons and the Chocolate Confectioning Donnas."

We have given these extracts at length, both on account of their quaint interest, and as showing the prejudice that mostly attaches at first to any new product of food, drink, or medicine.

**BRODIAEA HOWELLI LILACINA.**

At the last meeting of the Royal Horticultural Society, Messrs. Wallace of Colchester showed a fine series of specimens illustrative of the genus *Brodiaea*. It was worthy of a better fate than being crowded in among a number of very beautiful, but much more familiar, and therefore less interesting, things. Messrs. Wallace have kindly sent us specimens of these plants, to which we shall hereafter allude. In the meantime, we give an illustration (fig. 134) of one of the least known, and one of the prettiest species. The flowers are in umbels on the top of long, slender spathes. Each flower is about an inch in length, with a bluish-lilac, funnel-shaped perianth-tube contracted at the throat. The limb is divided into six rounded spreading lobes of a silvery-white colour. The plant obtained a First-class Certificate.

**HOME CORRESPONDENCE.**

**OLD AND NEW GRAPES.**—It will always be a matter of moment with cultivators of the Grape-vine to have fruit as early in the season as it is procurable. This is as it should be, when there are means to bring early Grapes to perfection; but there are many persons who cannot afford to cultivate Grape-vines in pots to supply fruits in the months of April and May, or set a house apart for the purpose; but many can have Grapes at the period indicated by keeping them in the usual way, as cut bunches, in Grape-rooms, cupboards, or ordinary rooms in dwelling-houses, or in fruit-rooms. I have for many years past supplied my employer's table with old Grapes till after Midsummer, new ones, which are ripe in May, going into the same box; and except the more sugary flavour of Lady Downes, cut and bottled at the new year, there is little to choose so far as appearance is concerned. I exhibited old and new Grapes together at a leading show held thirty years ago. The new ones were Hamburg, and took the first prize among thirteen other exhibits. They were written well about, but the fresh, finely-kept old fruit was barely noticed by the press. The expense of growing these Grapes and trouble of keeping them is comparatively small when put against the skill, expense, and attention necessary to grow early fruit. I enclose a sample of those we have been sending of late, and though early Hamburgs are large in berry and of more imposing appearance than the enclosed, the latter are not despised, and are likely to be in fair condition well into July. *M. Temple, Carron, N.B.* [The fruit our correspondent sent was plump and good. Ed.]

**CABBAGES BOLTING.**—Several paragraphs have recently appeared in the *Gardeners' Chronicle* upon the subject of autumn-raised Cabbages bolting during

remorse of conscience, and with consciences agitated and torn with drinking the sweet beverage, they sin. . . . Under the guidance of these skilful theologians, the remorse aroused by natural and Divine light being blunted, Christians drink joyfully." The treatise closes by saying:—"For all agree that he will break his fast who eats any portion of chocolate, which, dissolved and well mixed with warm water, is not prejudicial to keeping a fast. This is a sufficiently marvellous pre-supposition. He who eats 4 oz. of exquisite sturgeon, roasted, breaks his fast; if he has it dissolved and prepared in an extract of thick broth, he does not sin."

This is a sufficiently curious argument, but the following from Gage's *New Survey of the West Indies*, published in London in 1648, is even more curious. Speaking of Chiapa, southward of Mexico, he says:—"Here are two cloisters of nuns, which are talked of far and near, not for their religious practices, but for their skill in making drinks, which are used in those parts, the one called chocolate, another atolle. Chocolate is (also) made up in boxes and sent not only to Mexico, but much of it yearly transported into Spain. The gentlemen of Chiapa are a by-word all about that country, of great birth, pharistic pride, joyed with simplicity, ignorance, and penury. One hundred fighting soldiers would

drinke in the church they could not continue in it, to say what otherwise they were bound unto. But none of these reasons would move the Bishop. The women seeing him so hard to be entreated began to slight him with scornfull and reproachfull words; others slighted his excommunication, drinking in iniquity in the church, as the fish doth water, which caused one day such an uproar in the cathedral that many swordes were drawne against the priests who attempted to take away from the maids the cups of chocolate which they brought unto their mistresses, who, at last seeing that neither faire nor foule means would prevail with the Bishop resolved to forsake the cathedral; and so from that time most of the city betooke themselves to the cloister churches, where by the nuns and fryers they were not troubled. . . . The Bishop fell dangerously sick. . . . Physicians were sent for far and neere, who all with a joynt opinion agreed that the Bishop was poisoned. A gentlewoman with whom I was well acquainted was commonly censured to have prescribed such a cup of chocolate to be ministered by the page, which poisoned him who so rigorously had forbidden chocolate to be drunk in the church. My self heard this gentlewoman say that the women had no reason to grieve for him, and that she judged, he being such an enemy to chocolate in the church,

FIG. 134.—BRODIAEA HOWELLI VAR. LILACINA. FLOWERS LAVENDER BLUE, WITH WHITE SEGMENTS

the last couple of months. If seed of a good strain be sown from the middle to the third week in July in the northern counties, and two weeks later in the south, and the young plants resulting from these sowings be pricked out 6 inches apart in nursery-beds as soon as they have made a couple of perfect leaves, and are finally transplanted in well-prepared ground before they become crowded or stunted in growth, and duly attended to in the matter of affording water till the roots have pushed into the soil, and then earthed up to steady the plants, bolting should not occur the following spring, no matter how mild the winter may have been. In fact, the only difference a mild winter can make to such plants is to cause them to turn-in earlier than would otherwise be the case, thereby enhancing the value of the crop considerably in a commercial point of view. On the contrary, if plants are allowed to become crowded and stunted in the seed and nursery-beds before being finally transplanted in, perhaps, imperfectly-prepared and unsuitable ground—or in good ground for that matter—late in the autumn, "bolting" and poor heads might reasonably be looked for the following spring as the result, not of the weather, but of the treatment to which the plants were subjected in the beginning through pressure of work or other cause. The varieties of the Cabbage that I always put reliance in are Longford Marrow (a variety of my own) and Carter's Heartwell. My autumn-raised Cabbages are always planted in ground from which the spring-sown Onions had been cleared; trenching this a little over 2 feet deep, and incorporating therewith two or three layers of substantial manure in the process of trenching. When the plants are ready for planting (about the third week in September), the ground is trodden over, drills 3 inches deep are drawn at 2 feet apart, and into these the plants, after the roots have been dipped into a "puddle," into which a little soot had been stirred, are planted at 2 feet from plant to plant, and watered; soil being drawn up to the plants on either side as soon as they have made sufficient ground to render this needful operation necessary. *H. W. Ward.*

**THE STARCH CONTENT OF POTATOS, AND SUGAR CONTENT OF SUGAR-BEET.**—I have seldom been more interested in a series of facts than those tabulated by Mr. J. J. Willis in the *Gardeners' Chronicle*, pp. 365 and 366. Several of these seem destined to have an important bearing on our future modes of cultivating the Potato, such, for example, as the tubers that grow deepest in the soil are richest in starch. Potatos grown rather closely in drills were richer in starch than those grown in rows both ways. The higher the starch content, the sooner a Potato cooks, and the more it swells in cooking. The market value of Potatos should be based on the starch content rather than on their bulk. From the Wisconsin experiments it does not appear that the relations of starch content to bulk or weight of tuber was subjected to careful testing. As a very general opinion prevails among Potato-growers and eaters that excess of size is often made at the expense of quality, the relation of the one to the other will have to be more carefully investigated. Especially is this necessary in full view of Mr. Willis' final conclusion of the whole matter, viz., that the ratio of starch in Potatos varies from 8 to 29 per cent., and that there is no good reason why a lot of Potatos that averages 12 per cent. of starch should sell for as much per bushel as another lot that average 20 per cent., for the latter are worth much more for food than the former, while being more desirable in every way. As to the expansion of Potatos in cooking, has Mr. Willis, or any other reader of the *Gardeners' Chronicle*, any statistics on that point? The general public may also be said to universally believe that the flavour of Potatos depends solely or chiefly on their starch content. If not necessarily so, as we are now assured, then upon what does the nutty flavour of the best Potatos depend? In all the experiments it seems the specific gravity—which is, I presume, practically equivalent to the starch content—was highest from the deeper-growing tubers. These facts impress me the more from their striking resemblance to similar ones brought out some twenty years ago in the growth of Sugar-Beet in England. The deeper in reason the Sugar-Beet was grown, the higher the percentage of sugar in the crop, which ranged, if I remember rightly, from 6 per cent. to 18. The smaller roots of Beet also produced the highest percentages of sugar; and this began to be so generally recognised, as to be formulated in simple instructions thus: To grow the heaviest crops of sugar, the average weight of the whole Beet-roots

should not exceed 6 lb. a-piece. The more entirely the whole roots were hilled-up or covered over with earth, the higher also the percentage of sugar. So far, the conditions of starch and sugar-growing seem identical. And now comes a difference. Forked or pronged tubers of Potatos are said to be inferior in their starch content to regular ones. The opposite was found true in Sugar-Beet. Hence, it may be important to test both starch and sugar contents of these two crops in their relation to form and size, as well as depth of root or tubers. In regard to Sugar-Beet, Mr. Willis will remember that the sugar content, crop and profits, of the English-grown Sugar-Beet were perfectly satisfactory, and that this promising industry, which might have done much to benefit British agriculture, was arrested through a fluke. *D. T. F.*

**NEMESIA STRUMOSA.**—This charming annual is worthy of extended cultivation. It has been discarded, I assume, because of its scarcity of foliage. A few days ago I saw two magnificent beds of the plants at the residence of W. Soot, Esq., Ryedale, Weybridge, and was much pleased with it, the rich and varied colours rendering them very attractive, the colours bright, especially the yellow and orange. The gardener, Mr. Baynes, informed me that he sowed the seeds early in the year, pricked out the seedlings into boxes, and thence into the open beds, a treatment that is evidently correct, for the plants are the finest and best flowered that I have met with. If it would bear pegging down it would doubtless make a good bedding-plant, as it continues in flower a long period of time. *J. W.*

**TOMATOS AND DISEASE.**—I have a span-roofed house, 95 feet long, planted with Tomatos. After the first fruits had attained to about the size of full-grown Walnuts, they were attacked with *Sporocybe Lycopersici*, quite half of the plants having some diseased fruits upon them. I kept picking off the affected fruits, but as fast I did so, the disease developed on others. At that time the bed in which were the plants had bottom heat (hot-water pipe); and I felt confident that the disease was not due to imperfect fertilisation, as in three out of four cases the disease began at the sides of the fruits. Neither was it insects, for I never saw any insect upon them; nor was the soil at fault, because they were planted in loam without any additional material whatever. The fact struck me that Potatos begun to get diseased after rain has got through the heated ground, and I thought that perhaps the bottom-heat might have a similar effect on the Tomato plants, so I entirely shut it off from them. Then as an experiment I raised the temperature of the house to 110° for two hours each day for three successive days, and the disease has not attacked one fruit since. At the time I tried these experiments there were several fruits with the disease developed, and I let these hang to see if the disease would continue to spread with these fruits still in the house; but instead of doing this the diseased parts dried up, and the fruits developed to their full size and ripened, the flavour being equal to that of any sound fruit. I have now come to the conclusion that the cause of this species of disease is excess of bottom-heat. *J. E.*

**JUNIPERUS DRUPACEA.**—Referring to recent correspondence about the above tree, I now send a photo showing a specimen in this garden 27 years old and 27 feet high, from which you will see that it is still well furnished down to the base. In clearing dead leaves, &c., from the lower part (which had never been done before), I found the lower branches making fresh buds freely, and have little doubt that had it been better looked after it would have been in still better condition. It has not produced fruit. *Alfred O. Walker, Nant-y-Glyn, Colwyn Bay.*

**THE REFRESHING RAINS.**—At last there have come the sight and sound of refreshing thunder-storms—and perhaps other rains. It has come most welcome for the fruits, flowers, and vegetables. The first have been falling fast for several weeks. It is hoped the rain may arrest the wholesale thinnings of Cherries, Plums, and Pears, before it is too late. Apricots, Peaches, and Nectarines are stoning; and Apples have withstood the drought better than any other fruit. Green Gooseberries are being gathered in enormous quantities; but Currants of all colours needed rain badly, as well as Raspberries, which seldom suffer from any excess of water during the growing season. It has been pitiable to see beds and fields of Strawberries withering their leaves badly in the hard, biting, drying winds and scorching sun. And now we have had several rains in June, rapidly bringing all things

in tune, and most of our garden crops are yet capable of being substantially mended through genial weather before being ended. And among these very emphatically are placed the later crops of Strawberries on heavy soils. The earlier crops on light lands have suffered severely. Those, however, that had the sense to mulch or the power of watering have reaped their reward. At sixteen-pence per pint in the rural districts, as these fruits were selling on Saturday, June 6, they are bound to pay well. The rains will also prove the salvation of Maincrop and late Peas; spoil the small Potatos, as the country people put it, by changing them into large ones, and afford a useful fillip to Onions, and indeed, all other green crops, such as Celery, Broccoli, Cauliflowers, Saladings, &c. While, as for the flowers, they have been waiting for the rain to help them start in growth and blossoming, to perpetuate the flush of beauty which has been with us with hardly a let or hindrance since last January. *D. T. F.*

**GOLD-LACED POLYANTHUSES.**—It has been made very evident that the exclusion of these pretty hardy florists' flowers from the schedule of the National Auricula Society this year provoked much comment and disappointment. Personally, I have much greater love for the fancy or hardy border section; but these, evidently because more easily grown, are retained in the schedule. These, however, are not florists' flowers in the same sense that gold-laced Polyanthuses are—indeed, these latter, when the flowers are perfect, are entitled to rank amongst the most refined and beautiful of such flowers—at least, in the estimation of those who understand and admire them. For the reason, therefore, that gold-laced flowers have points which are recognised, and admit of exact judging, it does seem unfortunate that the National Auricula Society should have ignored them. Admittedly they had been for several years indifferently shown, but all the same, it does seem now as if there were of these old favourites many more growers than was formerly anticipated to be the case. Now, I suggest, as the best way to remedy what seems to be an evil, that "R. D." undertake to both collect subscriptions for the purpose, and also obtain leave from the Council of the Royal Horticultural Society to advertise classes for gold-laced Polyanthuses in the next schedule, to be competed for at the meeting in April, 1897, the subscriptions to supply the prizes. The classes should be for four plants, and two plants, distinct in commerce; and four, and two seedlings. That would be ample for the first competition. Some £4 would furnish the prizes, the Royal Horticultural Society to find judges. I should be pleased to start the little fund needed, if the suggestion be generally accepted. *A. D.*

**VARIEGATED HONESTY** (*Lunaria biennis variegata*).—This variety is very useful in the spring flower-garden, but it does not seem to be grown by, or known amongst gardeners, for I have had many enquiries respecting it. The seeds were obtained from Messrs. Veitch of Chelsea. Some persons do not care for the normal form, and might not therefore think much of the beauty of this form, although it is far prettier than the type, being beautifully marked in leaf and stem with creamy-white and pink; and when the plant is well cultivated, it shows a good habit of growth. A peculiarity of the variegation is, that it does not appear until the plant begins to grow in the spring just previous to flowering. Seeds of Honesty should be sown about the middle of June, and transplanted as soon as it is large enough to handle readily, planting out in the flower-beds in the month of October. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

**INDIAN AZALEAS GRAFTED ON THE RHODODENDRON.**—When visiting the Royal Nursery, Slough, at the time the greenhouse Azaleas were in flower, I was much struck with the wonderful vigour of some small plants received from the Continent some time before, and Mr. Harry Turner informed me they were cleft-grafted on to the stock of some Rhododendrons. The plants were three years from the graft; they had fine heads, 2 feet and more across, the foliage being characterised by a wonderful robustness; and they were in remarkable contrast to some other plants grafted in the usual manner. It appeared obvious that specimens could be grown into size much more quickly by being worked upon this stock than upon that usually employed. How far the longevity of the plants may be affected, I cannot say. In all probability the experiment would not have been continued had any indications of early decay manifested themselves. *R. D.*

## THE NEW DEPARTURE.

In Long Acre, near to Bow Street, and facing Endell Street, there is situate the central *dépôt* for the reception and distribution of fruits, vegetables, and dairy-farm produce—the outcome of Lord Winchelsea's efforts to solve the problem of bringing producer and consumer into near touch, and thus securing for both a larger share of profit than it is contended, can be had under the existing system, and also to encourage growing in greater quantities for market, much—very much—of that now brought to our doors by the foreigner. Long Acre, running parallel to Covent Garden, the site for this *dépôt*, would seem, so far, to be well chosen; and the building itself, which has a face to Hart Street, with a rear entrance, is well capable of accommodating a fairly large business. There is a fine floor space on the ground floor, as also in the sunk basement; over all this are floors which may be used for many purposes. Ere the Parish Council had become an entity, we advised in these pages that, when called into existence, these in agricultural districts should be used to help gather in all sorts of produce from all kinds of growers, as a preliminary to sending forward to London and other large cities. Lord Winchelsea's scheme provides for gathering up for despatch by local agents to the Long Acre *dépôt* what is likely to meet with a ready sale in the metropolis, and if possible, we believe, to delete the middleman from the transaction; but whether this can be done by the present scheme remains to be proved. There must be an intermediary of some sort, call him what you will. There is no doubt of this, however, that if the home-grower can supply what the foreigner does, on perhaps easier terms, he will be able to sell all he can get to Long Acre or anywhere else.

The whole thing wants careful handling in the preliminary stages, and those who have gone thus far have shown courage linked to their opinions. If "Stores" can make a do out of what it is proposed to supply in Long Acre, most assuredly the scheme will pay, and thus a step be taken in the direction tending towards making agriculture once more a popular pursuit, though very differently conducted to what it was in years gone by. The *dépôt* building is nearly completed, and we believe will shortly be opened for business. *E. C.*

## SCOTLAND.

### GLASGOW BOTANICAL GARDENS.

VISITORS to Glasgow who are interested in horticulture should not fail to visit these gardens, which the corporation have now taken in hand. A variety of improvements have been made in every department, and it did well when the services of Mr. Dewar were secured, for under his intelligent and eminently practical management the various departments show a great and notable improvement. In all there are some new features present; the plants have greatly increased in numbers, and many novelties of merit have been added. Orchids are becoming more numerous, and valuable plants are constantly being obtained. The cultivation of these plants leave little to be desired. New flower-beds have been formed, and planting has been extensively carried out during the last few years; and the examples of the various styles in gardening are now practically completed. A hardy Lily-pond was recently formed, with waterfalls and fountains and a stream running through a new rock garden. The last-named, when the plants have become established, will form a pleasing addition to attractions of the place. The bedding-out is almost finished for this season, and a grand show will be made. Several capital new houses have been erected to accommodate a variety of plants.

The noble collection of Tree Ferns in the Kibble House ranks amongst the most complete in the Kingdom, and the plants are in a fine, healthy, and vigorous condition. This enormous house contains much to interest those desiring an acquaintance with medicinal and useful plants.

The various greenhouses to the right and left of the entrance are gay, at the present season, with flowering plants, well grown and arranged. The Palms in their gigantic house are splendid examples of cultivation. The large collection of the Cactus family has several flowering examples that are at the present time a great attraction to visitors. The plants of *Nepenthes* have a plentiful crop of pitchers. *Caladiums*, *Codiceums*, and *Dracenas*, mixed with flowering plants, especially *Gloxinias*, form an imposing display. In the tropical aquarium a fine collection of *Nymphaea* in flower was noted. The bothy accommodation in the gardens has been much improved, and the comfort of the young gardeners studied in other desirable directions. It may be remarked that the new railway which has been made under the garden has rendered many alterations necessary, including the planting of many trees and shrubs. A new entrance with lodge has been made, which form an attractive feature, now that the surrounding planting is getting established. The Thorns in variety, pink, white, scarlet flower, the *Laburnum* and *Rhododendrons* are flowering beautifully this year. *A. Outram.*

## SOCIETIES.

### EDINBURGH BOTANICAL.

JUNE 11.—The eighth meeting of the session was held by this society on Thursday evening last at 6.30 p.m. in the Lecture Hall at the Royal Botanic Garden. Mr. A. P. AITKEN in the chair, a fair number of members being in attendance.

After the reading of the Proceedings of the Council, Colonel F. BAILEY, R.E., exhibited a rather remarkable specimen of subcortical roots in *Fagus sylvatica*, taken from a tree at some distance below the level of the ground. Professor J. B. BALFOUR spoke of this being more common in such trees as the Willow, &c., and in the present case was perhaps caused by injury to the trunk, the roots finding their way under loose bark, and spreading into a fibrous mass.

The plants exhibited from the Royal Botanic Garden included *Saxifraga longifolia*, *S. lingulata*, *cochlearis*, *S. altissima*, *Kerneria saxatilis*, *Incarvillea Delavayi*, *Masdevallia muscosa*, *M. Rolfeana*, *Hemanthus Katherinae*, *Gladiolus gracilis*, *Dendrobium Falconeri*, *Cirrhopetalum maculosum*, and others of interest.

The report read by Mr. A. D. RICHARDSON of meteorological observations, showed some very unusual statistics regarding the month of May, both in the rainfall and percentage of sunshine. He stated that trees, shrubs, and herbaceous plants generally flowered profusely, but owing to the drought and bright sunshine, their period of flowering was short. The highest reading of the barometer at 9 A.M. was 30.459, on the 26th; lowest, 29.679, on the 19th, being 0.290 inch above the average. Protected thermometers:—Highest, 75.8°, on the 11th; lowest, 36.3°, on the 1st. Mean of the month, 53.9°. Radiation thermometers:—Highest in the sun, 121.7°, on the 14th; lowest, on grass, 26.7°, on the 1st; while frost occurred on the grass on five days.

Sunshine. The total amount recorded was 219 hours, 35 minutes, being 43.7 per cent. of the possible amount. No sunshine was recorded on two days.

Rain fell on eight days, the total fall being 0.580 inch, being 1.357 inch below the average. The greatest fall in twenty-four hours was on the 18th, 0.255 inch being then recorded.

Mr. R. L. HARROW, in his report on plants in the plant-houses, stated that the latest completed section of the new range was now almost ready for admitting the public, the plants having now become fairly established.

After the meeting, the members inspected the plant-houses, rock-garden, and other interesting features of the garden.

### THE YORK GALA.

(By Telegraph.)

WEDNESDAY, THURSDAY, AND FRIDAY, JUNE 17, 18, 19.—York Gala is a very fine exhibition in every respect, perhaps the finest yet seen. Unfortunately, the weather was unpropitious. Fruit was good all round, black Grapes especially so. The Royal Horticultural Society's deputation awarded medals as follows:—Group of plants, &c.: Sir James Reckitt, Hull, took the 1st prize; Mr. C. J. Mee, Nottingham, 2nd; Mrs. Gurney Pease, 3rd; Mrs. Tetley, Leeds, took the leading prize in Pelargoniums. Mrs. Tetley was 1st for Zonals; Messrs. Veitch, Chelsea, for groups of stove and greenhouse plants, receiving a Gold Medal. Messrs. Cutbush & Sons, of Highgate, obtained a Gold Medal for a collection of decorative plants; and Mr. Cypher, Cheltenham, took the chief prize for a collection of stove and greenhouse plants, Orchids excluded. The latter for specimen stove and greenhouse plants, which were, on the whole, very fine. Orchids were a fine feature

of the show, and were much admired. Mr. Cypher, Dr. Jessop of Leeds, and F. Hardy, Manchester, won the main prizes. Trade exhibitors included Messrs. Sander, Messrs. Charlesworth, and Messrs. R. Low & Co., London, who had also an award of a Gold Medal for a collection of Orchids. Plants in abundance, groups of Carnations, and bunches of cut flowers were very striking. Sir Joseph Pease was the most successful exhibitor in the fruit classes, being 1st for ten, six, and four dishes.

The display in the several marquees, if not absolutely up to the standard of previous years in every department, was, at any rate, in point of variety, hard to equal, and in very few instances could a comparison with one or two of the best of the former shows exhibit much of a decline. The Council, which has had the arrangements in hand, had taken a sure step towards realising an extensive collection of exhibits by offering a total of £700 as prize money, an advance of £50 on the previous year; while the visit of the President and Council of the Royal Horticultural Society brought about the award of several extra medals and the granting of various commendations, all of which are expected to stimulate greater activity in the pursuit of flower, plant, and fruit growing. As usual, considerable interest was shown in the class for groups of miscellaneous plants arranged for effect, and it was matter of general remark that in this department the display of the present exhibition was simply magnificent. Special mention should be made of the class for 72 Roses, single blooms, of not less than 36 varieties. Messrs. D. PRIOR & Son took 1st prize with a charming arrangement, and three further awards were made in the same class, a total of £18 being distributed over the four prizes. In the fruits and vegetables department, Sir J. W. PEASE, M.P., and the Duke of ST. ALBANS were 1st and 2nd in the class for collection of ten varieties. The deputation of ten members and office-bearers of the Royal Horticultural Society, including the Rev. W. Wilks (Secretary), having inspected the exhibits in the several tents, made the following special awards on behalf of the above-named society:—Silver-gilt Flora Medal, Messrs. J. Veitch & Son, for group of plants; Silver Flora Medal, Mrs. Tetley, for Pelargoniums; Silver Banksian Medal, Mrs. Gurney Pease, for Ferns; Mr. C. J. Mee, for group of plants; Sir J. Reckitt, Bart., for group of plants; and Mr. H. Pybus, for zonal Pelargoniums; First-class Certificate, Messrs. Charlesworth & Co., for special variety. Awards of Merit, to Messrs. Harkness & Sons, Messrs. Low & Co., Messrs. Charlesworth & Co., Mr. George Yeld, Lord Deramore, Mr. J. Cypher, and Mr. H. Steel; Botanical Certificate, to Mr. T. R. Jessop; High Commendation, Mr. J. Cypher, the Marquis of Zetland, Messrs. Fisher, Son, and Sibray, Messrs. Lang and Mather, Mr. A. Waterer, Mrs. Gurney Pease, and Mr. J. A. Rodwell; Commended, Messrs. Perkins & Sons, Mr. F. B. Grotrian, M.P., Mr. S. Harcastle, Sir Joseph Pease, Bart., M.P., and Mr. T. R. Jessop; and Cultural Commendation to the Rev. G. Yeats and the Earl of Zetland.

Luncheon was served in a marquee on the ground at two o'clock, the Chairman of the Council (Ald. Sir Joseph Terry) presiding. He was supported by the Lord Mayor (Ald. Milward), Sir Trevor Lawrence, the Dean of York, and a large attendance of members and well-wishers of the council. In submitting "Success to the Royal Horticultural Society," the Lord Mayor expressed his gratification at the presence of the President of the society and the members of the council. In reference to the York Horticultural Society he was glad to say they were in a very satisfactory position, having in hand a balance of between £2,300 and £2,400, and that notwithstanding that they offered substantial prizes. He coupled with the toast the name of the President of the Society.

Sir TREVOR LAWRENCE, in responding, congratulated the Yorkshire Gala Society on their successful career. He spoke the unanimous opinion of the deputation from the Royal Horticultural Society when he said that they had seen in that day's show a very complete and varied exhibition. One of the advantages of having so complete an exhibition was that they possessed something to please everybody's taste. They had felt it their duty to make a not inconsiderable number of awards on behalf of the Royal Horticultural Society, and in doing so they had desired to mark their sense of the high character and quality of the show. He dared say they were aware that the Society in sending that deputation, was taking a new departure—a departure which had recommended itself unanimously to the Council. All along they had greatly regretted not being able to bring themselves more directly into connection with the active provincial societies which were scattered up and down through the length and breadth of this garden-loving country. In its endeavours to occupy the proposed new position, the Royal Horticultural Society was acting as all true lovers of horticulture would desire it to act, and he hoped it might come to pass that the Society with which he was connected would occupy in regard to horticulture a position analogous to that which the Royal Agricultural Society held in regard to agriculture. In conclusion, he said it was the intention of the Council of the Royal Horticultural Society to visit several other shows in the provinces.

At the Dinner given on Tuesday evening at Harker's Hotel by the Gala Society, Sir Joseph Terry in the chair, the following gentlemen were present:—Sir Trevor Lawrence,

Bart, Rev. W. Wilks, and Messrs. P. Crowley, S. Courtauld, T. B. Haywood, H. Selve-Leonard, W. Thiselton-Dyer, C.M.G., Harry J. Veitch, Malcolm Dunn, and James Hudson. As will be seen, the Council, with the Scientific, Fruit, Floral, and Orchid Committees, were represented. Mr. J. Wright, one of the York Judges, and Mr. J. H. Veitch, both members of R.H.S. Committees, were also included among the guests, the party present numbering about thirty. The President and Secretary of the Royal Horticultural Society were the guests of the Lord Mayor at the Mansion House, the remaining members composing the deputation having every provision made for them at Harker's Hotel as the guests of the York Society.

The following were the Judges:—Stove and greenhouse plants—Mr. Thomas, gardener at Windsor Castle; and Mr. J. Wright. Pelargoniums, Roses, and cut flowers—Mr. Laing, Forest Hill; and Mr. Cannell, Swanley, Kent. Fruits—Mr. Huotter, gardener to Lord Durham; and Mr. Parker, gardener to the Duke of Richmond.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for Temperature (Accumulated), Rainfall, and Bright Sun. Rows list districts (0-13) and their corresponding weather data for the week ending June 13, 1896.

The districts indicated by number in the first column are the following:— 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; \*Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending June 13, is furnished from the Meteorological Office:—

"The weather was again fine and dry throughout the period at some of the Irish stations, but over England the earlier half of the week was cloudy and changeable, with heavy falls of rain, and occasional thunder and lightning, in most localities. Considerable falls of rain occurred also in some parts of Scotland.

"The temperature varied greatly, but was, upon the whole, in excess of the mean; in 'England, E.' the excess was as much as 5°. The highest of the maxima were registered on the 13th, when they varied from 83° in 'England, S.' and 82° in 'England, E.' to 77° in 'Scotland, E.' and 'Ireland, S.' and to 76° in 'Scotland, W.' The lowest of the minima were recorded during the earlier part of the week, and ranged from 40° in 'Scotland, W.' and 42° in 'Ireland,' to 49° in 'England, E.' and to 53° in the 'Channel Islands.'

"The rainfall varied greatly in different districts. It was less than the mean in Ireland, the north and west of Scotland, and over the north of England, and just equal to the normal in 'England, S.W.' Elsewhere, there was an excess, that over the south and east of England being very large.

"The bright sunshine was more than the mean in 'England, E.' and over Ireland, but less in all other districts. The percentage of the possible duration ranged from 5 in the 'Channel Islands,' and 45 in 'England, E.' to 27 in the 'Midland Counties,' 22 in 'England, N.E.' and 14 in 'Scotland, E.'"

MARKETS.

COVENT GARDEN, JUNE 18.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing prices for various plants in pots such as Adiantum, Aspidistra, Calceolaria, etc., with columns for s. d. s. d.

Bedding Plants in variety.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing prices for cut flowers such as Arums, Bouvardias, Carnations, etc., with columns for s. d. s. d.

ORCHID-BLOOM in variety.

Table listing prices for orchid blooms such as Arums, Bouvardias, Carnations, etc., with columns for s. d. s. d.

VEGETABLES.—AVERAGE WHOLESALE PRICES.

Table listing prices for various vegetables such as Beans, Broad, Cabbages, etc., with columns for s. d. s. d.

NEW POTATOS.

MARKET very firm, with tendency to higher prices. Supplies not heavy. J. B. Thomas.

SEEDS.

LONDON: June 17. — Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's seed market presented a lifeless and uninteresting appearance. At this season, there are, of course, but few sowing wants to be satisfied, whilst no speculative movement of any importance has yet developed itself. Some small orders, however, still come to hand for Turcs, Lucerne, Sainfoin, &c. The prices demanded for new French Trifolium are regarded as prohibitory. There is no change in either Mustard or Rape seed. Canary seed is now obtainable at record low figures. Hemp seed is steady. Peas and Haricots command Monday's quotations.

FRUIT AND VEGETABLES.

BOROUGH: June 16.—Quotations:—Spinach, 1s. 6d. 2s. 6d. per bushel; Rhubarb, 1s. 6d. to 2s. 3d. per dozen bunches; Spring Onions, 1s. 6d. to 2s. per dozen bunches; Tasmanian Apples, 7s. to 10s. per case.

SPITALFIELDS: June 16.—Quotations:—Cabbages, 1s. to 2s. per tally; Onions, 1s. to 1s. 6d. per dozen bunches; Leeks, 1s. to 1s. 6d. per dozen; Mint, 2s. to 3s. per dozen bunches; Parsley, 2s. to 3s. do.; Lettuce, 6d. to 1s. per score; Beetroot, 1s. 6d. to 2s. per bushel; Peas, 3s. 6d. to 4s. per bag; Horseradish, 1s. 6d. to 2s. per bundle; Gooseberries, 2s. 6d. to 3s. per bushel; Tomatoes, English, 5d. to 6d. per pound.

STRATFORD: June 17.—Cabbages have been a very slow trade, supply in excess of demand. Fair trade done in all other vegetables and fruit. Quotations:—Cabbages, 1s. to 3s. per tally; Cauliflowers, 9d. to 2s. per dozen; do., 3s. to 10s. per tally; Beetroot, 6d. to 8d. per dozen; Horseradish, 2s. to 2s. 6d. per bundle; Parsley, 1s. to 1s. 6d. per dozen; Rhubarb, field, 1s. 6d. to 2s. per dozen Leeks, 1s. 6d. to 2s. per dozen; Spring Onions, 1s. to 1s. 6d. per dozen; Salad, 1s. 6d. to 2s. per pun net; frame Cucumbers, 1s. 6d. to 3s. 3d. per dozen Asparagus, 6d. to 1s. per 100 heads; Green Peas, 1s. 6d. to 2s. 6d. per sieve; do., 2s. to 6s. per bag; Tomatoes, 5d. to 6d. per lb., Guernsey; ditto, 5d. to 7d. per lb., English; Gooseberries, 2s. to 2s. 6d. per half-sieve; Strawberries, 2s. 3d. 3s. 6d. per peck; Turnips, 1s. to 2s. per dozen bunches; Carrots, bunches, 1s. 3d. to 2s. 6d. do.; Mangolds, 10s. to 15s. per ton; Onions, Egyptian, 90s. to 100s. per ton.

FARRINGTON: June 18.—Quotations:—Asparagus, 12s. per dozen; Cucumbers, 2s. 6d. do.; Mushrooms, 8d. per pound; Tomatoes, English, 6s. per dozen pounds; Carrots, 4s. to 6s. per dozen bunches; Turnips, 4s. do.; Marrows, 12s. per dozen; Spinach, 3s. per bushel; Mint, 3s. per dozen bunches; Parsley, 3s. do.; Peas, 2s. 6d. per bushel; do., best Blues, 3s. do.; Strawberries, 8s. per dozen punnets; double baskets, 1s. 6d. each; Cherries, English, black, 10s. per half-bushel; do., white, 9s. do.; Gooseberries, 3s. do.; Pine-apples, 3s. to 3s. 6d. each (about 6 lb.).

ENQUIRY.

"He that questioneth much shall learn much."—Bacon. "J. A." enquires if it is a fact that a Rose will not live side by side with a Honeysuckle—say, on an arch? We have had ourselves a Honeysuckle and a Gloire de Dijon on the same arch for some years. The Honeysuckle grows faster and so encroaches on the Rose, but that is easily remedied.

CARNATIONS: W. H. Sporting in Carnations is very common. It is probably due to a reversion, or "harking back" to a former state.

CAULIFLOWER ROOTS EATEN: J. S. Most likely the work of a weevil.

CORRECTION: Mr. R. L. Harrow desires to say that Primula Reidii is not a vigorous grower, as was stated in our last issue, and that very few plants are now to be found in the kingdom.

CUCUMBER FRUITS DECAYING: C. W. H. There is evidence of gummy, but you should send roots of the plants for investigation and some particulars of the sort of cultivation adopted.

DIOSPYROS VIRGINIANA: W. J. P. The species is the Date Plum or Persimmon, a native of the warmer parts of the United States of America. The fruit is an inch or more in diameter, nearly round, and of a yellowish-orange colour, and it is only eatable when blotted or softened by the action of frost. You could get plants and seeds in quantity from the American nurseries, and in small quantity, probably, from Mr. W. Bull, nurseryman, Chelsea, S.W. It is too tender a plant for cultivation out-of-doors in this country.

GARDENERS' ORPHAN FUND: The sum of £1 has been received from F. P., gr. to the Earl of D., in acknowledgment of services rendered by the Gardeners' Chronicle in naming Orchids. The amount has been forwarded to the Gardeners' Orphan Fund.

IVY-LEAVED PELARGONIUM: B. B. The leaves appear to have been punctured on the lower surface by some insect, but what insect we are unable to tell you. Wash the plants with quassia-water; it may render the foliage distasteful to the insects.

**MELON:** *J. C. P.* We do not believe the appearance of one side of the fruit to be due to disease, but to exposure to a very hot sun, perhaps without much ventilation at the time. It is not in the nature of a Melon to be elevated above the foliage as gardeners manage it, but to be partially hidden by the foliage, the shade from which is perpetually shifting. In warmer climates than ours, Melons and Cucurbits of many kinds are grown in the shade of Maize, Vines, &c.

**NAMES OF PLANTS:** *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*F. R., Herts.* 1, *Epidendrum alatum*; 2, *Ocuidium divaricatum*; 3, *Maxillaria ochroleuca.*—*No Name.* 1, *Oneidium pulvinatum*; 2, *Oneidium longipes*; 3, *Maxillaria luteo-alba*; 4, *Vanda Denisouiana*; 5, *Cattleya Mossiae*; 6, a very good *Odontoglossum crispum guttatum.*—*W. S. L. Lonicera Regehana.*—*Lanc.* *Gypsophila paniculata.* *E. H. Medicago sativa, Lucerna.*—*J. S. Montrose.* *Escallonia macrantha* and *Crataegus pyracantha.*—*N. J.* 1, *Philadelphus coronarius* var.; 2, *Weigela rosea* var.; 3, *Viburnum plicatum*; 4, *Philadelphus coronarius*, double; 5, *Philadelphus coronarius* var.; 6, *Kolreuteria paniculata.*—*E. M. I.* *Phlox fruticosa*; 2, *Lonicera Ledebourii.*—*W. D.* next week. No. 7 is the Feather Hyacinth, a variety of *Hyacinthus comosus*, in which the flower-stalks become coloured, whilst the flowers remain undeveloped.—*K. Budge.* Many thanks. We do not think the leaf you send can be that of *V. Coignette.*—*M. H. H.* *Justicia carnea.*—*A. M.* 1, *Ophrys apifera*. 2, *Philadelphus coronarius*. 3, *Spiraea opulifolia*. 4, *Spiraea bracteata.*—*H. S.* *Dendrobium Fierdii.*

**PALM-LEAF AND ELECTRIC-LIGHTING WIRE:** *J. W. W. & Son.* Such injuries as those you mention, but of which there seemed to be no trace on the portion of leaf sent, are matters of which, as yet, we have no acquaintance. It may have occurred in the manner you relate, but as the electric wires are encased in non-conducting material, the points of contact with the plant must have been unprotected.

**PANSIES:** *W. C.* We think highly of your seedlings, but there are now so many that comparison is difficult. The Pink is very pretty, and worth propagating.—*F. W. D.* We still think that the insalubrity of the town is against their cultivation. It is almost equally so in London, for unless wintered under glass, *Violas* and *Pansies* dwindle away, and disappear in about a twelvemonth.

**PRICES OF NURSERY STOCK:** *A. B. T. H.* Without seeing the plants no one can estimate their selling value. Consult a trade valuer, or get a nurseryman friend to value them for you.

**ROYAL PELARGONIUM, PERSIMMON:** We are desired by Messrs. Cannell & Sons to state that this plant, although staged by them at the last Royal Horticultural Society meeting at the Drill Hall, James Street, was really exhibited by Mr. P. Ladds, Swanley.

**TOMATOS:** *E. H.* The spot is due to a fungus often described and figured in these columns. None of the circumstances you mention would cause the disease.

**TREE FERNS.**—In answer to a recent enquiry in these columns, Mr. W. E. Broadway, of the Botanic Gardens, Grenada, British West Indies, writes that he has plants of *Cyathea arborea*, *Alsophila infestans*, *A. aspera*, *Hemitelia grandifolia*, and several others.

**COMMUNICATIONS RECEIVED.**—*B. Corte.*—*H. J. H.*—*E. G.*—*A. D.*—*J. Heathman & Co.*—*Journal of Horticulture.*—*A. J. R.*—*O. G.*—*J. McL.*—*R. A. R.*—*F. W. D.*—*W. Miller*—*W. J. P.*—*A. O.*—*U. D.*—*M. T.*—*A. P.*—*J. W.*—*R. L. H.*—*A. D.*—*D. R. W.*—*A. D. W.*—*D. T. F.*—*G. C.*—*Sir C. W. S.*—*H. de V.*—*H. J. W.*, Florida.—*J. W.*—*A. H. D.*

**MARRIED.**—At Trinity Church, Bergen Point, New Jersey, U.S.A., on Wednesday June 3, LEONARD BARRON, son of Mr. A. F. Barron of Chiswick, to EFFIE MAUD ROBINSON.

**CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."**  
**IMPORTANT TO ADVERTISERS.**—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper, increased to the extent of more than 90 per cent., and that it continues to increase weekly.  
 Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal libraries.

**NATIVE GUANO.**—BEST AND CHEAPEST MANURE FOR GARDEN USE. Price £3 10s. per ton, in bags. Lots under 10cwt., 4s. per cwt.; 1 cwt. sample bag sent carriage paid to any station in England, on receipt of P. O. for 6s. Extracts from 20th Annual Collection of Reports:—

**NATIVE GUANO FOR POTATOS, VEGETABLES, &c.**  
*B. LEE & SON, Market Gardeners, Burnham.*—Used for three years for Vegetables, Strawberries, Cucumbers, Tomatos, and other Market Garden Crops, and it has "given great satisfaction for all crops." *T. REASON, Gardener to Lord Windsor.*—Used for several years for Potatos and general Kitchen Garden Crops. Results: "Good. A capital manure."

**NATIVE GUANO FOR FRUIT, ROSES, TOMATOS, &c.**  
*G. STOWARD, Gardener to Sir A. T. Watson, Reigate.*—"I have used your Guano for five years, and can bear testimony to its great value for fruit growing." *C. ROUSE, Mazing Park Gardens, Waltham Cross.*—Used for Tomatos, Cucumbers, Chrysanthemums, and Roses. Results: "A marked improvement wherever used. A good and cheap manure."

Orders to the **NATIVE GUANO CO., Ltd.**, 29, New Bridge Street, Blackfriars, London, where pamphlets of testimonials, &c., may be obtained. AGENTS WANTED.

Under the Sanction of the Permanent Nitrate Committee.  
 TO GARDENERS (Amateur and Professional).  
 COMPETITORS at HORTICULTURAL SHOWS, and OTHERS.

**NITRATE OF SODA,** the indispensable nitrogenous fertiliser, may now be had of Seedsmen in Town or Country. Warranted of standard purity. Price in tins, containing 4 lb., with full directions for use, ONE SHILLING.

**BEESON'S MANURE, SHEFFIELD.**—For Vines, Plants, and Vegetables. Sold with a Guaranteed Analysis. Has stood the test of the principal growers for over 20 years, and is admitted to be the Best for all Horticultural Purposes. In boxes, 1s. and 2s. 6d.; bags, 50 lb., 8s.; 1 cwt., 15s. May be obtained through any Seedsmen; or, direct (bags only), carriage paid, and liberal discount for cash with trial order, from **W. H. BEESON, SHEFFIELD.** Pure Crushed Bones, all sizes, and other Fertilisers at market prices.

**THOMSON'S VINE AND PLANT MANURE.**

The very best for all purposes. The result of many years' experience. Largely used both at home and abroad.

Agent for London:—**J. GEORGE**, 14, Redgrave Road, Putney, S.W.  
 Agent for Channel Islands:—**J. H. PARSONS**, Market Place, Guernsey.  
 Sole Makers:—**WM. THOMSON AND SONS, LTD.**, Tweed Vineyard, Clovenfords, N.B.

Price Lists and Testimonials on application. Analysis sent with orders of ½-cwt. and upwards.  
**SOLD BY ALL SEEDSMEN.**

**STANDEN'S MANURE.**

Established over 30 Years. Exceeds all others in General Fertilising Properties and Staying Powers.

It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell. The highly-fertilising properties of this Manure render its money value, in comparison with other Manures, at least double; and users will find that very small quantities will produce favourable and lasting results.

## ROBERT WARNER & CO.'S NEW PATENT WINDMILLS.

Saves Coal, Pumps Water, Grinds Corn, Cuts Chaff, &c.

Supports can be made in Teak, Iron, or Steel, for Hot Climates.

One of Robert Warner & Co.'s Patent Windmills will be erected and worked at the Royal Agri. Show, Leicester.

Prices from £17, including Pump and Timber Supports.

May 27, 1893, The Dell, Englefield Green, Surrey.

ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.O.

Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail geared Windmill, on 40 feet timber, working a set of 3 in. X 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,

H. BALLANTINE, Head Gardener to Baron Schröder.  
R. WARNER & Co. have made and erected a similar Mill and set of Pumps for Lord Northbourne.

NUMEROUS OTHER TESTIMONIALS ON APPLICATION TO  
27, JEWIN CRESCENT, CRIPPLEGATE, LONDON, E.C.  
Engineering Works, WALTON-ON-THE-NAZE, ESSEX.

AND FOR ALL  
GLASS STRUCTURES  
THAT REQUIRE  
SHADING.

It combines efficiency with appearance, convenience with economy, and its effects are lasting, while it is easily removed when necessary with hot water. It can be supplied either pale green or grey.

The public are warned against spurious imitations which are offered them, through the success obtained for many years by Elliott's "Summer Cloud" Shading, and they should see that in ordering they get the "Summer Cloud," which is the only original and bona fide article, with the Trade Mark on each packet.

Sold in pkts., 1s. each, and in bags, 7 lb., 10s. 6d.; 14 lb. 20s.

To be had of the SEED and NURSERY TRADE generally.  
Manufacturers: CORRY AND CO., Ltd., London.

**FOREMAN.**—N. HUTTON, Gardener, Brandfold, Goudhurst, Kent, will be pleased to highly recommend GEORGE WHITE to any Gardener requiring a thorough practical and trustworthy man. Well up in Plant and Fruit-growing.

**FOREMAN, or JOURNEYMAN (FIRST).**—Age 25; eleven and a half years' experience Inside and Out, including Gerhids, Chrysanthemums, and House Decoration. Good references.—F. WICKENS, Seagrove, Seaview, Isle-of-Wight.

**JOURNEYMAN, in good Establishment.**—Age 19; one year in last situation, four previous. Good recommendations.—J. STONARD, Duchesse Cottage, Pirbright, near Woking.

**JOURNEYMAN;** age 20.—W. REDDEN, 70, Byron Street, Bowdon, Altrincham, Cheshire, requires situation as above. Strong and active. Well recommended by Mr. COATES, Head Gardener, Darball Hall, Wensford.

**JOURNEYMAN, Inside and Out.**—Age 22; good character. Three years in present place; five previous.—J. BEAUCHAMP, Cowesfield Gardens, Salisbury.

**JOURNEYMAN.**—Inside and Out; age 22. Life experience; good references.—F., 2, Burrell Terrace, Winchmore Hill, Middlesex.

**JOURNEYMAN (FIRST).**—Age 23; seven years' experience. Can be highly recommended; over two years in last situation. Good references from previous employers. Botchy preferred.—W. ABRAHAM, 8, Kelsey Park Road, Beckenham, Kent.

**JOURNEYMAN, in the Houses, under Foreman.**—Age 21; six years' experience. Good references. Disengaged.—HENRY SKITT, Providence Grove, Upper Pulley, Shrewsbury.

**IMPROVER, Inside, or Inside and Out, in Nursery or Private Establishment.**—Age 18; good character; disengaged when suited.—CHARLES BACON, Cranford Hall, Saxmundham, Suffolk.

**IMPROVER.**—Age 17½; over three years' good character in present place. Within 60 miles preferred. Abstainer.—W. CAUNDELL, Wohlgelegen, Bournemouth.

**IMPROVER, or GARDENER (UNDER).**—A young Man (age 2) seeks situation as above. Four years and nine months' experience, Inside and Out. Nine years' good character.—W. COOK, Hanslope, Bucks.

**IMPROVER, in Gentleman's garden.**—Young Man, age 22, seeks situation as above. Willing and obliging; good character from present situation.—T. IRISH, Harcombe, near Sidmouth, Devon.

**IMPROVER in Garden;** five years' good character.—H. DEAL, Bulmer Lodge, near Sudbury.

**IMPROVER.**—Age 19; seeks situation Inside, or Inside and Out, in Nursery or Private Establishment. Five years' experience; good references. Disengaged when suited.—F. P., 41, Wellington Street, Strand, W.C.

**APPRENTICE.**—Wanted to Apprentice a well-educated youth, age 15½, to Gardening. To live indoors preferred. Apply, JOHN PAULSON, George Street, Biddings, near Alfreton, Derbyshire.

**TO GARDENERS.**—Young man, age 20, seeks situation in the Houses; eight years' experience. Good references.—R. CLARKE, Hope Cottages, St. John's Road, Earlswood, Surrey.

**TO NURSERYMEN.**—Situation wanted by a young Man (age 20). Six years' experience in Palms and soft-wooded stuff. Good references.—G. R., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

**TO NURSERYMEN.**—Young Man, age 22, experienced in general routine of Market Work. Quick at Potting, Watering, and Tying.—ABSTAINER, 41, Wellington Street, Strand, W.C.

**TO NURSERYMEN.**—Young man (age 22) seeks situation as GROWER, Cucumbers, Tomatoes, Chrysanthemums, and Mushrooms. Eight years' experience. Good references.—F. E., 47, Dunstan's Road, East Dulwich, S.E.

**TO NURSERYMEN.**—Young man (age 24), seeks situation as GROWER. Well up in Cucumbers, Tomatoes, Chrysanthemums, and Mushrooms. Twelve years' experience. Good references. Disengaged 20th.—L. LUXFORD, 47, Dunstan's Road, East Dulwich, London, S.E.

**NURSERYMAN.**—A Dutchman from Boskoop, at present working here, is looking for a situation. Acquainted with both Indoor and Outdoor Work.—Letters addressed A. H., 41, Wellington Street, Strand, London, W.C.

**TO NURSERYMEN.**—Situation wanted, well up in Palms, Ferns, and Soft-wooded Stuff; age 24; ten years' experience in London Market Nurseries. Good references.—C. P., 41, Wellington Street, Strand, W.C.

**TO NURSERYMEN.**—A young Man (age 19) seeks permanent situation in General Nursery; five years' good Nursery experience, Inside and Out. Good character. Abstainer. Cut Flowers. State wages.—W. WEST, 26, Devonshire Street, Brighton, Sussex.

**SHOPMAN (HEAD), or MANAGER,** with the idea of becoming Partner, provided the business is suitable. Situation wanted, as above, by a middle-aged man, who has a thorough knowledge of the Seed Trade in all its branches.—State all particulars to Z., care of Messrs. Hurst & Son, 152, Houndsditch, London, E.

**DICKSONS, Chester.**—Can recommend a young Man as Ledger, Invoice, or General CLERK. Six years' experience.

**TO FLORISTS.**—Lady, young, seeks situation as IMPROVER in Florist's Shop.—A. S., 310, London Road, Thornton Heath.

**TO FLORISTS.**—Young lady seeks situation in a good Florists, as SECOND HAND. Has had City experience. Knowledge of Book-keeping.—E. HOPFROFF, Langton Green, Tunbridge Wells.

**TO FLORISTS.**—Situation wanted by a young Lady, in Florist's Trade. Good experience in Bouquets, Wreaths, &c. Good character.—FLORIST, 60, St. John's Road, Oxford.

BY SPECIAL APPOINTMENT TO H.R.H. THE PRINCE OF WALES.

 Renewal of Range of 22 Plant Houses, in Teak-wood, at Royal Botanic Gardens, Edinburgh.  
 Range of Vineries, in Teak-wood, at Linton Park, Maidstone, Kent.  
 Range of Hot-houses, in Teak-wood, at St. Marnocks, Malahide, Dublin.  
 Range of Hothouses at Waterpark, Castle Connel, Ireland.

### WATER SUPPLY!! — WATER SUPPLY!!!

SEND FOR ILLUSTRATED LIST, No. 27, OF

## JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

For RAISING WATER for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms, &c.

No cost for Motive Power, which is obtained from a Stream of Water passing through the Ram. No Oiling or Packing required. Made in sizes to raise from 300 to 400,000 gallons per day. Will force to a height of 800 feet.

FIG. A.—This ram lifts part of the same water that works it. (Engraved from Photo. of Ram which raises 250,000 gallons per day of 24 hours to medium heights, with good working fall.)

This View represents a Ram worked by impure river water, whilst pumping pure water from a well or spring and forcing it to a small reservoir on the hill, at an elevation of 532 ft., and a distance of one mile, from which reservoir the water is gravitated for fire-extinguishing and general requirements of mansion, stables, farm, and village.

FIG. B.—This Ram, whilst worked by a stream of impure water, will pump clean water from a well or spring.

### TESTIMONIALS.

From T. FERNYHOUGH, Esq., Agent to the RIGHT HON. LORD HINDLIPI, Braaley, Ashbourne, Derby. March 17, 1894.

DEAR SIR,— Referring to the two Patent "B" Rams you started six months ago for the Right Hon. Lord Hindlip, on the Alsop-en-le-Dale Estate, I am glad to congratulate you on the success of your attempt to raise the necessary supply of water under conditions so difficult, the height to raise the water being more than 63 times that of the working fall. The Rams are worked by water from the River Dove, with the small working fall of 8 ft. 3 ins., and issuing from the rocky bank close by is a copious stream of pure spring water, 3000 gallons per day of which the Rams force to a reservoir three-quarters of a mile distant, and at the extraordinary height of 523 ft. above the Rams. The water is then gravitated from the reservoir to the several farms and houses on the estate, giving an ample supply to each, and still leaving a good overflow at the reservoir.

I am glad to add that the Rams lift more water than you promised, and seem to work with great ease and smoothness, notwithstanding the great elevation they force to.—Yours faithfully, T. FERNYHOUGH.

From the RIGHT HON. THE EARL OF HARROWBY, 44, Grosvenor Square, London. February 21, 1893.

SIR,— I have pleasure in stating that the two Hydraulic Rams which you supplied and fixed for me last autumn, at Sandoe, have proved so far most successful, and that the work gives every promise of durability, while the economy, compared with the former much smaller and intermittent supply by steam-pump, will be considerable.

With a fall of about 14 ft. from a previously-existing mill-pool, the Rams supply reservoirs 168 ft. above the brook whence the water is forced, through pipes 1½ miles in length. They sent up, as long as I required it, about 41,000 gallons per day. I now generally work the two Rams alternately (for a fortnight or so each), but can at any time work the two together, if the full supply of 41,000 gallons should be needed.

The business of this somewhat complicated water-supply was conducted by you with singular promptness and punctuality; and no local difficulties arose in the execution of the work, owing to the excellent and efficient men whom you sent from your works at Accrington.—I am, Sir, your very obedient Servant, HARROWBY

From T. DYNE STEEL, Esq., M.Inst.C.E., Paat President South Wales Inst. of Engineers, Bank Chambers, Newport, Mon. April 24, 1891.

DEAR SIR,— In September of last year I applied to you for a Hydraulic Ram for the purposes of the Usk Waterworks, to be capable of raising 27,000 gallons per day, a height of 127 ft. with a working fall of driving water of 27 ft., and on your guaranteeing that performance, I gave you an order for the Ram. The machine you supplied has now been put to work, and I have much satisfaction in saying that it far and away exceeds in its performance my most sanguine expectations, and possibly yours also. I have just completed a series of exhaustive tests, with the following results:—Working fall of driving water, 30 ft.; vertical height raised, 127 ft.; length of rising main, 850 ft., from Ram to outflow; length of supply pipe 200 ft.; gallons per hour raised, 1,512; driving water used per hour, 8,189 gallons, showing the remarkable and gratifying result of 83 per cent. of efficiency. The tests were carefully made and repeated, the water measured and levels properly taken. Several trials were made, and I shall be glad to give any engineer interested in the subject facilities for repeating the tests at the spot. I may here state that for the rising main I used a large diameter of pipe, in order to reduce friction, with excellent effect.—Yours faithfully, T. DYNE STEEL.

From MARTIN CURTLER, Esq., Agent to the Right Hon. LADY NORTHWICK, Sausome Place, Worcester. Feb. 18, 1895.

DEAR SIR,— I have great pleasure in informing you that the Hydraulic Ram which you put in for the Right Hon. Lady Northwick, at Northwick Park, last year, has worked, and is working, most satisfactorily. The water, as you know, had to be raised to the height of nearly 400 ft., with 1,900 yards of rising main pipe, to a large tank on the top of a hill, in order to supply several farms on the estate with water for gravitation.

The supply to the tank is most ample, and there is an adequate overflow left below the Ram. Altogether the work is a very great success.—Yours faithfully, MARTIN CURTLER.

JOHN BLAKE, Oxford Street Works, ACCRINGTON, LANCASHIRE.

AND SIXPENCE FOR EVERY ADDITIONAL LINE.  
 If set across two Columns, the lowest charge will be 20s.  
 If set across three Columns the lowest charge will be 30s.  
 Page, 2s; Half Page, 4s 10s.; Column, 4s.

**GARDENERS AND OTHERS WANTING SITUATIONS.**  
 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

**POSITION.**—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

**NOTICE TO ADVERTISERS.**—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. G. COVE, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.  
**All Advertisements should be addressed to the PUBLISHER.**  
**Publishing Office and Office for Advertisements,**  
 41, WELLINGTON STREET, STRAND, W.C.

### SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. G. COVE.  
 Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

Under the sanction of the Permanent Nitrate Committee.

TO GARDENERS (Amateur and Professional).  
COMPETITORS at HORTICULTURAL SHOWS, and OTHERS.

**NITRATE OF SODA**, the indispensable nitrogeous fertiliser, may now be had of Seedsmen in Town or Country. Warranted of standard purity.  
Price in tins, containing 4 lb., with full directions for use, ONE SHILLING.

THE **Gardeners' Chronicle.**  
SATURDAY, JUNE 27, 1896.

**WILLIAM ROXBURGH.**

THE fifth volume of the *Annals of the Royal Botanic Garden, Calcutta*, contains a portrait of William Roxburgh, author of the *Flora Indica*, together with a brief memoir by Dr. G. King, the present Superintendent. William Roxburgh was born at Underwood in the parish of Craigie, in Ayrshire, on June 3, 1751, and was educated at the parochial school, after which he went to the University of Edinburgh, and having attended as many of the medical classes there as were then required for a licence to practice as a surgeon's mate, he received an appointment in that capacity on one of the Honourable East India Company's ships. After making several voyages, and completing his medical studies during the intervals spent at home, he accepted an appointment in the same company's Madras establishment, where he arrived in 1776. Here he made the acquaintance of Dr. Koenig, who went to India some eight years previously, as physician and naturalist to the Dutch Settlement in the Carnatic, but afterwards entered the service of the Nawab of Arcot. During the latter period he met Roxburgh, and the daily intercourse of two such men in an unfamiliar country, where almost every plant was new to them, must have afforded a mutual stimulus to work. The researches of the two friends into the botanical sources of the indigenous economic products of the Carnatic impressed the Madras Government so favourably that from 1778 they made Koenig a monthly allowance to enable him to extend his enquiries to Siam and the Straits of Malacca, and two years later he was formally admitted into the company's service. Koenig died of dysentery in June, 1785, and was succeeded as Government Botanist by Dr. P. Russell, who held the office but a short time, and was in turn succeeded by Roxburgh. In May, 1793, Colonel Robert Kyd, the founder and first superintendent of the Calcutta Botanic Garden, died, and Roxburgh was appointed to succeed him, taking charge in the November following. Kyd had never lived in the garden, there being no suitable house, but Roxburgh decided to live there, and at once set about building a house, which exceeded the amount allotted by the company by a considerable sum, and the accountant-general refused to pay the excess.

Until this period Roxburgh's service was confined to the Northern Circars (he was presumably attached to a regiment), and a good deal of it was at Samulcotta, a small station on the edge of a hilly region, about 7 miles from the town of Coconada. For years it had been

the practice, both of Koenig and of Roxburgh, to describe and make drawings of every plant they met, and the former had transmitted many specimens to Europe, which had been published in various works, but the latter does not appear to have done so, or to have published anything. Between 1791 and 1794, however, he transmitted to the Court of Directors in London descriptions and figures of no fewer than 500 species, which were placed in the hands of Sir Joseph Banks, who selected 300 of them, which were published, at the Company's expense, in three large folio volumes, under the title, *The Plants of the Coast of Coromandel*. This was Roxburgh's earliest book; the first part appeared in 1795, but the last not until 1819. [A copy of this fine work was presented to the Lindley Library by Her Majesty the Queen.]

Roxburgh appears to have arrived at Calcutta with a constitution impaired by hard botanical work in the feverish jungles of the Carnatic, for within four years after his transfer, he was obliged to make a voyage home for the re-establishment of his health. This was in 1797, and during this visit to Scotland he took the degree of Doctor of Medicine at the University of Edinburgh. He returned to Calcutta in 1799, but in 1805 he again returned to England on account of his health, residing at Chelsea. About 1808 he returned for the last time, but during the hot season of 1813 his health completely broke down, and he started on a sea-voyage to the Cape of Good Hope. His health, however, not improving sufficiently, he extended his voyage to St. Helena, and finally to England. Shortly after arriving he proceeded to Edinburgh, where he died on February 18, 1815, and was buried in the Greyfriars churchyard there, in the tomb of the Boswells of Auchinloch, his third wife being a daughter of that house.

Estimated by the number of elaborated botanical materials which he left behind him, Roxburgh's life at Calcutta, Dr. King remarks, must have been one of continued hard work, as when he quitted India for the last time, in 1813, he left under the charge of Dr. Carey not only the MSS. of his *Hortus Bengalensis* and of his *Flora Indica*, but also no fewer than 2553 life-sized drawings of Indian plants, with figures of excellent analyses of their flowers, which had doubtless been made by himself. The majority of these drawings are of plants described in his *Flora*, so that between these and his descriptions there is generally little room for doubt as to what Roxburgh's species are.

Roxburgh had several copies made of the MSS. of his *Flora Indica*, one of which he took home with him, intending to occupy the remainder of his life in amending it, in the light of the most recent views of systematic botanists in Europe, and in passing it through the press; but this was prevented by his ill-health and death so soon after his return. A second copy he left with his friend, the Rev. Dr. Carey, a missionary and an accomplished botanist, who was placed in charge of the Calcutta garden when Roxburgh left, and until relieved by Dr. Buchanan-Hamilton. Roxburgh had not long left India before Dr. Carey passed the *Hortus Bengalensis* through the press, and secured for his absent and sick friend the priority for many of his species. At the end of Buchanan-Hamilton's short tenure of office, Dr. Wallich, then surgeon to the Danish Settlement at Serampore, and a young botanist of much promise, was appointed superintendent of the Calcutta Garden, and employed his early years of office in making extensive collections in Nepal, and subsequently in the Straits of Malacca, and other parts of India not visited by Roxburgh. It was decided that descriptions of these collections should be incorporated with Roxburgh's MSS., and the whole published under the joint supervision of Carey and Wallich. The first volume appeared in 1820, and contained but few of Wallich's interpolations; but the second, which appeared four years later, contained many, and the decision to include Wallich's novelties was the cause of failure of the whole project, for the latter's

capacities for collecting were so far in excess of his leisure for description and classification that he had to abandon the idea of carrying on his share of the work, which thus ended prematurely with the second volume. Eight more years having elapsed, the author's two sons, Captains Bruce and James Roxburgh, neither of whom was a botanist, determined to print, at their own expense, their father's MSS., exactly as he had left it, which was done under the editorship of the venerable Carey, and the work was published, in three octavo volumes, at Serampore, in 1832.

The excellence of Roxburgh's *Flora Indica* as a botanical work has long been acknowledged, and Dr. King remarks that his descriptions are for the most part so accurate and graphic that while identifying a plant by it one can feel quite certain when he has got the very species that its author meant. His ideas of affinity are in the highest degree sagacious, and had he lived a few decades later it would have doubtless been as successfully fashioned on the natural system as it was on the Linnean. As regards economic botany it is a perfect mine of wealth, and so much of his attention was given to enquiries into indigenous vegetable products, and so greatly were his re-earches esteemed in England, that on no less than three occasions were gold medals awarded to him by the Society of Arts.

Although there can be little doubt that during his long Indian career of thirty-eight years he must have made large collections of plants, comparatively few can now be traced in herbaria. His earlier ones in the Carnatic were destroyed by an inundation, but during the twenty years of his life at Calcutta he must have accumulated large quantities of dried plants, yet none now exist in the herbarium there. Griffith, however, asserts in his Report on the Calcutta garden, written while he acted for Dr. Wallich in 1834, that the latter had carried off all Roxburgh's collections from Calcutta, and that they had (without any distinguishing mark) formed part of the great herbarium of Indian plants distributed to the chief scientific institutions in Europe, at the expense of the East India Company, under Dr. Wallich's direction. A few of Roxburgh's plants are to be found at Edinburgh, Kew, and the British Museum, and there may be some on the Continent; but the majority cannot now be traced, though this is greatly compensated for by the series of drawings left at Calcutta, of which copies were made at the expense of the late Sir William Hooker, and are now deposited at Kew.

Contemporary with Roxburgh in India during the end of the last and beginning of the present century were many keen botanists, all of whom probably received some stimulus from the ardour of Koenig, who appears to have been in India a sort of an *avatar* of Linneus. But Roxburgh was the only one of the group who attempted to give an account of any considerable number of Indian plants in the form of a *Flora*, and for this reason he has been called the "Father of Indian Botany," and "the Linneus of India." He was a member of the Asiatic Society of Bengal, a Fellow of the Linnean Society of London, of the Society of Arts, and of the Royal Society of Edinburgh. A list of Roxburgh's contribution to scientific journals, eighteen in number, is appended to this interesting memoir. R. A. R.

## NEW OR NOTEWORTHY PLANTS.

### A NEW PHILADELPHUS, P. COULTERI.

THIS beautiful and almost perfectly-hardy flowering shrub is a native of North Mexico, and though well known in America (where Professor Sargent figured it in 1888, on plate 40, p. 232, of his volume of *Garden and Forest* for that year), it has only recently been introduced into European gardens by M. Lemoine of Nancy, from whom I received it about three years ago, and it is now blooming for the first time in my garden. It differs from all other members of its large family known to me save *P. mexicanus* in the important fact of being evergreen, whereas all

the others, with the one exception named, are quite deciduous. It produces its flowers singly on the ends of the lateral spurs of last year's growth. The flowers are large, and of a fine solid texture, of a creamy-white, with the four petals well overlapping one another, and in shape are exactly similar to those of the comparatively well-known *P. mexicanus*, with the important difference and great additional beauty in colour of having a distinct rosy-purple flush, extending from the base of each petal, and forming the centre of the flower surrounding the bunch of golden stamens. So far as I know, this is the first and only instance of a second colour appearing in the flower of any of this profuse-blooming family of hardy shrubs, and this being so, it is all the more interesting and curious. I believe M. Lemoine has used this new Philadelphia for crossing with other varieties with a view to raising new hybrid forms, but none of his seedlings from these crosses has yet bloomed. W. E. Gumbleton, *Be grove, Queenstown, Ireland.*

## CORNUS KOUSA.

MESSRS. VEITCH & SONS kindly send us a specimen of this beautiful hardy Japanese shrub. The leaves are almost exactly like those of the common Dogwood of our hedges, but the flowers are borne on long, slender, stiff stalks, from the very tips of the shoots. The flowers themselves are inconspicuous, and in heads surrounded by four large, ovate acuminate, white bracts. The appearance is that of so many large stars projecting at loose intervals beyond the foliage, or like banners at the end of long poles. We cannot define the expression, but when we say the flower is characteristically Japanese, our meaning will, we think, be understood. It is nearly allied to *Cornus* (*Benthania*) *fragifera*, and was first figured and described as *Benthania japonica* in Siebold and Zuccarini's *Flora Japonica*, i., 38, t. 16.

## BERLIN.

### HORTICULTURE AT THE BERLIN EXHIBITION.

A PECULIAR interest attaches to the scientific section of the horticultural group, which occupies almost an entire house in its display. There is the great drug collection of Bruckner, Lampe & Co., a firm which has had a continued existence of more than 150 years. This collection for completeness can scarcely be excelled anywhere, and everything connected with the healing art that has been obtained from the vegetable kingdom during the last 150 years is here represented; and not alone recognised official drugs, but everything employed as home remedies, and in veterinary practice. Numerous drugs about which much was once expected, no less than others which notwithstanding their good properties are not to be found in the market, as for example Russian Kron Rhubarb, are to be found in this collection. It would occupy too much space to particularise, but it may be remarked that besides drugs, the firm exhibits a number of important medicinal plants in the living state, as well as drugs in common use in their original packages; for instance, a chest of rhubarb, another of opium, some leaden bottles enclosed in felt filled with oil of roses, &c.

Another exhibit of objects of general interest consists of diverse yeast cultivation shown by Dr. Lindner. It may be remarked at this point that it has been successfully proved that the bouquet of a wine is dependent on the yeast which arises from the fermenting juices of the Grape. A great number of wine yeasts are cultivated at the present day, and used in a wholesale manner, so that with their aid any desired bouquet can be given to wine. Since the practicability of this new method of dealing with wine has made its value apparent, further experiments have been made in the direction of employing wine yeasts in the fermentation of cider, and wines made from berries. These experiments have proved successful; and it is now possible, for

instance, to make a wine from cider which shall possess the peculiar bouquet of Rudesheimer wine.

As the employment of wine yeast has shown the further advantage of nearly always preventing a wine from becoming "sick," as a consequence of inducing fermentation with unsuitable yeast, these wine-yeast cultures become of the greatest importance to agricultural economists. Dr. Lindner exhibits quite a number of these clean yeast-cultures in gelatine, as

peculiar property of existing in different stages of their development on different host plants. Numerous species of cultivated plants are attacked by large numbers of species of fungi, and H. Sydow has now collected and arranged them systematically, according to the plants upon which they exist, and he has done this work with much thoroughness. He has, in carrying out this work, taken cognizance of the early as well as the adult stages of the fungus,

formation of a herbarium is a matter of considerable difficulty. But as a proof of what can be done with patience and care, I would direct attention to the extraordinarily rich and well-mounted Conifer herbarium of Herr Goetze, which includes all the species and varieties that are capable of living in the open air in Germany.

Other species of plants, as is well known, are also difficult to prepare as herbarium specimens for other

FIG. 135.—*CORNUS KOUSA* (*BENTHAMIA JAPONICA*): HARDY SHRUB; BRACTS WHITE. (SEE P. 782.)

well as injurious yeasts and microphotographs of the same.

Another exhibit of the fungus order is a very complete collection of diseases of cultivated plants caused by fungi. This is from Herr Sydow. The fungi cause very great injury to plants under cultivation, and, at the same time, they are so minute that the laity only observe them after enormous havoc has been committed. Some fungi, as is well known, have the

and he also exhibits drawings greatly magnified in many cases, the formation of a fungus method of growth in and upon a plant and its spores; and in that instructive manner he imparts precise knowledge and a clear understanding of the character of the disease.

A herbarium is very essential for the proper study of plants, but so many kinds lose their leaves in process of drying—for instance, the Conifers—that the

reasons; for instance, the Cactus, which, in consequence of their fleshy consistency and prickly stems, are found in herbariums in completely unrecognisable form. Professor Schumann exhibits a very interesting collection of Cactus in which this fault is not recognisable. He has simply allowed the Cactus plants to become dry, and in this process they have lost but little of their natural form, and permit of exact examination.

Among the other objects exhibited in this section which deserve to be specified are maps of the distribution of Ilex from the monographer of the genus, Dr. Loessner; an apparatus by Porschmann for testing the vitality of seeds, which can be heated by briquets of charcoal; numerous photographs of large size, by Mulert, of solitary plants and groups of plants from the Berlin Botanical Garden, including a picture of the Victoria Regia, 1 square metre in size; sketches of fruit tree-pruning by Kiehl, &c. A report is exhibited of the *Allgemeinen Deutschen Gärtnervereine*, concerning wages and the conditions of work in the gardens of Berlin and neighbourhood; the branches of the Verein; also the position of the sick clubs for gardeners in Germany, which are not alone of great interest to the gardener, but to the social reformer as well. One fact, by the way, may be here alluded to, viz., that of the 3000 young gardeners in and around Berlin 1000 of them are in the winter season without employment.

In the same hall are exhibited a number of garden plans and reliefs by various landscape-gardeners. Amongst the first-named are several which have received awards, and from which ideas may be obtained of the manner by which a landscape can be rendered attractive, and yet made to differ from others. The reliefs afford landscape gardeners a very efficient aid in displaying their plans, namely, when, as here, a relief is given of the original appearance of the ground, and alongside of it one showing the garden, &c., when the alterations are completed. *U. D.*

## FRANCE.

### HORTICULTURE IN THE NORTH OF FRANCE.

EARLY IN JUNE the Société Régionale de Lille held its monthly general meeting, which was largely attended in spite of the great heat.

The beauty of his exhibits on this occasion induced me to visit M. Vanden Heede's nurseries. I there noticed, among other plants in bloom, *Mitraria coccinea*, *Callistemon amœnum* (*Metrosideros albicans*), *Sprekelia formosissima* (*Amaryllis*, or Lily of St. Jacques), *Strelitzia reginae*, *Lilium Harrisii*, *Richardia aurata*, *Aristolochia triacaudata*, *Hypocyrta strigilloides*, many plants of *Cattleya Mossiae*, a pretty *Odontoglossum Pescatorei*, a new *Phyllocactus*, *Anthurium Scherzerianum atropurpureum*, *Impatiens Sultani violacea*, *Cypripedium Argus*, *Masdevallia Harryana*, *Grevillea alpestris*, *Nicotiana affinis fol. albo var.* (with, in the evening, a delicate perfume), *Saintpaulia ionantha*, Carnations, *Souvenir de la Malmaison*, *Rhododendron Maddenii*. In the open air were scented herbaceous Chinese *Pæonies*, Tea and hybrid *Roses*, *Iris germanica*, *sibirica*, *hispanica*, *anglica*, *Polemonium coeruleum*, *Heracleum giganteum*, and a large variety of herbaceous plants. *Ch. de B.*

### THE REPRODUCTION OF THE ORANGE FROM SEED.

In your issue of April 25, 1896 (p. 527), I notice Mr. C. Wolley Dod suggests that it is generally believed by gardeners that Orange trees raised from the seed of a sweet Orange produce bitter fruit unless grafted on to the sweet Orange tree. As I am somewhat familiar with Orange-growing in Florida, having spent several years here in studying the industry, it may not be out of place for me to give some notes regarding this.

#### SWEET ORANGE (*CITRUS AURANTIUM*).

The seed from the fruit of the sweet Orange, I think we may safely conclude, invariably produces sweet Oranges unless they are the results of hybridisation with some other species or variety. The evidence, however, is somewhat conflicting. The experiments of Gallezio, published in 1811, seem to show conclusively that the belief that they produce bitter fruit, which Mr. Dod suggests is quite generally held by gardeners, is erroneous. In his *Traité du Citrus*, Gallezio says, "I have during a long

series of years sown pips of sweet Oranges, taken sometimes from the natural tree, and sometimes from Oranges grafted on bitter Orange trees or Lemon trees. The result has always been trees bearing sweet fruit, and the same has been observed for more than sixty years by all gardeners of Finale. There is no instance of a bitter Orange tree from seed of sweet Oranges, nor of a sweet Orange from the seed of bitter Oranges. . . . In 1709, the Orange trees of Finale, having been killed by frost, the practice of raising sweet Orange trees from seed was introduced, and every one of these plants produced the sweet-juiced fruit."

Macfadyen's statement regarding the experience in Jamaica is, however, in opposition to Gallezio. Macfadyen says, "It is a well-established fact, familiar to everyone who has been any length of time in this island, that the seed of the sweet Orange very frequently grows up into a tree bearing the bitter fruit, numerous well-attested instances of which have come to my own knowledge. I am not aware, however, that the seed of the bitter Orange has ever grown up into the sweet-fruited variety." Duchassaing says that in Guadeloupe the sweet Oranges often yield bitter fruit, while according to Dr. Ernst, at Caracas they sometimes yield sour but not bitter fruit. Brandis, who is considered one of the highest authorities on this subject, relates that at Khasia, in India, so far as he can verify the fact, the extensive plantations of sweet Oranges are from the seed.

It is difficult to harmonise these conflicting statements. The very extensive experience of Orange growers in Florida, California, and Louisiana entirely corroborates Gallezio's statement. In Florida for many years the policy has been extensively followed of growing trees from seeds of sweet Oranges, and in all cases known to the writer, sweet Oranges, usually of a very fair quality, have been produced. Indeed, the fruit of the sweet seedling Orange trees in Florida is of superior quality to the fruit commonly imported into the United States, and is well known in the markets of New York, Philadelphia, &c. Probably one-fourth of the Florida Orange groves, which in the season of 1894-95 yielded over one billion Oranges, are sweet seedling trees. It is so thoroughly understood that seeds from sweet fruit produce sweet Oranges of a fair quality, that no grower has any hesitation to rear extensive groves from sweet seed trees. Since the severe freezes of the winter of 1894-95, which killed to the ground almost all of the trees in the State, many groves which were originally budded on sweet stock are being re-grown by allowing sprouts, which have been thrown up by the sweet seedling stock, to grow into trees without budding. This illustrates how well it is known by Florida growers that sweet seedling Orange trees produce good sweet fruit. In Louisiana and California sweet seedling trees have also been grown to considerable extent, and always, so far as I can learn, with the same results that from seeds of sweet Oranges sweet fruit is produced.

Mr. William Fawcett, director of the Jamaica public gardens, states that, "The evidence goes to show that Macfadyen's experience was exceptional in finding that the seeds of the sweet Orange sometimes produced trees with bitter fruit. . . . The danger in planting seedlings of the sweet Orange appears to be small."\* Mr. Syme also says,† "The popular opinion in Jamaica that the majority of the seeds of a sweet Orange will produce sour Orange plants is not quite well founded, though there need be little surprise felt if a goodly proportion of the trees are productive of sour fruits. It may be safely asserted that there are few good sweet Orange trees in this island (Jamaica) so isolated from inferior varieties, sour-fruited Shaddock, Grape-fruit, Citron, Lemon, or Lime trees as to be beyond the influence of the fecundating pollen of the latter. It is intentionally chiefly to this influence, rather than to an inherent tendency in the tissue, that many seedlings, raised from sweet Orange seed, exhibit what may be termed degenerate or unmarketable fruits."

In the Reports from the Consuls of the United States on fruit culture in their several districts, in answer to a circular from the Department of State, sweet Oranges are reported to be grown wholly or largely from seeds in the following places: Morocco, Guerrero (Mexico), Ecuador, Jamaica, Guadeloupe, Porto Rico, Syria, Sidon, Philippius Islands, Naples, Azores Islands, Spain, &c.‡

Far the greater portion of the evidence, it will be seen from the above discussion, supports the belief

that seeds from sweet Oranges commonly produce sweet fruits. When bitter or sour fruits result from planting sweet Orange seed, it is probable that other seeds have been accidentally mixed with them or that they are the results of accidental hybridisation. Sweet Oranges are almost invariably grown near sour Oranges, Lemons, Limes, Pomeles, &c., and it is not greatly to be wondered at that from seeds formed under such conditions a hybrid occasionally arises. Both Fawcett and Syme think this is what misled Macfadyen. Stubbs and Morgan\* also mention this as one of the main causes of the variation in the quantity of seedling Oranges. That perfectly fertile seeds may be obtained by hybridising the different species of *Citrus* I have incidentally proven in the course of pollination experiments which I have been conducting under the direction of the U.S. Department of Agriculture. The following instances may be cited:—

Parson Navel Orange (a local variety of the common sweet Orange, *Citrus aurantium*), which is commonly seedless, crossed with pollen from the acid Lime (*Citrus limetta*), produced three full seeds, which were planted, and gave four seedlings, two embryos of one seed developing.

St. Michael Blood Orange (*Citrus aurantium*), crossed with pollen of Grape-fruit or Pomele (*Citrus decumana*), formed fifteen well-developed seeds, which were planted, and gave twenty-two seedlings. If seeds thus artificially hybridised are fertile, there is no reason to doubt that seeds accidentally hybridised may be fertile.

In each of the above cases the number of seedlings resulting is in excess of the number of seeds planted. This introduces an interesting feature into experiments of this nature. It is a well-known fact that most species of citrus fruits produce several embryos, some seeds producing as many as twenty-five; only from one to three of these, however, commonly develop. Crüger, Schacht, Hofmeister, Strasburger, and others have carefully studied this interesting polyembryonic development; and it appears, so far as we yet know, that only one of the embryos in each seed is formed by the act of fecundation, the others being what are termed adventive embryos, developing from the side of the embryo sac. It is thus probable that only the sexually-developed embryo will be influenced by the hybridisation. As two to three embryos frequently develop from a seed, even in cases of hybridisation some of the seedlings, those from adventive embryos, will probably produce true to the parent bearing the fruit.

While seedlings of the sweet Orange produce sweet fruit similar to those produced by the parent, there is yet much variation in the fruit from such seedlings. Commonly it can hardly be distinguished from the parent, but many are of much inferior quality, and occasionally one producing fruit superior to that of the parent tree may be found. This uncertainty in the quality of the fruit is what renders budding or grafting desirable in this industry as in others. There is, however, by no means so great a difference between the fruit of the common seedling and that of the best budded varieties as occurs in certain other fruits, such as the Pear and Apple. If sweet seedlings are to be grown, the seeds should be taken from selected seedling trees, known to produce good fruit, which are isolated from trees of other varieties and species. By such selection one would avoid the probability of obtaining seeds affected by crossing or hybridising with other varieties, and may be quite sure that the trees from such seeds will produce good fruit.

The various improved varieties of the sweet Orange, such as the Hart's Late (Tardive), Jaffa, Majorca, Ruby, &c., cannot be depended upon to reproduce true through the seed. The policy of budding the trees to selected varieties cannot be too strongly recommended.

#### BITTER OR SOUR ORANGE (*CITRUS BIGARADIA*).

Whether the bitter or sour Orange be classed specifically with the sweet Orange, or is considered as a distinct species, the fact remains that the varieties in cultivation are totally distinct in foliage, fruit, and character of branching, from the sweet Orange, and that both are reproduced true through the seed. The seed of sour Oranges invariably produce sour fruit of the same general character. It is true the fruit of seedlings vary slightly in shape, size, taste, thickness of rind, &c., as in the case of sweet Oranges, but they are nevertheless distinctly sour Oranges. Gallezio

‡ Fruit Culture in Foreign Countries. Special Consular Reports, Washington, 1890.

\* Stubbs and Morgan, *The Orange and Other Citrus Fruits, from Seed to Market*. Special Bulletin, Louisiana State Experiment Station, 1883, p. 12.

says, "The sour Orange produces many seeds which always reproduce sour Oranges."

The sour Orange was introduced into Florida very early, probably by the Spanish, and escaping from cultivation, spread over the central and southern portions of the State. When comparatively recently—about 1870—interest was awakened here in the Orange industry, extensive wild sour Orange groves were found in many places. One of these, at Citra, Florida, contained some 500 acres. These wild groves

have mostly been cut off and budded, so that now but few of the original trees can be found. I have examined a number of these old original trees, and have always found them to produce comparatively the same fruit. The fruit from these old wild trees, furthermore, does not noticeably differ, so far as I have been able to determine, from the fruit of numerous cultivated sour Orange seedlings, one or two of which are found in almost every grove in the State. As these seedlings scattered through the

groves of the State are unquestionably descendants from seeds of the wild sour Oranges found here, the identity of the fruit is significant in this connection. I have made some enquiry of pioneer Orange growers who cut off and budded many of the wild sour Orange trees, and have been unable to learn of any marked difference having been observed in the character of the fruit on different wild trees. Orange growers here invariably feel sure of obtaining sour Oranges when sour Orange-seed is planted. *Herbert J. Webber, Special Agent, United States Department of Agriculture, Subtropical Laboratory, Eustis, Florida.*

(To be continued.)

A WAY OF SHOWING ORCHIDS.

In the delightful west country there are several places where the tree Ferns of the southern hemisphere may be seen growing out of doors in all their native magnificence, notably at Mr. A. P. Vivian's beautiful place on the Helford river in Cornwall, and also at the gardens of Tresco Abbey in Scilly, where the spring flowers are exported by the ton, and you may see the scarlet *Metrosideros* of the size of a good forest tree, and the rocks smothered with *Mesembryanthemums* and *Pelargoniums*.

A few years ago we put out about a dozen *Dicksonia antarctica* in an old Oak wood here, which is situated in a sheltered valley, and where I thought they might succeed, but the terrible winter of 1894 was too much for them, and in the spring of 1895 they were all dead. I thought the stems might be utilised in the hothouses for showing Orchids, Ferns, and stove plants; so last autumn we planted thirteen of them with Sander's new hybrid *Begonias*, different *Adiantums*, and stove creepers, and all the Orchids the gardener would let me have.

The result has quite come up to my anticipations, the Ferns and *Begonias* grow like weeds in the soft substance of the Tree Fern stems, which exactly suits their requirements; and as to the Orchids, they have done as well, if not better, than in the ordinary pots and pans and baskets. For instance, *Oncidium Lanceanum*, as Orchidists know, is not a very easy thing to do with—on the Fern-stems they are growing away and making leaves with the greatest vigour. But the chief advantage of this plan is that the things look exactly as if they were growing naturally—a great thing, I venture to think, with Orchids, and when these flower, the effect, with the rich background of *Begonia* leaves, out of which the Orchid flowers seem to spring, is exceedingly good.

To those Orchid growers whose space falls somewhat short of their wishes (rather a numerous body, I imagine), I venture to submit this idea as effecting a great saving of space. It is evident that if you can grow twenty or thirty plants on the space occupied by only one pot it is an advantage not to be despised by the owner of a small house. The Tree Fern stems are fitted tightly into pots as the easiest way to make them stand by themselves, or tied with one strand of strong copper wire at the top and the bottom of the iron pillars of the Orchid-house. It is much prettier to see these masses of foliage and bright flowers than the usual naked iron pillar.

The only cultural hint I have to offer is to water from the top with a rose; the water runs down the stem and reaches every root upon it without touching the leaves and flowers.

If any of your readers should think of trying this plan, I append a list of things I have found to do well on *Dicksonia* stems in the Cattleya-house here; but, of course, the idea is equally applicable to the cool Orchid-house or the conservatory. About 2 feet of the bottom of some of the *Dicksonia* stems is covered by a dense carpet of young Ferns, the result, I presume, of seed ripened by the Australian sun.

ORCHIDS.

*Cattleya citrina*, *C. marginata*, *C. Trianae*, *Cesogyne cristata*, *C. flaccida*, *C. ochracea*, *Dendrobium amonum*, *D. Farmeri*, *D. chrysotoxum*, *D. draconis*, *Laelia anceps*, *L. acuminata*, *L. autumnalis*, *L. Digbyana*, *Lycaste Skinneri*, *Maxillaria grandiflora*, *M. picta*, *Miltonia cuneata*, *M. spectabilis*, *Odontoglossum Cervantesii*, *O. citrosimum*, *O. maculatum*, *O. Rossi*

#### FERNS.

*Adiantum cuneatum*, *A. Legrandi*, *A. Lathomi*, *A. gracillimum*, *A. muudalum*, *Gymnogramma chrysophylla*, *G. Lancheanum*, *Pteris serrulata*, *P. cretica albo variegata*. The photograph shows a single stem, but for the pillars in the centre of the house it is a very good plan to put two stems of the *Dicksonia* back to back; when the plants upon them have grown, the iron pillar is quite covered. A.

## ORCHID NOTES AND GLEANINGS.

### ZYGOPETALUM WENDLANDI, &c.

This very distinct plant from Costa Rica, lately included under the now sunk genus of *Warszewiczella*, has a rich violet lip; and sepals, petals and column of dull white. The distichous leaves broaden towards the apex, and pseudo-bulbs are absent. A plant of this species is growing on a piece of teak in the gardens of the Royal Botanical Society, Edinburgh. Another species of *Zygopetalum* now in flower is *Z. Jorisanum*, a native of Venezuela, and introduced by M. Bungeoth. The pseudo-bulbs are about 3 inches in length, and bear two light green leaves. The inflorescence is erect, and the flower has a finely fringed lip of creamy-white running into yellow at the side-lobes, just under the crest, which is purple. *Waru* Cattleya-house treatment snits both of the *Zygopetalums*. *R. L. H.*

## COLONIAL NOTES.

### GRENADA BOTANIC GARDEN.

The annual report (for 1895) of the Botanic Garden, Grenada, has recently been published by Mr. W. E. Broadway, the Curator. In addition to the usual record of work done during the season, a protest is uttered against the rapidity with which Grenada is being denuded of its forest trees. It is hoped that, official and other influence being brought to bear upon the subject, conservancy measures may be made on a large and systematic scale, and that speedily.

## FLORISTS' FLOWERS.

### CARNATIONS AT GREAT BOOKHAM.

LOVERS of these beautiful flowers in the southern counties will find in a week or two a very fine and most interesting show of plants in large pots, and also planted out-of-doors, at Mr. J. Douglas's nursery, Edenwell, Bookham. The plants not only show bloom-buds in profusion, but they are very robust and clean. There is no evidence of either maggot or fungus at the present time, and probably there will be no trouble in that direction. Although interested with the sending out of Mr. Martin Smith's large-flowered varieties, which, by-the-by, everybody does not admire, it is noteworthy that Mr. Douglas has already secured some beautiful seedlings of the true Carnation type—notably a lovely rosy-carmine self, and a pleasing self of rich ruby colour. That there will be other fine things found in the large batch of seedlings presently, there can be no doubt. Some day, it is hoped, split podders will be absolutely condemned as unworthy of culture by Carnation florists. *A. D.*

**FLORENCE.**—An international horticultural exhibition will be held at Florence in May, 1897, under the auspices of the Royal Tuscan Horticultural Society.

## THE WEEK'S WORK.

### THE KITCHEN GARDEN.

By C. HERRIN, *Gardener, Drogheda, Maidenhead.*

**RUNNER-BEANS.**—The latest sowings of these Beans should now be made, and if a choice of position be possible, that which is the most sheltered by trees or buildings from the early morning sun, should be preferred, as affording some amount of protection from early frosts. If the present dry weather continues, it will be necessary to afford water to the drills before the seeds are sown, and the seeds may also be soaked in water for a few hours before they are sown, with a view of assisting their speedy germination. After the seeds are covered with earth, make it firm about the seeds by lightly treading it. Early sowings should now be staked, or as soon as the bine begins to "run," placing one strong stake to each Bean plant, making sure that it is strong enough to last the season and carry the weight of the tops. If some of the old stakes must be used, there should be a sufficient number of new ones mixed with them, to form a secure row, and in any case the stakes should be laced together with tarred string. A good mulch will be required by all runner Beans, and where they are cultivated on the pinching-back plan, and without support, the points should be nipped out of the stems when these are from 1 to 1½ foot in height. Unstaked Beans should be mulched between the rows with litter, so that the pods may not be splashed by rain.

**DWARF FRENCH BEANS.**—In many gardens a continuous supply of these Beans is required, and at this date another sowing will have to be made, the seed-drills and seeds being similarly treated to Scarlet Runner Beans. The variety *Ne Plus Ultra* is one of the best French Beans, being of a more desirable size than the larger Canadian Wonder. Afford a mulch to the earliest-sown Beans now coming into flower, and water the plants copiously if the dry weather should continue, otherwise the flowers will drop off without setting. French Beans growing in cold pits should now have the lights entirely removed. With us these plants are still podding freely, but they have required a large supply of water to keep them growing.

**PARSLEY.**—Much of last season's Parsley has run to flower, and unless it is required for seedling, the worst of the plants should be cleared off the land. Spring-sown Parsley has not done well generally, owing to the drought; but if the plants are crowded, thinning to about 4 to 6 inches from plant to plant should be attended to, the surplus seedlings being pricked out in small beds that can be covered in the winter with frames. The plants should be shaded from hot sun till they are established. If the drought continue, good Parsley will probably be rather scarce, and it will be prudent to afford water, and to mulch the plants with leaf-mould. Another sowing may now be made in well-moistened drills for late supply.

**ONIONS.**—The rain which fell for a few hours on the 10th inst. gave a great impetus to the growth of Onions, and the transplanted bulbs have taken a decided lead of those sown in the usual manner. If very large bulbs are desired, a mulch of finely broken-up rotten manure should be put on the beds, and the plants well supplied with water during dry weather, weak liquid-manure being afforded at intervals of a week or ten days, or a sprinkling of soot or nitrate of soda may be applied instead, washing them in with clear water.

**CELERY.**—By the time that these lines appear in print, the plants for the main-crop will be ready for transferring to the trenches from the beds in which they were pricked-out. It is a mistake to wait till the plants get crowded and compactly-rooted, as the check is much less, and less attention in watering and sprinkling to get them re-established is required. The bed a few hours before transplantation is commenced should, if dry, be well moistened; also the soil in the trenches if dry, should be watered the previous day, and made firm as soon as the surface is slightly dry. Let the plants be lifted with a ball or cube of roots and soil, remove small leaves or suckers from the base, and plant them with a trowel, doing this late in the afternoon if the weather be sunny, affording sufficient water at last to settle the soil. The tops should be sprinkled daily until it is seen that the plants have taken hold of the soil. Plants from the latest sowings should be pricked out a few inches apart, and shaded when necessary. They will produce small heads useful in the late spring.

**ASPARAGUS** sown early in April should now be thinned to about 4 inches apart. It may be transplanted next spring. The cutting of Asparagus should now cease, the beds be kept free from weeds, and if the soil is light, it should be slightly sprinkled with salt in showery weather.

**SEAKALE** should be looked over for the last time, and duplicate crowns removed. Keep the soil well stirred between this and other crops. Jerusalem Artichokes, although not requiring high moulding like Potatoes, are the better for having a little earth drawn up towards the stems. Any thinning of Carrots, Beetroot, &c., remaining to be done should now be finished off as soon as possible.

### PLANTS UNDER GLASS.

By Jno. McLEAVE, *Gardener, Woodslee, Darlington.*

**GARDENIA RADICANS, FLORIBUNDA, ETC.**—Cuttings struck in the spring, which have filled their pots with roots, stand in need of re-potting into 5 inch pots, in which, if well managed, they should make good plants, producing a good quantity of flowers of fair size next spring. In potting, two thirds loam of a rather strong nature should be employed, using with it plenty of the fibre, one-third part peat, and plenty of silver-sand and charcoal broken small. Place the plants in their growing quarters for the summer, and for this purpose pits or frames facing south are excellent both for growing and flowering Gardenias. Shade should be afforded the plants on sunny days till established, when no more shade will be required. As the pots fill with roots, water must be copiously afforded when needed, and the syringe used vigorously on hot days. Thrips and red-spider injure the plants if means are not taken to rid them of these pests, disfiguring the foliage, and affecting the flowering of the plants. The most efficient means of destruction is to dip the plants in strong soap-suds made with water, soft-soap, and flowers-of-sulphur, and having a warmth of 90°. If black-fly only be present on them, the sulphur need not be used. Dip for two or three nights in succession. Old plants which, having been pruned after flowering was past, have made considerable growth, may be shaken out of the soil and re-potted forthwith, reducing the balls so that they will go into a pot one size smaller than those they came out of, shifting when again established in the new soil. I do not keep my *Gardenia* plants longer than two years, the best results being obtained from young plants.

**POINSETTIAS.**—The entire stock of plants required having now been struck from cuttings, and well established in the cutting-pots, preparations should be made for separating and potting them, using as a soil loam of good quality three-quarters, dried cow-manure one-quarter, rubbed through a quarter-inch sieve, with a small quantity of sand. My usual method is to put the rooted cuttings into their flowering-pots, say, of 5 or 6 inches diameter, thoroughly clean, moderately crooked pots, with some finely-broken charcoal placed above the crocks, potting with a moderate degree of firmness. Much care is required in applying water to these newly-potted plants; and, in fact, little or no water will usually be found necessary before the roots have pushed into the soil. Afford them a humid atmosphere, and dew them overhead night and morning, which will be sufficient for some time after being given so large a shift. To grow them well, a low span-roofed structure is the best; and if ventilation can be afforded at the top, it is all that is required in hot weather, that is, if draughts of cold air be avoided. If a good many plants are grown, the tops of one-half as soon as they show bracts may be taken off and struck, to furnish dwarf stuff for house-furnishing during the winter.

### FRUITS UNDER GLASS.

By W. PORE, *Gardener, Highlere Castle, Newbury.*

**VINERIES.**—In vineries in which the Grapes are beginning to ripen, the floors, &c., should be damped down occasionally, but a close condition must be guarded against by applying a certain amount of artificial heat in dull weather, so as to ensure a circulation of air in the house. Varieties like *Chasselas Masqué*, *Madresfield Court*, *Golden Champion*, &c., which are tender-skinned, should be afforded a considerable quantity of ventilation if splitting of the berries be noticed. If splitting does not then cease, bore a hole with a small gimlet through the lateral just below the bunch, which will check the flow of sap to the berries; aided by free ventilation it is a sure preventative. Inside and outside borders should be examined, and if found to be getting dry a heavy application of diluted farmyard manure should follow,

mulching the border afterwards with dry short litter. As soon as the fruit begins to colour, admit more air, and continue the use of fire-heat. The night temperature should be 65° to 70°, and 80° to 85° by day. Muscat-vines should have a night temperature of 70° to 75°, with a corresponding increase in the day-time.

**GRAPES SWELLING.**—Where the berries have finished stoning, the Vines should have a genial warmth afforded them by artificial means when necessary, the paths and borders should be sprinkled morning and afternoon, and the mulchings on inside borders be renewed—or rather fresh, short stable-manure may be added to the old mulch. After afternoon damping, close theinery for an hour or longer, and then put on air at the top, and so leave it for the night. The ventilation should be increased in the morning when the warmth reaches 70°, keeping it at from 80° to 85° throughout the day. The laterals at this stage may be allowed to grow freely, but there should be no crowding, or the best leaves will be deprived of light and air.

**GRAPES STONING.**—During the period of stoning close attention should be given, so as to guard against the scalding of the berries; a rather higher night temperature should be allowed, and ventilation afforded early in the day, and more freely as sun-heat increases, and theinery closed late in the afternoon. In the case of very bright weather, a slight shade put over the roof for a week or two will be an advantage. Care must be taken in thinning Lady Downes and other late Grapes, to thin the bunches several times, having due regard to the size the berries of the varieties may be expected to attain at last.

**POT VINES.**—When the plants have completed their growth more air will be required in the house, less moisture should be afforded the soil, and syringing discontinued. Let the principal leaves be fully exposed to light. When properly matured and hardened, stand the Vines out-of-doors in a sunny situation.

### THE ORCHID HOUSES.

By W. H. WURR, *Orchid Grower, Burford, Dorking.*

**CECLOGYNE SANDERIANA.**—In the Cattleya-house the plants of this rare species are showing new breaks, and at such time water should be plentifully afforded at the roots. It should be stated that nothing now will induce the plant to flower unless it has been rested in a proper manner. The plant needs to be well exposed to the light, but shaded from direct sunshine; and re-potting should be performed as soon as the flowers fade. As regards any of the plants of this species which have not flowered, they should be supplied with fresh potting material as soon as the young roots make an appearance.

**PLEIONES** (the so-called Indian Crocuses) will now be in full growth, and if the plants are strong, and have much vigour, they should be abundantly watered at the root, and at alternate waterings have weak liquid-manure, made from cow-dung; and this kind of treatment should be followed till the foliage shows the colours of maturity, when the latter must be discontinued—and when the leaves begin to fall off, water should be gradually withheld.

**CATLEYA WALKERIANA.**—This plant will now be making roots freely from those rhizomes which have flowered, and, if re-potting is thought to be needed, this should be performed without delay. Like some other Cattleyas of dwarf growth, plenty of sunlight should be afforded it, and, for this reason, its cultivation in baskets or shallow pans hung up close to the roof is to be preferred to pot-culture. Even when in full growth the compost should not be kept in a moist state always, but it should receive thorough applications of water at rather long intervals of time.

**OTHER CATTLEYS.**—The following may be repotted, viz.: C. Mossiae, C. Mendeli, C. Schroderae, C. Skinneri, C. Warneri, C. amethystoglossa, C. intermedia, C. Harrisonae, C. Schofieldiana, Lelia tenebrosa, and L. Perrinii. These are plants which cannot endure to be disturbed for repotting purposes oftener than is absolutely necessary—that is to say, only those that require more space for the proper development of growth, or plants which may have become unhealthy. In such case the plants should be turned out of their pots, cleaned well in every part, and repotted in pots of as small a size as their roots will go into. As regards established plants which may need more space, the roots should never be disturbed unnecessarily, but those which are attached to the pot should be loosened with a thin-bladed knife, and the pot broken, commencing to do this

at the rim, and as much of it should be taken away as may be possible without disturbing the drainage; then pick out from among the roots every bit of decayed compost, place the plant in a clean pot of a size sufficient to afford space for two seasons' growth, keeping the rhizome of the plants a little above the rim of the pot. Now fill in around the roots with clean crocks, and afford a very thin layer of compost into which the plant may root, which should consist of equal proportions of fibrous peat and sphagnum-moss, amongst which crocks of good thickness should be freely used. The whole should be placed together with firmness, and some stakes should be inserted in it to hold the plants securely in their places. The disturbed plants should be stood in a shady part of the house, where the surroundings are fairly moist, and be afforded water sparingly till new roots push and growth becomes active, when more water may safely be applied. Woodlice do much mischief to the young roots and points of the roots of Cattleya plants, and means must constantly be taken to catch them. Lelia purpurata, L. grandis, Lelia-Cattleya eximia, L.-C. Arnoldiana, L.-C. Canhamiana, and others whose flowering has recently finished, should be placed in a cool, airy part of the house, to remain there till growth begins anew, affording a very small quantity of moisture at the root, in fact only just sufficient to keep the latter alive and the pseudo-bulbs from shrivelling.

### THE FLOWER GARDEN.

By HEDLEY WARREN, *Gardener, Aston Clinton, Tring.*

**OPERATIONS IN GENERAL.**—By this date bedding-out of all kinds should be brought to a close, and in case sufficient rain does not fall to moisten the soil to the depth of a foot, artificial watering must be resorted to. Where the plants in the beds are beginning to make growth, the surface of the soil should be stirred with a small draw-hoe or a three-tined short-handled fork, or if the plants are very close together, a short sharp-pointed stick may be used instead. If the land is of a light kind, the beds may be mulched with cocoa-nut fibre. Make good all blanks in the earlier-planted beds, and remove decaying leaves and flower-stems. Such plants as Pansies, Violas, and Calceolarias soon cease to flower if seed be allowed to form; the decaying flowers should therefore be removed. The shoots of plants used for the groundwork of beds should be pegged down pretty closely, but not so much as to give a formal appearance to them. Box edgings may still be clipped, and branches of flowering shrubs or evergreens that are encroaching on the walks removed, as there is still time for new growth to hide the mutilated parts. Mowing and weeding will now occupy much labour, but they are very necessary jobs if the lawn, walks, and borders are to present a good appearance. Sowings may yet be made of seeds of Wallflower, Brompton Stocks, Sweet Williams, Aquilegias, Delphiniums, &c. If the sowings are made on a border, first afford the ground a dressing of soot, so as to deter slugs from molesting the seedlings.

**DAHLIAS** soon make rapid growth when planted out, but if little or no rain has fallen they will soon suffer from lack of moisture in dry soil, in a season like the present, and should be heavily watered. Place flower-pots containing a little dry moss or hay, on the top of the stakes, and lengths of Bean-stalks about the plants as traps for earwigs; and it is well to do this early in the season, as the insects may then be destroyed before much damage is done.

**ROSES.**—As yet the blooms are not up to average quality, although it is somewhat early to form any decided opinion as to the prospects of the season. Newly-planted Roses should not lack moisture at the roots, nor a mulching of the roots. The diluted drainings from the stables and cowsheds may be afforded established plants, but for the present plain water will be the best for newly-planted specimens. Use the proper means to kill aphids and prevent the growth of mildew on Roses, and look out for the Rose-beetle and leaf-roller, both of which do much harm when unmolested. Tea varieties seem to be the more thriving Roses.

**HERBACEOUS BORDERS.**—Old borders will be fast getting into a crowded state, and frequent attention will be necessary in the matter of tying-up stems and removing here and there those that are encroaching upon their weak neighbours, neglect to do this often resulting in the death of the latter. Perennial Gaillardias are among the most valuable of hardy plants for affording flowers for cutting, and they are easily raised. Seedlings do better as a rule than cutting-raised plants, and produce larger flowers.

Plants raised from seed sown in March or April which have been grown in pots are ready for being planted-out. They should not stand in the beds closer together than 1½ foot each, otherwise the stems become drawn, and the blooms small.

**EARLY-FLOWERING CHRYSANTHEMUMS.**—The varieties Madame Desgranges, Strathmeeth, Précocité, and some others present prominent flower-buds, especially those growing in flower-pots. These buds, if allowed to develop, will produce an early supply of bloom; but if this is undesirable, take out the points of each growth, and give a good watering with a stimulant.

### THE HARDY FRUIT GARDEN.

By G. WOODGATE, *Gardener, Rolleston Hall, Barton-on-Trent.*

**APRICOT, PEACH, AND NECTARINE** trees should be given frequent attention in the matter of training and nailing-in the shoots left for the extension of the tree. Young wood in the body of the trees may be secured by twigs cut from the suckers of Syringa or Privet. This is a better practice than nailing them in, and is more quickly done. The foliage having now become more fully developed, it will be easier determined how many young growths it is necessary to leave. It must be borne in mind that only by allowing every leaf sufficient space for development can we hope for perfectly-ripened wood on open walls, even in the best of seasons.

**PEARS, APPLES, AND PLUMS** grown as pyramid or bush trees, require to have all the side-growths pruned back to five or six leaves, unless any shoots are necessary for forming new branches; in which case the shoots should be treated as leading growths, and stopped when about 12 inches long. Study to keep the centre of the trees sufficiently open to allow of the free access of light and air. Espaliers and cordons may be treated similarly, except that the leading shoots must not be shortened until the trees have filled the required space, they may then be treated like side-growths. Older trees are prone to produce numerous young growths from the old spurs, and where this is the case, many of them should be removed entirely, saving only sufficient for forming fresh spurs. Any of the old spurs which are not fruiting, and which may have become unsightly, should be cut back in order to give the young growths at the base the exposure required for their development into fruiting spurs. Thin out the fruits, if necessary, by removing the smallest and any that have been attacked by caterpillars, taking away at the same time any dead petals that may have remained among the fruits.

**MISCELLANEOUS WORK.**—Employ all means possible for the destruction of insect-pests. Forceful syringings with the hose-pipe or garden-engine will tend to keep the trees clean, but an insecticide may be required occasionally, and it should be used betimes to prevent aphids and other pests from becoming established on the shoots. Continue the protection of Cherries and Strawberries from birds. In the case of Cherries on walls, the nets must be kept away from the fruit by laths placed against the top of the wall, and standing 2 or 3 feet out at the base. Wood or iron borders of sufficient length to span three or four rows of plants are most convenient for supporting the nets required for the Strawberry-beds.

**WHENCE CAME THE CULTIVATED STRAWBERRY?**—Prof. BAILEY, in the *American Naturalist*, 1894, answers this question in the following terms: Garden Strawberries are a direct modification of the Chile Strawberry. The initial variation occurred when species were thought to be more or less immutable, and lacking exact historical evidence of introduction from a foreign country; hybridisation was the most natural explanation of the appearance of the strange type. This modified type has driven from cultivation the Virginian berries which were earlier introduced into gardens, and the original type of the Chilean Strawberry is little known, as it tends to quickly disappear through variation when impressed into cultivation. The Strawberry is an instance of the evolution of a type of plant in less than fifty years, which is so distinct from all others, that three species have been erected upon it, which was uniformly kept distinct from other species by the botanists who had occasion to know it best, and which appears to have been rarely specifically associated with the species from which it sprung.

## EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

## APPOINTMENTS FOR JULY.

TUESDAY,	JUNE 30.	Maidstone Rose and Horticultural Show. Sutton Rose and Horticultural Show.
WEDNESDAY,	JULY 1.	Ancient Society of York Florists' Show. Croydon Rose and Horticultural Show. Farningham Rose and Horticultural Show. Ealing Horticultural Show. Ipswich Horticultural. Royal Botanic Society (Evening Fête).
THURSDAY,	JULY 2.	Bath Rose and Begonia Show. Rose and Horticultural Shows at Gloucester, Norwich, Eltham, and Dublin.
SATURDAY,	JULY 4.	National Society's Rose Show, at Crystal Palace. Isle of Wight Horticultural Assoc. Meeting. Société Franc d'Hort Meet.
SUNDAY,	JULY 5.	Royal Horticultural and Agricultural of Ghent.
TUESDAY,	JULY 7.	Wolverhampton Floral Fête (three days)
WEDNESDAY,	JULY 8.	Newcastle-on-Tyne Summer Show (three days). Rose and Horticultural Shows at Hitchin, Lee, Redhill, Canterbury, and Tunbridge Wells. Royal Botanic Society Promenade.
THURSDAY,	JULY 9.	Workshop Rose and Horticultural. Helensburgh Rose and Canterbury Hospital Fête and Flower Show. Rose Shows at Woodbridge and Aylesbury.
SATURDAY,	JULY 11.	Royal Botanic Society Meeting.
TUESDAY,	JULY 14.	Royal Horticultural Society Committees (Roses).
WEDNESDAY,	JULY 15.	National Rose Exhibition at Ulverston. Geneva Exhibition (temporary show six days). Royal Botanic Society Promenade.
THURSDAY,	JULY 16.	Rose and Horticultural Shows, at Halifax, Selby, and Finchley. Jersey Summer Show.
SATURDAY,	JULY 18.	New Brighton Rose Show.
TUESDAY,	JULY 21.	Tilshelf Rose and Horticultural.
WEDNESDAY,	JULY 22.	Royal Botanic Society Promenade. Beckenham Horticultural Show.
SATURDAY,	JULY 25.	Royal Botanic Society Meeting. Rose Show at the Botanical Gardens, Manchester.
TUESDAY,	JULY 28.	Royal Horticultural Society Committees.
WEDNESDAY,	JULY 29.	Birmingham Horticultural and Rose (two days). Royal Botanic Society Promenade.
THURSDAY,	JULY 30.	Trentham and Hanford Horticultural and Rose Shows, Bishops-coteigton and District Horticultural Show.

## SALE FOR THE ENSUING WEEK.

FRIDAY, JULY 3. Imported and Established Orchids, at Frotheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK—62.7.

The Royal Gardeners' Orphan Fund  
As we went to press last week the dinner of this excellent society was held at the Métropole, under the chairmanship of His Grace the Duke of BEDFORD. The Duke is known to follow the traditions of his liking for horticulture and agriculture in the interest

he takes in allotments and in technical education. This is shown by the two experimental stations he has founded, one for agricultural purposes, the other for fruit culture. Moreover, his connection with Covent Garden rendered him a specially fitting President. It is no wonder, then, that his Grace received a warm welcome from his tenants who assembled to do him honour, and from the large body of horticulturists present. The claims of the fund are so generally recognised, and its usefulness so well appreciated, that no long speeches were necessary to enforce them. His Grace was brief and to the point; other speakers included Mr. MARSHALL, the zealous chairman of the committee, always ready to do a good turn where it is required; Mr. POUPART, who spoke as the exponent of the market growers and of the Covent Garden interest. Mr. SKEWES COX, M.P., made a humorous speech *à propos* of gardening and gardeners; and Dr. MASTERS, in proposing a cordial vote of thanks to the President for his presence that evening, spoke of the many services rendered to Horticulture alike by former Dukes, and by the present representative of that noble house—services, the general nature of which was referred to in our columns last week. Sir EDWARD MALET, lately British Ambassador at Berlin, responded for the visitors. The tables were profusely and elegantly decorated with flowers sent by eminent horticulturists, and arranged by Miss HUDSON, and after the dinner they were sent to the Children's Hospital in Great Ormond Street. In spite of the absence at York of several prominent members of the Society, the meeting passed off very successfully, and reflected credit on the committee and Secretary. The amount collected was over £865.

THE ROYAL HORTICULTURAL SOCIETY AND THE PROVINCIAL SOCIETIES.—The York Gala last week was the occasion of an interesting experiment, the results of which we shall watch with great interest. We have always strenuously advocated the closer union and conjoint action of the metropolitan and the provincial societies, feeling assured that such co-operation would be for the benefit of horticulture in general, and for the mutual advantage of the societies. The provincial shows which were held in past years by the Royal Horticultural Society were not financially so successful as to justify the Society in renewing them in spite of their great success from a horticultural point of view. The present experiment was of a more modest character. The Society was invited by the York authorities to send down a deputation, and in response an influential number of representatives of the Council and the various committees accepted the invitation, and were hospitably entertained by the LORD MAYOR OF YORK, and the committee. The deputation, as we mentioned last week, comprised Sir TREVOR LAWRENCE, the President of the Society; Mr. THISELTON-DYER, C.M.G., the Director of the Royal Gardens, Kew; Rev. Mr. WILKS, Secretary, and several members of the Council, to whom must be tendered the hearty thanks of the Fellows of the Society. The details of the show were recorded in our last issue. The deputation, we learn, was greatly pleased at the cordial reception they met with, and were struck with the fine specimen plants (now rare in London exhibitions), with the Pelargoniums, and other exhibits. Independently of the judges who made their awards in the competition classes in the usual way, the

deputation selected for special honour such exhibits and groups, competitive or otherwise, which they deemed worthy of recognition. Flower shows are very tangible things, but we doubt not, if this experiment succeeds, the influence of the Society in promoting horticulture in other not less important ways will make itself felt.

BRUCE FINDLAY.—It is with sincere regret that we announce the death of Mr. BRUCE FINDLAY, Curator of the Manchester Royal Botanical Gardens, which took place at his residence in the gardens at Old Trafford on Tuesday, June 16, at the age of sixty-one years. The sad event was not unexpected, for Mr. FINDLAY has had but indifferent health for some time past, and since the death of his wife in 1895 he seems to have gradually broken down; the change in his health, which was not very marked at first, having been so rapid of late, that those of his intimate friends who caught a glimpse of him at the last great Whit-week show at Manchester could see but too plainly that the end was at hand.

Of BRUCE FINDLAY it may be said that he was one of the cleverest and most persevering men connected with horticulture in our times—clear-headed and irrepresible in matters which he wished to push forward, and certain to gain the confidence and support of those whom he wished to aid him, by reason of the earnest, yet quiet, manner he had of putting the matter he had in hand before them. Few men connected with gardening had a wider circle of friends than he, as he had the respect of all, both rich and poor alike.

His death has brought many letters touching on his good qualities, one of which, from JOSEPH BROOME, Esq., of Llandudno, one of Manchester's oldest and best gardeners, so well sets forth the general feeling towards the late BRUCE FINDLAY that we are glad to give an extract. Mr. BROOME says, "Our dear friend, BRUCE FINDLAY, is gone at last. He was interred at the Stretford Cemetery on Friday, a large concourse attending the funeral, including many gardeners and those interested in and connected with horticulture, both private and professional. I saw him for the last time on Wednesday week, and had an interview with the doctor previously, who explained to me that he could not live long, there being some internal trouble which was irremediable. This shocked me greatly and made me sad indeed. We had worked together with harmony and happily for many years for the good of our society, he as curator and secretary, and I as treasurer and chairman of the Council. During all this time I had opportunities of estimating the true worth of our dear friend. I had a sincere regard for him, and had the pleasure of being instrumental in a great degree in getting the greater part of the £1000 testimonial and the other presents to himself and his wife subscribed."

None had a better opportunity of knowing his good qualities than Mr. BROOME, and though many speak of him in the same strain, none so forcibly suggests the good feeling which existed between the late BRUCE FINDLAY and those with whom he worked, than he in his simple and sympathetic words.

BRUCE FINDLAY was of Scotch extraction, was born at Streatham in Surrey in 1835, and after his school-days were over entered the nurseries of Messrs. ROLLISSON. Leaving there, he passed some time at the Royal Gar-

SNOWDROPS UNDER LIME TREES, AT STRAFFAN HOUSE, CO. KILDARE, IRELAND.

dens, Kew, and afterwards went as foreman at the Botanic Gardens, Hull, where he stayed about two years, when he left to take a similar appointment at the Sheffield Botanic Gardens.

In 1858 he was chosen curator of the Manchester Botanical Gardens, and here he found ample scope for his energies and resources, and soon gained the confidence of the leaders in gardening, which was then commencing to be prosecuted in earnest in Manchester, and which has since developed in such a remarkable manner.

In 1867, at Mr. FINDLAY's suggestion, the annual spring show was changed to Whitsuntide—the great Lancashire holiday, and the prize money was increased from £200 to £1000. This resulted in the transformation of a local show into a national exhibition on a very large scale, and with satisfaction both to the exhibitors and the Society. Then came the great International Exhibition of 1873, which was a fine show in itself, and did much to spread the love of gardening, a consideration which was ever uppermost in the mind of the Curator, and which he had still further opportunities of emphasising when he became Secretary to the Society in 1875. The great Whit-week shows at Manchester were looked forward to by a large number of persons interested in horticulture, and the Curator and Secretary worked hard to keep them up to what he considered the proper standard, and always with success, although the amount of work was occasionally very great, and must have been a great strain. In recognition of his services, a Testimonial Committee was formed, and at the Manchester Town Hall on November 24, 1881, under the presidency of the Mayor, the presentation consisting of an address, a cheque for £1000, and a gold watch and chain, was made, the Mayor extolling the good qualities of the Curator, whose wife was also presented with a gold watch and chain at the same time.

In 1890 he received the Veitch Memorial Medal for distinguished services to horticulture, and in making the presentation, Sir TREVOR LAWRENCE, Bart., said that it would be impossible to hand the Veitch Memorial Medal to a worthier recipient. One thing troubled Mr. FINDLAY very much, and that was that he considered foot-ball and kindred sports with which he had necessarily something to do at Old Trafford were undermining the gentler art of gardening; at all events, he said, the interests of sports and of gardening were, he considered, conflicting.

In BRUCE FINDLAY, Manchester, and horticulture generally, has had a good and pleasant servant, who will not easily be replaced, and his departure from among us we sincerely deplore—a sentiment which will be endorsed by thousands of gardeners and garden-lovers throughout the length and breadth of the land.

FROM Sydney we learn of the retirement from the directorship of the Sydney Botanic Garden of our old correspondent, Mr. CHARLES MOORE. He was the brother of Dr. DAVID MOORE, formerly of Glasnevin, and uncle to the present director of that garden. Mr. CHARLES MOORE is a native of Dundee, Scotland, and was born in 1820. After his education, which was commenced in Dundee and completed in Dublin, he was appointed assistant to his brother, Dr. MOORE, then botanist to the Ordnance Geological Survey of Ireland. He afterwards held positions in the Royal Gardens at Kew, and the Regent's Park Gardens. Prior to his appointment as Director of the Sydney

Botanic Gardens—which was made in 1847 by Earl GREY, then Secretary for the Colonies—he was subjected to an examination in botany by Professor HENSLOW, of Cambridge University, whose flattering credentials on Mr. MOORE's attainments gained him the Sydney appointment. Mr. MOORE was thus the last of the officials who were appointed by the Home Government before the colony became self-governing. When Mr. MOORE came to Sydney, the Gardens were controlled by the Museum authorities. The grounds were in what present-day people would call a very rude state, but Mr. MOORE set to work with a will, and gradually brought them to their present beautiful condition. He reclaimed nearly all of the land that constitutes the lower portion of the Gardens, and laid it out in such an artistic manner as to make it, perhaps, not the least attractive portion of the grounds. He was the means of erecting a lecture-hall on the top part of the grounds, and instituted a series of lectures on botany, which he delivered from time to time, and which were largely attended. He instituted the popular as well as the scientific naming of the plants, tree-growths, and flora, for the benefit of the public, and made the gardens a place of pleasurable and scientific resort second to none. Mr. MOORE is a member of the Linnean Society, a Fellow of the Royal Horticultural Society of London, an Associate of the Royal Botanical Society, London, a Veitch Medallist, and a member of various foreign scientific societies. In 1867 Mr. MOORE went as N.S.W. Commissioner to the Paris Exhibition, and whilst on the Continent he made vigilant inquiries into the disease that was ravaging the Oranges of this colony, as well as those of Portugal and Spain. He afterwards published a valuable and comprehensive report on this subject. In 1874 he attended the Universal Botanical Conference in Florence, and had the honour of being received as the N.S.W. delegate by his Majesty King VICTOR EMANUEL. In 1850 he made a trip of research to the New Hebrides, Queen Charlotte Group, Solomon Islands, and nearly the full circuit of the coast of New Caledonia, bringing back with him a large and varied assortment of plants, most of which were new to culture, and many entirely new to science. He has published a pamphlet on the *Woods of New South Wales*, and a work dealing with the *Census of the Plants of New South Wales*, also subsequently a complete *Flora*, recently noticed in our columns.

**STRAFFAN HOUSE, KILDARE.**—In the issue of the *Gardeners' Chronicle* for May 30, 1896, we had occasion to figure a view of the gardens, and now supplement it with a view showing the manner in which Snowdrops are planted in the grass. Apart from the spreading masses of common single and double kinds, there are in pet nooks and corners the rarer kinds, such as *Galanthus Ikarie*, *G. Elwesii* in variety, *G. Scharlokii*, *G. Cassalia*, *G. Aidin*, and last, but best of all, the great Tchernaya Valley Snowdrop, introduced by a kinsman of the family in 1856 after the Russian war. This is the Straffan Snowdrop (*G. nivalis grandis*) from the battle-field of Tchernaya, where the allied troops were victorious on August 16, about the end of the Russian campaign in the Crimea. The great flowers remind one of those of *G. Imperati* from Naples, but it is far more robust in growth and more free in its blossoming, spreading about like the ordinary Snowdrop, and growing fully 15 inches in height. The great fault of all the new kinds of Snowdrops is their slowness of increase, especially if planted on the grass, whereas the main charm of the ordinary

single and double kinds is their luxuriance and free-spreading character. The point seems to be that the Northern Snowdrops are the ones really best suited to our gardens, those of the south and east being a little too delicate and tender for our rough and cold climate.

**FRUIT CIRCULAR.**—We propose to issue our annual report on the condition of the fruit crops in our number for August 1. Circulars will be sent in the ordinary course. The publisher desires us to request fruit salesmen and others who desire extra copies, to be kind enough to communicate with him at an early date, in order that a sufficient number of copies may be printed. Frequently a demand occurs after publication, when we can no longer comply with the requisitions.

**SPECIAL PRIZES FOR DESSERT APPLES AND PEARS.**—With a view to the formation of a definite list of the best-flavoured varieties of British-grown Apples and Pears for dessert at all seasons, Messrs. JAMES VEITCH & Sons of Chelsea have kindly placed a sum of £30 at the disposal of the Council of the Royal Horticultural Society, who, in conjunction with the donors, have drawn up and sanctioned the following scheme, commencing with the Society's meeting on July 14, 1896, and continuing till the last meeting in June, 1897, the Temple Show meeting only being excepted:—The four following prizes are offered at every Fruit and Floral Meeting of the Society (Temple only excepted) on and after July 14, 1896, until and including the last meeting in June, 1897, for amateurs and gentlemen's gardeners only, subject to the undermentioned rules and conditions.

Class AA. For the best flavoured	1st Prize.	2nd Prize
Apple	10s.	5s.
Class BB. For the best flavoured		
Pear	10s.	5s.

*Rules and Conditions.*

1. Entry for either of these classes must be made at the Fruit and Vegetable Committee Table before 11 A.M. on the morning of the meeting. For the meeting at the Crystal Palace, see special schedule.
2. No exhibitor may enter more than three distinct varieties in each or either class at each meeting.
3. Six fruits (neither more nor fewer) of each variety must be shown, the judges being at liberty to cut any three of them they please.
4. Every exhibitor must guarantee that the fruit he exhibits in these classes has been grown *entirely* out of doors. He should also state on the name-card "wall-tree," "bush," or "standard," together with the aspect—north, east, south or west—the nature of the soil; the county; and, when known certainly, the stock on which the tree is grafted.
5. The judges are requested to allot twelve points to a perfect dish of fruit—perfect in flavour, in quality, in appearance, and in size—distributing the points in the following proportions:—

For flavour	6 points
For quality	3 "
For appearance	2 "
For size	1 "

By "quality" is intended the meltingness and smoothness (absence of grittiness) of the flesh, or (as, for example, in the case of early Apples) its crispness and juiciness.

By "appearance" is intended colour and beauty of outline and shape.

By "size" is intended such as invests the fruit "with the greatest value for table use." "Enormous specimens should not be preferred, as, beyond a certain point, size becomes a defect in dessert fruits. *File* R.H.S. Rules for Judging, &c., 1896 Code.

6. When several exhibits of the same variety are shown by several exhibitors, and the flavour and quality of two or more of them are found to be equal, the judges are directed in such case to award the prizes according to the demands of "appearance" and suitable "size."

7. The 1st and 2nd prizes are not to be awarded to the same variety at the same meeting.

8. An exhibitor having won the 1st prize, may not compete again during the year with the same variety, but the same variety exhibited by different exhibitors may take the 1st prize at any or all the meetings, and similarly with the 2nd prize; nor may an exhibitor who has won a 2nd prize take another 2nd prize with the same variety; but an exhibitor having taken a 2nd prize, may take a 1st prize with the same variety at any subsequent meeting.

9. The prizes will be withheld if the fruits shown are considered wanting in sufficient flavour for dessert, or not fair specimens fit for table.

10. In all other respects the Royal Horticultural Society's General Rules (p. 44 Schedule of Arrangements, 1896), will apply.

**THE CHRYSANTHEMUM.**—We have recently received a copy of the first number of a new French

magazine, to be published every two months, entitled *Revue Générale Internationale; Scientifique, Littéraire et Artistique*. The publisher is PAUL OLLENDORFF, 28 bis, Rue de Richelieu, Paris. The number before us is got up in excellent style, both as regards printing and illustrations, and amongst other articles it contains one on the Chrysanthemum, by M. HENRY L. DE VILMORIN, the well-known French horticulturist. M. DE VILMORIN'S contribution is one of the best magazine articles on the popular flower that has come under our notice, and occupies twenty-eight pages. He deals in an interesting and exhaustive manner with the history, physiology, and cultivation of the flower, and his remarks are illustrated with about a dozen figures of various types of the Chrysanthemum in black and white, the most striking of which are, perhaps, full-paged delineations of Lilian B. Bird, Yellow Dragon, Willm. Falconer, Etoile de Lyon, Boule d'Or, Souvenir de Haarlem, Gloire Rayonnante, &c. While rendering a tribute to the growers of his own country in their efforts to ameliorate the flower in every way, M. DE VILMORIN does ample justice to the claims of the American, Guernsey, and English cultivators. Several illustrations are also given of curious forms of the flower as grown in Japan. These we think are from sketches by the famous popular Japanese artist, HOKUSAI.

**SYDNEY BOTANIC GARDEN.**—Mr. J. H. MAIDEN informs us that he has been appointed Government Botanist to New South Wales, and Director of the Botanic Garden. Mr. MAIDEN is well known for his researches in economic botany, and in the botany of Australia. We may congratulate both him and the Government on this appointment.

**IRIS XIPHIODES (ENGLISH IRIS).**—A box of new varieties of this showy and easily-grown, hardy flower, sent by Messrs. E. H. KRELAKE & SON of Haarlem, Holland, represents it in quite a new light, the excellence of the flowers being beyond that of the old kinds. Indeed so large are they, and so rich in colour are the darker ones with their spreading oval falls, that they forcibly remind us of the beautiful *Iris levigata* (Kämpferi), and seem to suggest a way out of the difficulty which some experience in growing that handsome species, viz., to abandon it and take to these new forms of *I. xiphiodes*, which require little attention and never fail, provided they get a good supply of water until their flowers are over. Some twenty distinct kinds represent all the shades known in the species, and all are good. A selection of the best is Léon Tolstoi, a noble dark Tyrian purple, with yellow feather on the falls; Argentea, with pure white falls, bearing a few purple spots and rose-feathered standards; Tricolor, two shades of blue, with yellow ring on the falls; Mont Blanc, pure white; Almano, white tinged with lilac; Miss Wild, true blue; and Volunteer, rosy-lilac.

**CHESHUNT, WORMLEY AND DISTRICT HORTICULTURAL SOCIETY.**—The usual fortnightly meeting was held in the Coffee Room, Turnford, on Thursday, the 18th inst., Mr. W. HARRISON presiding, and there were fifty members present. Mr. F. S. HUTCHASON gave a paper on "The Life History and Metamorphoses of a Root-gall Nematode." *Tylenchus devastatrix*, or stem eel-worm, was first referred to, and its action in causing Tulip-root and Clover-stem sickness. The life-history of the *Heterodera radicola* was then thoroughly dealt with, the subject being illustrated by a series of drawings made from Mr. HUTCHASON'S own observations. Two of the Gourd-shaped female cysts were mounted under the microscopes, and were closely examined by the members. A discussion, in which Messrs. W. HARRISON, J. GUY, W. DYKE, &c., took part, followed, and the meeting closed with votes of thanks to Mr. HUTCHASON for his paper, and Mr. HARRISON for presiding. Two new members were elected.

**FIRST-CLASS BULBS.**—The Dutch Bulb Society has lately held a *plébiscite* to determine the best Hyacinths, Tulips, &c. Drawings will be made of them for publication. The following are the results of the voting:—

*Six White Hyacinths (single and double).*—La Grandesse, Graadleur à Merveille, Mont Blanc, L'Innocence, Madame van der Hoop, and Baron van Tuyl.

*Six Blue Hyacinths (single and double).*—Graad Maître, King of the Blues, Charles Dickens, Queen of the Blues, Czar Peter, and Regulus.

*Six Rose-coloured Hyacinths (single and double).*—Gigantea, Moreno, Noble par Mérite, Roi des Belges, Lord Macaulay, and Gertrude.

*Three Hyacinths, yellow and orange (single and double).*—Ida, King of the Yellows, and Sonora

*Three Purple Hyacinths (single and double).*—Haydn, Sir Wm. Mansfield, and Adelina Patti.

*Twenty-four Tulips (early single).*—Pottbakker (464 votes), La Précieuse, Keizerskroon, Vermilion Brilliant, Proserpine, Joost van Vondel, Rose Griselin, La Reine, Rosa Mundi, Chrysolera, Yellow Prince, Duchesse de Parma, Thomas Moore, Kanaïenvogel, Wouverman, L'Immaculée, Duc van Thol (scarlet), Ophir d'Or, Zilveren Standaard, Nelly, Rose Luisante, Rembrandt, and Gouden Standaard, with 189 votes.

*Twelve Tulips (double).*—Murillo, Tournesol, Imperator rubrorum, La Candeur, Salvator Rosa, Tournesol (yellow), Rose Blanche (see coloured plate *Revue de l'Horticulture Belge* of June 1), Rex rubrorum, Vurbaak, Mariage de ma fille, Alba maxima, and Raphael. The first with 461, the latter with 198 votes.

**DIOSPYROS VIRGINIANA.**—Some of our correspondents take us to task for stating that this North American species of Persimmon is not hardy in this country, which is certainly true, except in well-drained warm soils and favoured localities; but it rarely ripens its fruit with us. In countries with colder winters and warmer summers than ours, the wood gets well matured every year, enabling it to withstand more cold than is experienced in these islands, and produce fruit abundantly and ripen it. The summers of the last few years will have tended to make the trees in our gardens more fruitful than had been the case for many years previously. D. lotus and D. Kaki, the Date Plum, are species of Persimmon with finer fruit, but they are decidedly tender with us.

## HOME CORRESPONDENCE.

### BRODIAEA CALIFORNICA SYN. AUSTINÆ?—

Towards the end of last year five bulbs were sent to me from two importers of Californian bulbs under the above name, probably both of them having received them from the same collector. They purported to be a new species of *Brodiaea* found by Mrs. Austin, to which her name had been accordingly given. Only one of my five bulbs bloomed, though all of them grew vigorously and well in a pot in a cold house. The bulb which flowered (as if to make up for the remissness of its fellows), produced two flower-stems, the larger of which bore nine flowers in a bunch on its top, the smaller four. The former of these has been drawn, and will shortly appear in the *Botanical Magazine*, with description by Mr. Baker. When first I applied to this learned authority on all bulbous plants, he could give me no information whatever about it, nor even tell me what were its affinities. He has since, however, discovered that the plant is not a new species, as was at first supposed, but that it is identical with *B. californica*, introduced by Mr. Douglas in 1848, and figured in woodcut by the late Dr. Lindley in the fourth volume of the *Proceedings of the Royal Horticultural Society*, p. 84. The specific name of *Austiniæ* must therefore be dropped, except as a synonym. The flower resembles most that of *B. grandiflora*, but is much paler and less beautiful in colour, and of much taller and more robust growth, the flower-stem reaching to 2 feet 4 inches in height, the leaves considerably taller. W. E. Gumbleton.

**ABIES NOBILIS, PINUS MACROCARPA.**—I have in my pleasure-grounds a *Picea nobilis*, about 30 feet high, making vigorous growth. For some few years it has had a few (say half-a-dozen) cones on it each year. This year it had upwards of 100, all on the upper half of the tree, some boughs not more than 3 or 4 feet long having clusters of a dozen or more. Can you tell me in your notices to correspondents,

whether I ought to have them thinned before they get heavy, and weigh down the tree, and perhaps also weaken its constitution; and if so, how many I had better remove, and at what season it should be done? I notice the stem of a good *Pinus macrocarpa*, twenty-five years old, and about a foot in diameter, exhibiting exactly the same appearance as Larch canker, resin exuding plentifully from the defective place, though the tree grows luxuriantly; and in the same wood, a *Picea pinsapo* of the same age (twenty-five years) has a curious bunch of young shoots on one of its boughs, looking just like a bunch of Bananas. E. C. L. [The production of cones at an early age is generally a sign of failing health, but good results follow if a dressing of loam and leaf-mould be worked into the soil over the area occupied by the roots having previously thoroughly soaked the soil with water, and all, or nearly all, the cones be removed, and none is allowed to arrive at maturity for years to come. Ed.]

**DIOSPYROS VIRGINIANA.**—In the "Answers to Correspondents," p. 770, it is said that *Diospyros virginiana* is "too tender a plant for cultivation out of doors in this country." I grew it here for many years, and gave it up as not worth growing; but in a garden near Yatton, Somerset, I have seen it laden with fruit. But, surely, the Derby winner was not named from this plant, but from the very superior Japanese Persimmon (D. Kaki), a tree well worth growing, both for its foliage and fruit, and quite hardy. H. N. Ellacombe, Bitton.

**HARDINESS OF THE PERSIMMON.**—I think you are mistaken in saying in your answer to your correspondent, "W. J. P.," on p. 770 of your last issue, that this fruit tree is not hardy enough for cultivation in the open air in this country. I believe it to be perfectly and absolutely hardy, and able to stand with impunity a far greater degree of cold than anything ever experienced within the bounds of the United Kingdom. My reason for this belief is that by far the finest collection of species and hybrid varieties of Persimmon in Europe is that of a French nurseryman at Greooble, M. Paul de la Mortillière, who has for many years past devoted special attention to the cultivation and improvement of this fruit, and has now a collection of about twenty-five named varieties, most of which are hybrids of his own raising. Now the climate at Greooble is a very severe one, and the winters most bitterly cold, the thermometer frequently falling to 15° below zero, or 47° of frost. No plant that was not absolutely hardy would survive this extreme of cold. The summers, on the other hand, are correspondingly hot, and enable the wood to thoroughly mature and ripen itself. I should therefore think that it is from our summers not being hot enough that the culture of the Persimmon in the open air is not likely to succeed. W. E. Gumbleton.

**THE PHYLLOXERA LAWS.**—We think the following quotation from a letter we received from Italy may be of interest to the trade, and raises a question which we hope you will allow to be aired in your columns:—"The English horticulturists not having made any steps towards the removal of the Phylloxera laws, renders it impossible to import Orchids in any quantities from England into Italy. We get them from France and Belgium without any difficulty." [The question has often been raised in our columns and practically answered in the negative. We suppose the trade knows its own business. Ed.] W. L. Lewis & Co.

**CLEMATIS MONTANA.**—I am sending you a photograph of a plant of *Clematis montana* that I planted on the south side of my cottage in 1891. I purchased the plant of Messrs. Saltmarsh & Son, Chelmsford, and it has flowered freely annually, but this spring it was a perfect picture. There are four large clumps of *Iris acuta* growing in the border, which form a ground-work to the Clematis, and a striking contrast is seen, both flowering at the same time. This free-flowering creeper ought to find a place in every garden. It will grow and flower freely in any situation, and it proves a most valuable plant for covering unsightly objects such as stumps of trees, pillars, as well as verandahs, balconies, &c. As regards pruning, very little more is required than to cut out the dead wood in the spring, and lay in the young, and the most suitable time to do so is from the end of February to the middle of March—as a rule. But it is a bad practice to let the young growths get much entangled, this being the ruin of many a creeper. *C. montana*, as seen in the photograph, is simply trained over a rain water-pipe and tied loosely

here and there, as naturally as possible to wires stretched horizontally below. I may add, that the individual flowers are much improved by giving the plant a thorough soaking of diluted liquid-manure before and after flowering. S. Kerry, Hatfield Priory, Witham. [Very beautiful. Ed.]

DISEASE ON TOMATOS.—I beg to say that the disease on my Tomato plants was not due to heat and moisture combined [favouring the growth of fungi. Ed.], as you noted in last week's Gardeners' Chronicle, because I took the greatest care in keeping the atmosphere as dry as I possibly could. I only watered them once a week, and then it was early in the morning, so that the atmosphere got dry before night; and once I covered the surface with 2 inches of dry mould to prevent evaporation, but still the disease spread rapidly until I shut off the bottom-heat, and kept up a high temperature for two hours for three successive days. Since that was done the disease has ceased to spread, and on every Tomato that was affected the disease dried up, as you will see by the one which I send for your inspection. Some were much more and some less diseased than the one sent, but in every case the disease has completely dried up. I will also mention that I had a few Tomato plants growing in pots, but none of them were affected with the disease, but only those in the beds, and which are kept to one stem, and stand at 12 inches apart in the house. For the past week I have syringed the plants in this house to ascertain if the disease would return by keeping a moist atmosphere, but there is no sign of it, and I have now the healthiest lot of plants I ever saw. I believe the chief cause of disease in Tomatos lies at the roots more than in the air. It may be stable-dung or some other fermenting material on hot-water pipes. A little bottom-heat is of great benefit to the plants, but an excess of it is a cause of disease. [Sometimes, perhaps. Ed.] J. B., Chelmsford.

LITCHES.—Your Belgian correspondent might write to the Queensland Acclimatisation Society, Brisbane, re Litches. Information about all kinds of tropical fruits is obtainable from that association, but I am doubtful, however, if growing stock will be obtainable anywhere. Why not try Colombo for seed? The fruit is fairly abundant there, and it matures in September. C. Bennett, Ivy Cottage, Warblington, Havant.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

JUNE 9.—Present: Dr. M. T. Masters (in the Chair); Mr. McLellan, Dr. Bonavia, Mr. Douglas, Rev. W. Wilks, Dr. Müller, Dr. Russell, Rev. C. W. Dod, Mr. Bennett-Poë, and Rev. G. Henslow (Hon. Sec.).

Experiments in Colouring Flowers.—As a preliminary experiment, Dr. Russell tested the power of the soil to retain the various salts proposed to be used in the case of white Petargoniums. He took two glass tubes, 1 foot in length, and 1/2 inch in diameter, and drawn out at one end. These were filled with soil from a garden, the amount being 8 1/2 cubic inches. He poured in a solution of sulphate of copper (13 grains to the pint, or 1/2 oz. to a gallon). The water which came through was tested; but 4 1/2 pints passed through before any trace appeared, and that only after one month; 56 grains were held by the soil. Similarly with sulphate of iron; 3 1/2 pints of the solution passed through before any iron was present in the water. This took twenty-eight days, so that 47 grains were held by the soil. As an additional experiment, some of the same soil was saturated by shaking it with water; it was then put into a tube similar to the previous ones, and sulphate of copper (13 grains to a pint) poured on as before; 2 1/2 pints passed through before any copper was traceable. This took fifteen days, so that 36 grains were held by the soil. The next experiment was made with ammonium salts. Ammonium nitrate was poured on the soil (13 grains to a pint); 4 ozs. came through before the ammonium salt was found. The soil thus retained 2 1/2 grains. This took only three-quarters of an hour. Ammonium chloride.—With this salt, 5 ozs. passed through before ammonia was detected, therefore the soil held 3 1/2 grains. It ran through in half an hour. The significance of these experiments showed that unless the salts be placed directly in contact with the roots, it might be retained in the soil, and no result would follow.

Prepotency of the Male Parent.—Mr. Douglas brought a very interesting communication on prepotency in crossing Carnations from Mr. Smith of Warren House, Hayes, Kent, of which the following is an abstract:—"One very strong bit of evidence in favour [of the male prepotency] is given by the crosses on 'Germania.' This is a flower of tremendous individuality, and if any flower could transmit its peculiarities to its descendants, it would be this; yet Germania (yellow)

is swamped by the prepotency of the pollen parent in the great majority of cases. I hardly ever get a yellow worth having; but when I do I find them, as a rule, pure reproductions on a most feeble scale of the mother; and I always regard them as products of Germania fertilised by pollen of flowers on the same plant, or from one in the immediate vicinity." Mr. Smith sends a table of crosses in which is Germania (seed parent) x King of Scarlets.—Produce, two yellow-ground Plectes, one yellow self; Germania x Sir B. Seymour; all the produce took after the male parent; G. x a maroon, nearly all the offspring maroons; G. x Mrs. Vernon Harcourt; offspring, five scarlets and one maroon; G. x Ardele gave scarlet, crimson, and rose. "The strongest evidence on the other side is afforded by the produce of Madame A. Warocque x G. I have at one time or another, since 1892, saved nearly ninety plants from this cross, and I never raised a yellow from it; a few buff and apricots, but never a true yellow, by far the largest proportions being scarlets, rose, and crimsons. It seems to me to be easy enough in a cross for other colours to swamp yellow, but quite another thing for yellow to over-ride other colours, unless it exists in both parents. The most it seems able to do is to produce orange and buff." In further illustration of this fact he gives the following cases:—Ruby x G gave two rose (no trace of yellow); Governor (maroon) x G gave one yellow, one buff, two rose, and one crimson; Madame Van Houtte and Ella Murray x G, all the offspring took after the mother. Mr. Smith adds the following interesting fact with "whites":—"When you cross violent contrasts of colour, such as purple and yellow, or scarlet and yellow, you are apt to get a good proportion of whites." He gives as examples:—Coruna (yellow) x Hayes (scarlet); offspring, two whites, one scarlet; Germania (yellow) x purple, gives maroons and whites; G. x N. Murray (scarlet), four out of five were white; Lord Lofton x G. gave four whites, one maroon, three yellow or buff.

Punctures as Skin Irritants.—Mr. Dod observed that besides the well-known case of P. obovata (which, however, has no effect upon himself), he finds P. japonica to be very irritating; and what is more remarkable, the "farina," a secretion of wax on the surface of the plant, produces the same effect, causing blisters on the hand.

Cucurbita Hybrids.—Mr. Bennett-Poë exhibited a plant of C. Pflanzert (♀) x a greenhouse variety of C. orientalis, raised by Mr. Lynch, of the Botanic Gardens, Cambridge, and also a similar cross by himself. The flowers were very different. In the former they were red, whole coloured, the petals long and dependent; in Mr. Poë's they were white, with tips purple, and the buds flatter, more resembling an ordinary garden form.

Cytisus scoparius var. Andreeana.—A question having been raised as to the seed of this variety coming true, Mr. Wilks observed that about one-third came true, but in others the blossom reverted to those of the Broom, but were larger than on the wild Broom. Mr. Henslow exhibited sprays from a seedling which had come true. The plant had been grafted on the common Broom.

Peas Penetrated by Oats.—Mr. Henslow exhibited a specimen—one of many found among Peas—of a Pea which had been hollowed out by a weevil, and then penetrated by an oat. It illustrates, presumably, the remarkable property of penetrating the soil possessed by Oats, fruits of Erodium, &c., which are provided with a spirally-twisted hygroscopic awn. This on becoming moistened twists, and so thrusts the lower end downwards. In this case it happened to penetrate the hollow peas.

Garden Hybrids.—Mr. Henslow described some specimens received from Rev. C. W. Dod, consisting of natural crosses between species of Polemonium, Papaver, and Heuchera. In one case Polemonium flavum x P. ceruleum, the hybrid scarcely differed from the male parent; but in all the others the cross was more decidedly intermediate. The following are a few of the points which showed the proportional intermediate characters. Taking, e.g., P. ceruleum; the hybrid: P. reptans; the length of blades of similar leaves were as 3:4:5. The apex of a leaflet—shortly acute; sub-acuminate; acuminate. Anther elongated, golden yellow; shorter, pale yellow; shortest, white. Size of pollen-grains—2:1.75:1.5, &c. With regard to P. flavum x P. ceruleum, Mr. Dod writes:—"This is the most interesting of the many hybrids of Polemonium which come up in my garden. I have no doubt of the hybrid, because I have carefully saved seed of P. flavum, and the hybrid has shown itself among several sowings. It is interesting because in colour and flower it so nearly follows the pollen parent. The difference in habit is considerable. P. c. has a perpendicular habit of growth, but the hybrid follows P. flavum in being divaricate at the base, the hybrid is absolutely barren, though the parents are both profuse seeders. The hybrid, however, is most prolific in other ways; for any stump of stalk grows readily and luxuriantly." With regard to other characters, the hybrid is more decidedly pubescent than is the stem, &c., of P. c.; but less so than P. fl. The petals of P. c. have a round purple ring at the base of the corolla. In the hybrid this is wanting, as it is also in P. fl., &c. The cross between Heuchera cylindrica, with green flowers, and H. sanguinea, with crimson flowers, is very obvious, the hybrid having rose red flowers. The pollen, unlike that of the parents, was very bad. Though the leaves resembled those of the parents in size, the veining agreed mostly with that of H. sanguinea, the angles between the palm to veins being less acute than is the case in H. c. In the form of the calyx, the hybrid also approximated that of H. s. rather than that of H. c. In Papaver orientale var. bracteatum x P. rupifragum, this hybrid, though decidedly intermediate, approaches P. rupifragum the nearest. Thus while P. or. is bisulcate, P. r. is pubescent. In the cross the hairiness is of an inter-

mediate character. This is well seen in the calyx by the following proportions:—P. or.: Hyb.: P. rupifragum; stiff curved hairs: soft curved hairs: tomentose. The peduncle has corals scattered, as in endogones, in P. orientale; while in the hybrid and in P. rupifragum the peduncle is much smaller, having the corals in a ring. The corolla is scarlet in P. orientale; orange in hybrid and P. rupifragum, &c. Generally speaking, therefore, the hybrid is intermediate, but approximates P. rupifragum. With regard to other hybrid Poppies, Dr. Masters observed that M. Vilmorin had succeeded in crossing P. orientale with P. somniferum, and also with P. Rhæas. Mr. Wilks tried to cross a Shirley with the Iceland Poppy, but the result was identical with the wild P. Rhæas.

The Lek.—Dr. Masters exhibited a curious specimen, in which the leaves were very large, concrescent, and spiral in growth, forming a large sheet.

JUNE 23.—At the usual fortnightly meeting of the committees at the Drill Hill, James Street, Westminster, on Tuesday last, there were decidedly fewer exhibits staged than on the previous occasion. This was owing, no doubt, to the circumstance that the shows now being held in the provinces draw, to a large extent, upon the material for exhibition purposes at the museums. Possibly there were not fewer novelties present, but the exhibits of ordinary miscellaneous plants occupied a smaller space than has been the case lately. There was an excellent display of Sweet Peas, and the competitive classes for hardy flowers brought some very creditable collections, all of them exhibiting capital culture. The finest exhibit of Calochortus from Messrs. WALLACE we remember to have seen in the hall also deserves special mention. Several collections of fruit exhibited good cultivation, but there was nothing new on this occasion deemed of sufficient value to merit an award. A considerable number of awards were made by the Floral Committee, as will be seen below. Orchids occupied much less space than usual, but a number of novelties were before the committee.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. G. H. Engleheart, H. B. May, R. Dean, H. S. Leonard, J. F. McLeod, R. B. Lowe, Chas. E. Pearson, W. Bain, Thos. Peed, Geo. Gordon, J. W. Barr, J. T. Bennett-Poë, H. H. D'Ombraih, H. Herbst, Jas. Walker, and Jno. Jennings.

Mr. A. PERRY, Winchmore Hill, exhibited several interesting hardy flowers, including a fine new Geum called Helbrechii, having single flowers of about an inch and a half across, fiery scarlet (Award of Merit); a semi-double variety of this was also shown. Erigeron glaucus and Agrostemma Walkeri were well shown, several varieties of Lilium Davuricum, and a bunch of Linaria alba, small white blossoms disposed on slender terete stems. Two plants of an ornamental variety of Coleus named Mrs. Dashwood were exhibited by Mrs. DASHWOOD, Crayford (gr., Mr. G. A. Gardner); and Messrs. DOBBIE & Co., Rothesay, had three plants of Oxloxia Aigburth Gem, having velvety crimson flowers, with pale spotted throat.

Messrs. DOBBIE & Co. also exhibited a number of varieties of auricula-eyed SWEET WILLIAMS, and sprays of a new and excellent yellow flowered Antirrhinum, named Yellow Queen.

Tuberous Begonias were but little shown. Messrs. JOHN LIVING & SONS, Forest Hill, London, S.E., exhibited a very handsome plant in a wire basket. The variety was Richard's's Favourite Basket Begonia. It produces large, double, rosy-crimson flowers, and appears to be specially suited to this method of culture. A single flowered variety named Bitterfly, and a double one named Marchioness of Downshire, were shown in pots. The former has a silvery ground, striped and marked promiscuously with scarlet. The latter is intense crimson.

Mr. HENRY ECKFORD, Weir, Shropshire, made an excellent exhibit of Sweet Peas in glasses, which, in the uncrowded state of the hall, did not suffer from being placed too closely together. The varieties, as is now well known, exhibit a multitude of pleasing shades, and the form and size also differ considerably. Some of the newer ones staged were Salopian, a crimson flower, with standard stained with purple, large size; Queen Victoria, pale cream colour, very exquisite; Prince Edward of York, an exceptionally bright rosy-pink flower, attractive and very effective; Coquette, a variety which opens Primrose colour, afterwards becomes paler, and assumes slight stain of mauve; Triumph, a large flower with rose coloured standard, and pink wings; and Lady Nina Balfour, pale lilac blue. There were about fifty glasses in all (Silver Flora Medal).

Three plants in flower of Dimorphotheca Eckloni were shown by W. G. SOPER, Esq., Harestone, Caterham Valley, Surrey. The plant produces large Marguerite-like white flowers with a blue disc.

Roses were exhibited by H. V. MACHIN, Esq., Gateford, Derby, Worksop. The blooms were staged in six or more boxes, and represented considerable variety. It is remarkable that the collection from Mr. Machin constituted the only Roses present (Silver Flora Medal).

A new dwarf growing white Marguerite named nivalis compacta was shown by Mr. H. B. MAY, Tyson's Lane Nurseries, Upper Edmonton. A number of the plants were shown in a basket. They appeared to be very floriferous, and much more compact in habit than the type (Award of Merit).

Mrs. NORTH, Eltham, Kent (gr., Mr. Geo. Abbey), showed sprays of a Seedling Pansy, named Col. J. T. North. The flowers were small and of a very bright and distinct colour. If the habit be good, the variety is a desirable one.

Messrs. YOUNG & ROBERTSON, Stevenage, Herts, exhibited a collection of hardy flowers of some extent (Bronze Banksian Medal).

Messrs. JAS. VEITCH & SONS, Chelsea (Silver Banksian Medal), exhibited flowering sprays of *Escallonia Philippiana*, *Cytisus nigricans*, *Androseda speciosa cassinefolia*, *Acacia neo-mexicana*, with flowers like those of *A. hispida*, but smaller, and the bunch more dense; *Cornus stricta*, and *Meliosma myrtilloides*, a shrub with pale green, chestnut-like leaves, and white Spirea-like flowers. A plant in bloom of the pale mauve-coloured *Ostrowskia magnifica* was shown; and a plant of *Canna Italia*, a magnificent variety, with large, finely-formed flowers, having a yellow ground, with orange-scarlet markings (Award of Merit).

Messrs. IVERY & SON, Dorking, exhibited two plants in flower of a single blue flowered Clematis named Lady Ashcombe; and from the Duchess of ALBANY'S garden at Claremont (gr., Mr. E. Burrell), were exhibited three shoots and flowers of *Magnolia macrophylla*. The flowers of this species were very large, and cream-coloured.

Mr. Rapley, gr. to Mrs. GAINING, Harrow Weald House, Stanmore, showed a fine velvety-crimson variety of *Gloxinia*, with exceedingly good habit; and Messrs. HURST & SON, Houndsditch, on behalf of the Sunset Seed & Plant Co., San Francisco, exhibited a variety of Sweet Pea of rosy pink colour, named Red Riding Hood.

An exhibit of an unusual character was that from Messrs. HORN LOW & CO., Clapton. It consisted of well grown plants in flower of *Statice profusa* and *S. Butcheri*, the latter being a darker-flowered variety.

Messrs. F. SANDER & CO., St. Albans, exhibited a magnificent pan of the fine foliage plant *Eriocoma candida*, and were awarded a First-class Certificate for *Anthurium Andreanum*, Kelly's var. This is a very large-growing variety in all its parts. The spathe is large and of pretty flesh colour, and borne on a very long stem. The firm also obtained an Award of Merit for a new dwarf-growing *Asparagus*, viz., *A. tenuissimus*, var. *Albanensis*.

A magnificent display of the larger flowered varieties of *Calochortus* was made by Messrs. WALLACE & CO., Colchester. An Award of Merit was given to a number of varieties to be known as the Eldorado strain, a beautiful group of flowers, differing slightly from each other in regard to colouring. Another group of varieties obtained from a district some two hundred miles from the place where the Eldorado strain was obtained, was also noticed. These have flowers with more or less of coppery colour in them, and are very distinct and pretty. *C. venustus* in its many named varieties was well shown, the variety *citrinus* being especially pretty. *C. v. vesta*, *C. v. v. albus*, and *C. v. roseus* were to be seen also, and *C. luteus concolor*, a capital yellow variety, should be mentioned. *C. nitidus* is a species producing six or eight flowers on a scape. They are of pale mauve, and are distinct in possessing a few exceptionally long hairs in the interior. *C. Gunsoni* a white flowered species inclined to green at the base of the interior, and *C. splendens* were remarked. There was a variety of the latter named *atroviolacea*, but it appeared less pretty than the type. A few *Brodiaea*s and many varieties of *Lilium Thunbergianum* were likewise exhibited (Silver Flora Medal).

From ARNOLD MOSS, Esq., King William Street, came a white Iris, under the name *I. Angelica Mont Blanc*; and from C. F. THOMPSON, Esq., Swansea, was exhibited some flowers of *Alstroemeria splendens*.

Messrs. P. BARR & SONS, King Street, Covent Garden, made a very large exhibit of hardy flowers now in season. The collection contained numbers of fine Delphiniums, Sweet Peas, and Violas. Iris Kamperferi and other species were represented by numerous varieties. I. K. var. Chigo obtained an Award of Merit. It is a very effective flower, all the six segments being of equal large size. They are blue with a yellow feather at the base surrounded with white. Gaillardias, Agrostemmas, Poppies, Veronicas, *Dianthus barbatus* magnificus, and many other things were noticed, including the pretty light purple flowered *Allium acuminatum Murrayanum*. (Bronze Banksian Medal.)

A very interesting exhibit was made by Sir TREVOR LAWRENCE, Burford, Dorking (gr., Mr. Bain). This included several *Alstroemeria* seedlings, also flowers of *Crinum Powellii* alba, and *C. Mackoyanum*, both of them hardy species. *Anthurium* seedlings included one named *A. Lawrenceanum*, a variety with a large handsome white spathe and white spadix (First-class Certificate). A similar award was given to *Astibe chinensis*, also exhibited by Sir T. LAWRENCE. This is a species from Central China, grows about 2 ft. high. It has ovate-oblong leaves nearly 2 inches long, much serrated, and pubescent on under surface. The flowers as shown are pale mauve or white, small, rather sparsely placed on long corymbs.

An Award of Merit was recommended to a white flowering Carnation with clove fragrance named Hope. It was exhibited by J. WYNNE FROUCKES, Esq.

#### COMPETITIVE EXHIBITS.

The 1st Prize in the competitive class for a collection of hardy flowers of not fewer than eighteen bunches was awarded to Mr. M. PEITCHARD, nurseryman, Christchurch, Hants, who made a very effective bank of bloom with varieties of considerable interest and merit, the cultivation of most of them being remarkable. *Scabiosa caucasica* was splendid, and the white variety was exhibited, but this is

less attractive than the type. The double variety of *Campanula persicifolia*, and the white variety of *Polemonium Richardsonii* were noticed. Other good things included, were *Hemerocallis Thunbergii*, *Cephalaria alpina*, *Funkia Sieboldii*, *Alstroemeria aurantiaca*, *Helenium pumilum*, *Eryngium Olivarianum*, several good varieties of herbaceous Phloxes, *Catananche bicolor*, &c.

Messrs. P. BARR & SON, King Street, Covent Garden, were 2nd, and also staged an exhibit containing many interesting species.

The best exhibit of twelve bunches of hardy flowers, distinct species (amateurs) was that from Mr. C. HERRIN, The Gardens, Dromore, Maidenhead. His collection was very fine. The collection included *Delphinium Belladonna*, *Verbascum Chalcidii*, *Campanula persicifolia* alba, *Lathyrus grandifolius*, *Clematis recta*, *Gaillardia grandiflora*, *Spirea japonica* and *Lilium caudatum*. The 2nd prize was obtained by Mr. G. H. SADE, The Gardens, Ham House, Richmond.

The remaining competitive class, viz., that for eight bunches (amateurs) was won by Miss DEBENHAM, St. Peter's, St. Albans. In this collection we noticed *Erigeron speciosus*, *Lychnis vespertina* alba fl. pl., *Campanula coronaria*, *Alstroemeria*, and a nice bunch of the Ernest Ludham Pick

#### Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), De B. Crawshaw, H. M. Pollett, H. Ballantiae, W. H. Frotheroe, John Gabriel, H. J. Chapman, W. H. White, Edw. Handley, W. Cobb, Jas. Douglas, S. Courtauld, T. B. Haywood, and A. H. Smee.

The show of *Oreobelis* at the Drill Hall has been better, and larger sustained this season than in any former year, and the displays have been good in quality, and of great extent. The present show experienced the falling off in the number of the exhibits which is invariably the case at midsummer, and fewer entries were made of plants to go before the committee. Some few remarkable ones, however, were staged, and notably the beautiful dark scarlet *Rensanthera storiei*, which may be likened to a large form of the fine old *R. coccinea*, exhibited in Sir TREVOR LAWRENCE'S group, and a fine inflorescence of which, with several branches, was sent by W. J. THOMPSON, Esq., Ghyllbank, St. Helens, who received it from the Philippines.

In Sir TREVOR LAWRENCE'S group (gr., Mr. White) also were a fine specimen of *Rhynchostylis retusa* (*Saccolabium guttatum*) with twelve spikes; a very handsome light form of *Miltonia vexillaria* with six spikes; a profusely flowered plant of the small, and pretty, white flowered *Cirriopetalum nutans* (Botanical Certificate); a splendid plant of *Cypripedium superbum*, with nine flowers, which had not received recognition from the Committee before, secured a First-class Certificate; a fine example of *Catasetum Bungeothii*, the rich mauve-crimson coloured *Epidendrum Frederici-Guilielmi*, and the singular looking *Epidendrum variegatum*; *Acridies multiflorum* Lobbi, *Dendrobium crystallinum giganteum*, &c. (Silver Flora Medal).

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, also received a Silver Flora Medal for a magnificent group of rare and tastefully arranged Orchids, the most prominent of which were *Laelio-Cattleya* × *Cambiana* alba, a noble flower with clear white sepals and petals, and large violet purple lip; *L. C.* × *Endora* (V. Mendelii × *purpurata*), recently certificated to C. L. N. Ingram, Esq., who again exhibited it as *L. C.* × *regalis*. It is the same as that which W. R. Lee, Esq., first exhibited at Manchester as *L. C.* × *Apophite*, which by right of priority should be its name; *L. C.* × *extima*, one of the oldest, but still one of the finest of garden hybrid *Laelio-Cattleyas*; *L. C.* × *Hippolyta*, of rich Indian yellow colour, with ruby lip; the singular and pretty rose blue *Cattleya Schroderiana* Rehb. f.; fine panicles of *Disa* × *Langleyensis*, and *D.* × *Kewensis*; *Cypripedium* × *Brysa*, *C. Curtisii*, *C. ciliolare*, *C. niveum*, *C. volutatum*, *Cattleya citrina*, *Odontoglossum Harryanum*, and other good *Odontoglossums*; *Phalænopsis amabilis*, &c.

THE DUKE OF SUTHERLAND, Trentham (gr., Mr. P. Blair), was awarded a Silver Banksian Medal for *Odontoglossum crispum* "Duke of Sutherland," one of the finest ever exhibited, not only for the excellence of its large, perfectly-formed, white flowers, but for the noble size of the plant. It was one of the earliest importation (perhaps twenty-five years ago), and its splendid culture reflects great credit on Mr. Blair, who has had it in his care for a very long time, this being but a sample of many such at Trentham.

W. S. ELLIS, Esq., Hazelbourne, Dorking, showed a small group, in the centre of which was a good specimen of *Cattleya Warscewiczii*, and a well-flowered *Lycaste Dopei*; ranged around them being some of the fine *Odontoglossum crispum*, for which Hazelbourne is now noted. *O. crispum virgiale* "Ellis' var." was a pure white, like the original, but with chrome yellow and orange disc to the lip; and *O. E. guttatum* Hazelbourne var., a very pretty spotted form (Vote of Thanks).

Messrs. F. SANDER & CO., St. Albans, had an interesting group, the most remarkable plant in which was *Cypripedium* × *Neptune* (to grande × *Rothschildianum*) a very bold-looking hybrid of the *C.* × *Massianum* class, with large pale green flower, the petals of which were extended like those of *C. Rothschildianum*, and finely blotched with purple (Award of Merit). Other good things to the group were *C.* × *Uranus* (*Lindleyanum* × *grande*), much resembling *C. Sargentianum*; *Angreecum Chailanum*, *Cirriopetalum picturatum*, *Phaius Humboldtii*, *P. Owenianus*, *Sobralia* × *Veitchii*, *S.* × *Auesie*, and *S. xantholeuca*, some very good *Cattleyas*,

*Laelia tenebrosa*, *Odontoglossum Harryanum* and other *Odontoglossums*, *Oncidium triquetrum*, *Thunia* × *Veitchii inversa*, &c. (Vote of Thanks).

WALTER C. WALKER, Esq., Percy Lodge, Winchmore Hill (gr., Mr. Geo. Cragg), showed *Stanhopea Wardii*, *Cattleya Warscewiczii* var. *Claudia*, very richly coloured; and C. W. Walker's var., a very large, light-coloured variety, and cut spikes of *Dendrobium suavisimum*, *Cattleya intermedia*, *C. granulosa*, and the yellow-petalled *C. g. Dubuyssonii* (Vote of Thanks).

W. G. SOPLA, Esq., Harestone, Caterham Valley, showed *Gongora maculata* (Botanical Certificate).

Messrs. HORN LOW & CO. staged fine varieties of *Cattleya Mossiae*, of which *C. M. bella* was a very distinct form, with almost wholly rich crimson-purple lip; also *Dendrobium chlopterum*, an Australian species, with greenish flowers with a few purple lines, the habit of the plant and the manner of producing its flowers being somewhat like *D. atroviolaceum*.

W. THOMPSON, Esq., Walton Grange, Stone, Staffordshire (gr., Mr. W. Stevens), sent *Laelia tenebrosa gigantea*, the largest flowers of the species yet exhibited, and rich in colour; and *Odontoglossum* × *Coradii* expansum, also very fine. Mr. N. BLANDFORD, Bittene, Southampton, showed *Cattleya Warscewiczii*.

H. GRINLING, Esq., Harrow Weald House, Stanmore (gr., Mr. Rapley), sent *Cattleya Warscewiczii imperialis*, and *Dendrobium Parishii*.

Sir FREDERICK WIGAN, Clare Lawn, East Sheen, Richmond (gr., Mr. W. H. Young), showed *Miltonia vexillaria Chelmsiensis*, a pretty variety with purple rays as in Baron Schroder's *M. v. radiatum*; and J. B. WALMSLEY, Esq., of Liverpool, sent a cut spike of *Acridies radicosum album*, a very pretty white form of the plant generally known as *Acridies rubrum*.

#### Fruit Committee.

Present: Philip Crowley Esq., in the chair; and Messrs. T. F. Rivers, Jos. Cheal, Geo. Bunyard, Henry J. Pearson, A. F. Barron, T. J. Saltmarsh, J. Wright, Alex. Dean, Chas. Herrin, T. H. Crisp, T. Glen, Jas. H. Veitch, G. H. Sage, Geo. Wythes, F. Q. Lane, J. Smith, Robt. Fife, and G. Norman.

A collection of 14 fine fruits of Queen Pine-apple was exhibited by the Rt. Hon. F. J. SAVILE FOLJAMBE, Osberton, Worksop (gr., Mr. T. H. Crisp), also a number of fruits of a Melon named Osberton (Silver Knightian Medal).

A collection of Strawberries in about twenty-five varieties was shown from the gardens of H. M. THE QUEEN (gr., Mr. O. Thomas). The fruit exhibited first-class cultivation. Cherries also in eighteen varieties were very fine, but some of them hardly ripe. Seventeen fruits of Cucumber Frogmore Prolific were exceptionally good, and there was also a dish of smooth yellow fruited Tomatos named Royal Windsor (Silver Banksian Medal).

A dozen excellent fruits (large and well coloured) of Lord Napier Nectarines were exhibited by the Duke of SUTHERLAND, Trentham Hall (gr., Mr. P. Blair); half-a-dozen fruits of a seedling Melon named Gem were from Mr. Wythes, gr. to Earl FROBY, Syon House, Brentford.

Mr. ALFRED BISHOP, Westley Hall, Bury St. Edmunds, exhibited a large scarlet fleshed Melon, weighing 14 lb., and named Royal Horticultural Society, also a green-fleshed variety named Westley Delancey.

Another seedling Melon, named Highlands Gem, was shown by Mr. J. F. WILKINSON, Highlands, Minchin Hampton. None of the Melons at this meeting were considered by the Committee of sufficient flavour to merit an award.

A seedling Strawberry, named Jno. Cox, was shown by Miss Cox, from Ryde, Isle of Wight.

R. DAWES, Esq., Edmonscote House, Castle Hill, Ealing, exhibited a yellow-fruited Tomato, named Edmonscote Favourite, but the fruit were not of the fine smooth character that is nowadays looked for.

Messrs. J. VEITCH & SONS, King's Road, Chelsea, exhibited a collection of about seventeen varieties of Peas, with interesting particulars respecting the date when the varieties were sown, and also when they were fit for gathering. All of the varieties were sown on the 15th of April, and Veitch's Selected Extra Early were gathered on June 17, others were ready on the 19th. William the First was not fit for gathering until the 22nd, the same date on which "Pluperfect Marrow," a fairly large, good flavoured Marrow-fat turned in.

Mr. H. ECKFORD, Wem, Salop, showed pods of a new early Marrowfat Pea named Pioneer. It was ready for gathering on June 9, grew about 5 ft. high, and has large pods.

Messrs. LAXTON BROS., Belford, exhibited a fine lot of fruits of the Strawberry Laxton's Monarch; and Mr. J. READ, The Gardens, Brentley Park, Burton-on-Trent, had three fruits of a seedling Melon.

Messrs. E. S. SARGANT & CO., Worthing, again exhibited a collection of Melons, including nearly forty fruits. Varieties of the extraordinary netted forms noticed at the last meeting were to be seen in this exhibit also. Excellent Capsicums were shown by this firm, as also some very fine Cabbages.

From Messrs. BARR & SON, King Street, Covent Garden, were exhibited some good Lettuces, including a variety with distinct appearance known as Asparagus Lettuce. There were some capital cabbages also, among which was a variegated one.

#### Lecture on Gardeners.

In the afternoon a lecture entitled "Gardeners, Past, Present, and Future," was delivered by Mr. S. HEATON, Horticultural Instructor under the Hants County Council. In speaking of gardeners past, the lecturer took occasion to

mention facts concerning the lives of several horticultural pioneers, such as John Hill, Jno. Gerarde, Geo. London, Wise, Stephen Switzer, Philip Miller, Jno. C. Loudon; and of later gardeners Sir Joseph Paxton and Shirley Hibberd. A few quotations were also given from Miss Amburst's *History of Gardening*. Of gardeners present, it was said that although very rapid strides had lately been made in the development of horticulture, and in the education of gardeners, there were many still to be found who could neither write nor read, but who were of opinion that they knew sufficient of everything, and that anything of which they had no knowledge was not worth the knowing. A few remarks were made upon Cottage, Amateur, Market, Professional, and Gentleman's gardeners. Of the last-named class Mr. Heaton had formed a considerable idea of their individual possibilities, and after enumerating the qualities usually looked for in such men, declared that he considered a really typical gentleman's gardener to be one of England's greatest sons. Of Lady gardeners the lecturer informed us, he had had no experience. Concerning gardeners of the future, Mr. Heaton's remarks amounted to a plea for the better preparation of the young men by additional education, and it was urged that more interest should be taken on the part of head gardeners in the teaching and welfare of the probationers under their charge. Several incidents in the lecturer's own career were related, in which he had been discouraged by his superiors from acquiring anything beyond a rule-of-thumb practice. Suggestions upon the varying circumstances which frequently operate against a gardener's advancement were given, and hints upon how to overcome them. The usual long list of 'ologies said to be needful to the gardener were again recommended, and an appeal made to the Royal Horticultural Society to extend their examinations until they are accessible to all gardeners wheresoever they are situated.

THE NATIONAL VIOLA.

JUNE 20.—On the above date the first exhibition of the newly-organised National Viola Society took place in the Royal Botanic Society's Gardens in the Regent's Park, the glass corridor in which the spring shows of the society are held, being utilised for the purpose. Tables ran down each side of the corridor, but they were only partly filled, and in consequence looked very poorly furnished. It would have been better to have had a single line of tables running down the centre, as that would have contained all the exhibits, and the effect would have been heightened. Had the exhibits been spaced out somewhat, the tables would also have appeared better filled, but it was not done. The bunches or sprays of Violas generally arranged on fan-shaped and other plush-coloured stands, were very effective; the large collections of show and fancy Pansies from the north were very gay, though, as staged on this occasion, they had a flat and monotonous appearance. Many of the fancy Pansies showed the effects of the dry weather, and also of passing storms, which had defaced their beauty; roughness was discernible in many of the flowers, but the general character of the spring had been much against good development. Happily the weather was cloudy and the day cool, or the heat of the corridor would have shrivelled many blooms by midday.

VIOLAS.

In the open classes, that for an unlimited collection three competitors appeared, the best being Mr. S. PEE, Gatherall, Garstang, whose collection consisted of some 200 sprays of six or more blooms of one variety, and they were placed in small metal vessels fastened to green stands, each division of stands having five shelves painted green, thus affording five tiers of sprays; this is a convenient way for setting them up. Among some promising new varieties were *Lightning*, maroon, with segments of mauve to each petal, good shape, and distinct; *Isa Ferguson*, glossy dark lower petals, the upper silvery-mauve, with a dash of mauve on each of the lower petals; *Sheelah*, white, tinted with pinkish cerise, dark centre; *H. W. Stewart*, a mixture of maroon and crimson, flaked with white and rosy-white; *Lady Salisbury*, white, with dark-blue pencilled lines round the eye; *Queen of the Year*, a pale mauve self, some of the blossoms faintly flaked with white; *Silver Bar*, white, with purple flakes and stripes radiating from the eye, large flowers; *Gold Crest*, yellow, small, a rayless variety; *Mary S. Howard*, white, large yellow centre, and delicate pink top petals; *Mrs. C. T. Gordon*, florized, delicate mauve; *Bull on a good old deep-yellow variety*; *Cherry Park*, white; *Mrs. Crane*, plum-purple lower petals; *Colleen Bawn*, white; *Admiration*, deep purple; *Marchioness*, white; *Princess Beatrice*, Charm, *Blush Queen*, *Christiana*, *Miss Gibson*, *Duchess of Sutherland*, &c. Mr. JOHN FORBES, Buccleuch Nurseries, Hawick, was 2nd, with about eighty-four bunches, the best being *Lord Fitzgerald*, *Bridal Wreath*, *Colleen Bawn*, *Cecilia*, *White Flag*, *Lord Elcho*, *Eynsford Gem*, *Mary Gilbert*, *W. Haig*, *Archie Grant*, *Lady Reay*, and *Miss Melville*.

With twenty-four sprays, distinct, Mr. JOHN SMELLIE, florist, Bushy, Glasgow, was 1st, having well-developed blooms of *Lord Salisbury*, *Jessie Pretswell* (new), a striped variety; *Princess Beatrice*, *Cecilia*, *Duchess of Fife*, *White Flag*, *Cherry Park*, *York and Lancaster*, striped; *Lady Salisbury*, *Commodore*, *White Duchess*, *Cissy Mellows*, *Lemon Queen*, *Iona*, *Goldfinch*, *Mrs. Hay*, *Mary Gilbert*, *Liz. Barron*, *Mary Jack*, *Peggy Smith*, *Colleen Bawn*,

*Hibernia*, and *W. Neil*. Mr. W. BAXTER, florist, Woking Village, was 2nd, his leading varieties being *Cottage Maid*, *W. Neil*, *Iona*, *Norah May*, *Florized*, *Cherry Park*, *Iara*, and *Charm*. Messrs. J. CHEAL & SON, nurserymen, Crawley, were awarded a 3rd prize.

With twelve sprays, Mr. W. BAXTER took the 1st prize, the best being *Iona*, *Princess Beatrice*, *W. Neil*, *Christian*, *Duchess of Fife*, *Norah May*, and *Border Witch*; Mr. J. SMELLIE was 2nd; and Messrs. J. CHEAL & SONS, 3rd.

With six bunches of rayless variety, Mr. J. SMELLIE was 1st, having *Border Witch*, *Mary Scot*, *George Lord*, *Dorothy*, *Nellie*, and a seedling; 2nd, Mr. W. BAXTER; and 3rd Messrs. J. CHEAL & SON.

With six sprays of rayless varieties, miniature type, Mr. W. BAXTER came in 1st, having unnamed seedlings. Two others were disqualified, their flowers being, in one or two instances, beyond the prescribed size. The best three varieties of yellow Violas came from Mr. J. SMELLIE, having *A. J. Rowberry*, *Prince of Orange*, and *Mary Gilbert*. Mr. BAXTER was 2nd, and Mr. J. FORBES 3rd.

The best three white varieties came also from Mr. SMELLIE; he had *Niphetos*, *Colleen Bawn*, and *Lady Salisbury*. Messrs. BAXTER and FORBES were again 2nd and 3rd.

Mr. W. BAXTER had the best three sprays of any other colour, staging *Iona*, *Goldfinch*, and *Milkmaid*. Mr. J. SMELLIE came 2nd with *Mary Jack*, *Cissy Mellows*, and *Jessie Pretswell*. Mr. W. HAYES, Highgate Hill, was 3rd.

PANSIES.

*Open Classes*.—In that for a collection of Pansies, there were two exhibitors; Mr. M. CAMPBELL, florist, Blantyre, N.B., and Mr. S. PYE. The former staged nine boards each of fancy Pansies, fresh and bright; and one board of twenty-four show Pansies. Of the former some of the finest were *Maggie Watson*, *George Sprout* (new), Mr. E. Stewart, *James Stewart* (new), *W. H. Clarke*, *Beauty*, *Annie Ross*, *James Campbell*, *J. Cramy* (new), *Neil Hutchison*, *Mrs. D. Johnstone*, *Dr. Jameson* (new). Very fine: *Mrs. C. E. Seace*, *Annie Ross*, *Thomas Gardiner*, *Marmion*, *D. G. McKay*, and *Col. M. R. G. Buchanan*. Of show varieties, yellow-grounds, *Alfred Johnston*, *P. C. D. Boswell*, *Dan Ferguson*, *C. C. Gordon*, *Sinclair Miller*, and *A. Fred West*; white-ground, *Robert Gardiner*; dark self, *Allan Stewart*, *Andrew Wenley*, and *W. Fulton*; yellow self, *Mrs. J. Hunter*, *Royalist*, and *Bella Wilson*; white self, *Mrs. M. S. Pye* took the 2nd prize, having twelve boards of twenty-four fancy Pansies, but many of the otherwise fine blooms somewhat rough and affected by the weather; and six boards of twenty-four show Pansies; but the system of naming adopted by Mr. Pye made it very difficult to identify the varieties.

*Fancy Pansies*.—Mr. CAMPBELL also had the best twenty-four fancy Pansies, staging *Mrs. W. Steele*, new, and very fine; *Mrs. Maundred* new, *Maggie A. Scott*, *Mr. D. Johnstone*, *Col. M. R. G. Buchanan*, *Lord Salisbury*, *Annie Ross*, *Mr. Stewart*, *John Jackson*, *Thomas Gardiner*, *Maggie McPhail*, *Lord Hamilton*, *Mrs. W. Watson*, *Bernard Donlon*, *Geo. Anderson*, *James Stewart*, *Agnes Mabel*, and *George Street*—a very fine lot indeed, and the collection may be taken as representing some of the finest varieties in cultivation. 2nd, Mr. J. SMELLIE, whose best flowers were *Maggie Watson*, *David G. McKay*, *Mrs. W. Steele*, *Maggie Goodiet*, *Jeanie R. Ker*, *Marmion*, *David Russell*, *J. P. Rae*, *Bessie Stuart*, *Lord Dunraven*, and *Britannia*. Mr. C. KAY, Garganock, N.B., was 3rd.

Mr. SMELLIE also had the best twelve varieties, and Mr. CAMPBELL was 2nd, repeating varieties already named. The only exhibitor of twelve blooms, in two varieties, six blooms of each, was Mr. J. SMELLIE, who had *D. G. McKay* and *Marmion*.

*Show Pansies*.—Mr. SMELLIE was 1st with twelve distinct Show Pansies, having dark self: *Wm. Maxwell*, *Dr. Inch*, and *Sir Wm. Arrol*; yellow self: *Nellie Smellie*, very good; white self: *White Bushy* and *Miss A. Ian*; yellow-grounds: *John Brand*, *P. C. D. Boswell* and *R. M. Wenley*; white grounds: *John McLeellan* and *Mr. Brown*; Mr. M. CAMPBELL was 2nd, having a fine dark self in *Huntbill Gem*, of excellent shape, and handsomely shaded.

AMATEURS' CLASSES.

*Fancy Pansies*.—There were two collections of twelve varieties: Mr. CHARLES KAY was 1st, and Mr. LOVATT, Newport, Salop, 2nd. No Show Pansies were staged in this division.

*Violas*.—These were well shown by amateurs, and in the class for twelve sprays there were five competitors. Mr. H. A. NEEDS, Holsell, Woking, was 1st, having fresh, well-developed sprays of *H. W. Stewart*, *Norah May*, *Christiana*, *Archie Grant*, *Iona*, *Goldfinch*, *Purple Empress*, *Wonder*, *White Duchess*, *Duchess of Fife*, *Cherry Park*, and *Princess Beatrice*. Mr. D. B. CRANE, Archway Road, Highgate, was 2nd, also with admirable sprays, *Nellie*, *Cottage Maid*, *A. J. Rowberry*, *Florized*, and seedlings. With six sprays, Mr. J. SHELTON, South Woodford, was 1st, having *White Duchess*, *Duchess of Fife*, *Goldfinch*, *Ardwell Gem*, and *J. B. Riding*. 2nd, Dr. SNACKLETON, West Hill, Sydenham. In another class for six sprays, three blooms in each, Mr. G. W. COOK, North Finchley, was 1st, and Mr. LEONARD BROWN, Brentwood, 2nd.

With three sprays of yellow varieties, Mr. H. NEEDS was again 1st, having *A. J. Rowberry*, *Lemon Queen*, and *Lizzie Lindsay*. Mr. A. J. ROWBERRY was 2nd, with three sprays of white varieties. Mr. NEEDS took the 1st prize, having Countess of Hopetoun, *Vestal*, and *Christiana*. Mr. A. J. ROWBERRY was 2nd. Mr. NEEDS had the best three of any other colour, staging *Florized*, *White Duchess*, and *Goldfinch*, but

should have been disqualified, as what was required by the schedule was three varieties of the same colour. Mr. D. B. CRANE was 2nd.

The class for six bunches of rayless varieties brought no competition, and in the class for six bunches of rayless varieties of the miniature type, the flowers not to exceed 1½ inch in diameter, Mr. A. J. ROWBERRY was 1st with *Lynette*, *Orange Queen*, *Violetta*, *Queen of the Year*, *Olivetta* and a seedling; Mr. D. B. CRANE was 2nd with unnamed seedlings.

In the way of miscellaneous exhibits, Messrs. DOBBIE & CO., nurserymen, Orpington and Rothsay, had sprays of fancy Pansies, Violas, and Sweet Peas; and Messrs. BARR & SON, King Street, Covent Garden, had a collection of bunches of Violas.

As far as could be ascertained, but one Certificate of Merit was awarded to a seedling, viz., *Lavender King* (D. B. CRANE), of a soft lavender tint, but the blossoms lacked both form and stoutness.

NATIONAL ROSE SHOW AT READING.

JUNE 24.—The visit of the National Rose Society to Reading on Wednesday last, in connection with the local Horticultural Society, was a distinct success. None of the classes lacked competition, some of them contained an uncommon number of entries. In the opinion of the secretaries of the society, as expressed at the luncheon given by the Chairman of the Reading Society (Mr. F. J. Ferguson), the exhibition was probably as large as any that has previously been held in the south of England. The quality of the Roses is a different matter, and we think there have been many exhibitions at which the general character of the blooms has been equal, and even superior, to that observed on Wednesday. Still, it was satisfactory to see such quality as did obtain after the very trying time Roses have passed through. The class in which the 1st prize was Messrs. SUTTON'S Silver Cup was exceedingly popular, as may be seen below. The historic site where the exhibition was held proved to be most suitable, and the large tent which contained the whole of the exhibits was erected over a series of grass terraces, upon which most of the boxes were placed. There was need for very little tabling. The weather was fairly propitious.

The best class was one for forty-eight blooms, single trusses (nurserymen), and it was won by Mr. B. R. CANT, Colchester. The blooms were *Duchesse de Morny*, Dr. Sawill, *Caroline Testout*, *Abel Carrière*, *Her Majesty*, *Xavier Olibo*, *Alfred Colomb*, *Lady Mary Fitzwilliam*, *Auguste Rigotard*, *Marchioness of Dufferin*, *Madame Henrie Peireire*, *Mrs. Jno. Laing*, *Victor Hugo*, *Marchioness of Lorne*, *Suzanne Marie Rodocanachi*; 2nd row, *Ba oness de Rothschild*, *Ho ace Vernet*, *Gustave Piganneau*, *Marie Baumann*, *Madame Victor Verdier*, *Mons. Nonan*, *Chas. Lefebvre*, *La Fraicheur*, *Fisher Holmes*, *Madame E. Verrier*, *A. K. Williams*, *Jeanmie Dickson*, *Earl of Dufferin*, *Madame Hoste*, *Maurice Bernardin*, *Maman Cochet* (extra good, Silver Medal), *Madame Crapetet*, *Baroness de Rothschild*. Front row: *Comtesse de Ludre*, *Kaiserin Augusta Victoria*, *Duke of Teck*, *Thos. Mills*, *Prince Arthur*, *The Bride*, *Prince C. de Rohan*, *Camille Bernardin*, *Jean Soupart*, *Madame Cusin*, *E. Y. Teas*, *Ulrich Brunner*, *Madame Gab. Luizet*, *Dr. Andry*, and *Edith Gifford*. Messrs. HARKNESS & SONS, Bedale, Yorks, were 2nd, and staged a good collection. Particularly fine were *A. K. Williams*, *Comte de Raimbald*, *Horace Vernet*, *Earl of Dufferin*, *Marchioness of Dufferin*, and *Madame Cusin*. Messrs. FRANK CANT & CO., Colchester, were 3rd, and there were several other competitors.

The winners of the class for twenty-four, single, were Messrs. JAS. TOWNSEND & SONS, Lower Broadhath, Worcester. *Louis Van Houtte*, *Prince Arthur*, *Heinrich Schultheiss*, *A. K. Williams*, and *Gustavo Piganneau*, were the best blooms. It was a bright collection, the individual blooms being of moderate size. Messrs. G. & W. H. BORN, Peterborough, were 2nd, and Mr. CHAS. TURNER, Slough, 3rd.

Mr. B. R. CANT, was 1st for twenty-four Roses, distinct, three trusses of each, the general quality of the blooms being rather below than above the usual standard. *Maurice Bernardin*, *Ulrich Brunner*, *Marie Baumann*, and *Camille Bernardin*, were the best. *Madame Cusin* was in exquisite colour, but the blooms were lacking form and had been slightly dashed. *Mrs. W. J. Grant*, by reason of its excellent colour, was conspicuous in this collection. It is, however, rather thin. Mr. FRANK CANT was 2nd; and Messrs. HARKNESS & SONS 3rd. There were other competitors.

The best collection of twelve trusses, distinct, of any Rose other than *Tea* or *Noisette*, was from Messrs. D. PRIOR & SONS, Colchester, who had *Horace Vernet*; Mr. B. R. CANT was 2nd, with *Mrs. Jno. Laing*; and Messrs. G. & W. H. BORN 3rd, with *Her Majesty*.

AMATEURS.

The most important of the classes devoted to amateurs was for twelve distinct single trusses, the 1st prize for which was a handsome Silver Cup, value ten guineas, presented by Messrs. Sutton & Sons. There were eighteen collections, and the coveted position was taken by the Rev. J. H. PEMBERTON, Davington-at-Bower, Essex. His blooms were decidedly good. They were:—*Her Majesty*, *A. K. Williams*, *Gustavo Piganneau*, *Ulrich Brunner*, *Horace Vernet*, *Comtesse de Nadailac*, *Chas. Lefebvre*, *Mrs. Jno. Laing* (beautifully fresh), *François Michelson*, *Comte Raim-*

band, Victor Hugo, and Jno. Stuart Mill; E. B. LINDSELL, Esq., Hitchin, who was 2nd, might well be proud of several of his own specimens; CHAS. J. GRAHAME, Esq., Leatherhead, was 3rd; and OSMOND G. ORPEN, West Bergholt, Colchester, 4th.

For twenty-four distinct single trusses, open to all amateurs, E. B. LINDSELL, Esq., was the most fortunate competitor. Mrs. Jno. Laing, Duke of Connaught, Camille Bernardin, Duc d'Orleans, Duke of Wellington, and Jean Ducher were the most praiseworthy specimens in a very satisfactory exhibit. The Rev. J. H. PEMBERTON was only an indifferent 2nd in this class, though a few of the blooms were very good. J. GURNEY FOWLER, Esq., Glebelands, South Woodford, was 3rd.

Eight competitors entered for the prizes for eighteen distinct single trusses (open only to growers of fewer than 2000 plants). P. G. C. BURNAND, Esq., Reigate, Surrey, was 1st. Alfred Colomb and a few others were good, but Marie Van Houtte and even Jean Ducher should not have been included. The Rev. H. A. BERNERS was 2nd, and E. M. BETHUNE, Esq., Horsham, Sussex, 3rd.

A class open to exhibitors in the two preceding classes, for six distinct Roses, three trusses of each, was won by the Rev. J. H. PEMBERTON; E. B. LINDSELL, Esq., was 2nd; and P. G. C. BURNAND, Esq., 3rd.

Growers of fewer than 1000 plants competed for the best twelve distinct blooms, and RIVERS H. LANGTON, Esq., Heaton, N.W., obtained 1st prize for a satisfactory collection, of which Madame Cusin deserved mention. MAHLOW WHITTLE, Esq., Belgrave Avenue, Leicester, could only have lost the 1st position by a few points. OSMOND G. ORPEN, Esq., was 3rd.

The best six single trusses, distinct from growers of fewer than 500 plants, were shown by Mr. GEO. MOYLES, Hitchin. His Prince Arthur was very good. W. D. FRESHFIELD, Esq., Reigate, was 2nd, and there were several other competitors.

Exhibitors in the two preceding classes again competed for the best four Roses, distinct, three trusses of each, when MAHLOW WHITTLE, Esq., 56, Belgrave Avenue, Leicester, was 1st.

An open class to all amateurs for six single blooms of any one variety other than Tea or Noisette, was won by C. J. GRAHAME, Esq., among nineteen collections. His variety was Mrs. John Laing; E. B. LINDSELL, Esq., was 2nd with Horace Vernet; and O. G. ORPEN, Esq., 3rd, with Kaiserin Augusta Victoria.

Another class open to all amateurs was for twelve bunches, distinct, of varieties H.P., H. T., or Teas or Noisettes. H. V. MACHIN, Esq., was 1st with a collection rather lacking in freshness; and Mr. JAS. PARKER, The Croft, Headington, Oxford, 2nd.

#### TEAS AND NOISETTES.

The best twenty-four distinct single trusses (nurserymen), were from Messrs. D. PRIOR & SONS, Colchester, who had an exhibit of general fine quality, Madame de Watteville, Ethel Brownlow, Madame Cusin, Jean Ducher, The Bride, Maman Cocher, Marie van Houtte, Innocente Pirola, and others were very good. Mr. FRANK CANT followed, and he had good specimens of Comtesse de Nadailac, The Bride, Ernest Metz, Souvenir d'Elise Vardon, Bridesmaid, and Marie van Houtte. Mr. B. R. CANT was 3rd. There were three other competitors. Mr. JNO. MATTOCK, New Headington, Oxford, was 1st for twelve blooms, and included fine specimens of Jean Ducher, Catherine Mermet, Miss E. Brownlow, and Ernest Metz. Messrs. JAS. TOWNSEND & SONS, Worcester, were 2nd, and J. BURRELL & Co., Cambridge, 3rd. There were eight collections.

The best eighteen distinct single trusses from amateurs were shown by OSMOND G. ORPEN, Esq., Madame Cusin, Françoise Kruger, Madame Hoste, Catherine Mermet, Honourable Edith Gifford were the best blooms in a moderately good exhibit. The 2nd prize was taken by the Rev. H. A. BERNERS, and the 3rd by the Rev. A. FOSTER MELLIER.

Of growers of fewer than 500 plants who exhibited nine distinct Teas in single trusses, the best was CONWAY JONES, Esq., Euclescote, Gloucester, and he had very fine blooms of Madame Cusin, Princess of Wales, and Madame de Watteville. The 2nd and 3rd prizes went to RIVERS H. LANGTON, Esq., and Mr. JAS. PARKER, The Croft, Headington, Oxford. There were seven collections.

Growers of fewer than 200 plants competed for the best six Teas, distinct, and the successful competitor was MAHLOW WHITTLE, Esq., 56, Belgrave Avenue, Leicester; followed by R. FOLEY HOBBS, Esq., 4, Forge Street, Worcester.

CONWAY JONES, Esq., won a class open to all amateurs for six distinct Teas, three of each. Another open class for six single trusses of any Tea or Noisette was won by O. G. ORPEN, Esq., with Madame Hoste. There were upwards of a dozen collections, and R. H. LANGTON was 2nd.

Another open class for twelve trebles (Tea) was won by Messrs. D. PRIOR & SONS, Colchester, with a capital lot, perhaps a little deficient in coloured varieties; 2nd, Mr. FRANK CANT; 3rd, Mr. B. R. CANT.

An open class for twelve single trusses of any Teas or Noisettes was won by Messrs. D. PRIOR & SONS, Colchester, who showed Madame Van Houtte in very fine form indeed. Of the other nine competitors, Mr. JNO. MATTOCK led, with the same variety; Messrs. HARKNESS & SONS, Bedale, being 3rd.

Garden Roses were capital. For thirty six bunches, distinct, not fewer than three trusses to a bunch, Messrs. COOLING & SOYS, Bath, with a magnificent collection, won premier position; there was not a variety but was well

shown, and it is seldom that such an exhibit of garden Roses is made. Messrs. PAUL & SON, Cheshunt, who were 2nd, also showed well; Mr. FRANK CANT was 3rd; and Mr. CHAS. TURNER 4th.

The amateurs' class for eighteen bunches was won by A. TATE, Esq., Downside, Leatherhead; H. V. MACHIN, Esq., was 2nd, and O. G. ORPEN, Esq., 3rd.

The best exhibit of a display of Roses was upon a half-cone-shaped stage, and was of a tasteful nature; Mr. GEO. PRINCE, Oxford, was the exhibitor. Mr. JNO. MATTOCK was 2nd.

#### MEDAL ROSES.

The best hybrid perpetual exhibited by a nurseryman was A. K. WILLIAMS from Messrs. HARKNESS & SONS. The best H. P. from an amateur was Kaiserin Augusta Victoria from O. G. ORPEN, Esq., contained in his 4th prize stand in Messrs. SUTTON'S Cup Class. The same exhibitor won the Silver Medal for the best Tea (amateur) with a bloom of Madame Hoste shown in a treble. Mr. B. R. CANT had the best Tea (nurseryman), in a large bloom of Maman Cochet.

#### LOCAL CLASSES.

The pressure upon our space this week prevents us from giving particulars of the local classes at Reading, with the following exceptions. Mr. J. J. FLETCHER won the Silver-gilt Medal awarded as 1st prize for eighteen Roses, and had also the best H.P. in these classes, in a bloom of Lady Mary Fitzwilliam.

For twelve Roses, Mr. E. SUCH, Maidenhead, was 1st; and Mr. T. TUNTON, Maiden Erleigh, 2nd. Mr. FLETCHER was 1st also for a dozen Tea Roses.

In the smaller classes, for residents within 3 miles of Reading Town Hall, the principal prize-winners were Mr. J. W. HOUNSLOW, Mr. F. W. LONERGAN, Mrs. A. ASHBY, and Mr. R. C. MOUNT. Mr. Chamberlain, gr. to M. LONERGAN, Esq., had the best group of miscellaneous plants arranged for effect.

#### RICHMOND.

JUNE 24.—In spite of morning showers, the later day proved to be singularly beautiful, and the show-ground was thronged with visitors.

#### GROUPS.

The chief feature of the show was, as usual, found in the large plant-tent, and here groups or collections of plants of an honorary kind proved to be most effective. Of these the premier place may well be given to the fine group of Begonias elegantly arranged by Mr. H. J. JONES, of Lewisham, whose decorative effort, it is hoped, will be largely copied.

Messrs. J. VEITCH & SONS, Chelsea, had a big bunk of dwarf pot Roses, backed by *Hyliranga paniculata*; also one of their elegant Japanese Acers.

Messrs. HUGH LOW & Co., Clapton, sent a superb lot of Orchids—Cattleyas being in great force, and one of the most beautiful groups of dwarf *Cannas* we have yet seen. Messrs. PEED & SONS, Norwood, had a charming group of *Caladiums*, thinly placed amidst Maidenhair Fern. Messrs. W. CURTISH & SONS, Highbury, sent a big collection of *Souvenir de la Malmaison*, Germania, and other Carnations in pots. Mr. W. ICKTON, Putney, had a huge group of Palms and foliage plants. Mr. W. THOMPSON, Richmond, had Palms, *Hydrangeas*, &c. Messrs. B. S. WILLIAMS & SONS, Holloway, a fine group of miscellaneous plants.

Messrs. JAS. CARTER & Co. Holborn, a remarkably attractive collection of *Petunias* in pots, *Violas* in pans, and bunches of hardy flowers; and Mr. R. JENSEN, of Chingford, had a group of his zonal *Pelargonium* King of Denmark. Then from private gardens came very fine groups of mixed plants, sent by Mr. Wythes, gr. to Earl Percy, Syon House, Brentford; and by Mr. McLEOD, Dover House, Roehampton. To all these groups medals of various money values were awarded.

*Decorative Groups*.—In the open class for these Mr. G. FORDHAM, Trickingham, was 1st, with a most beautiful arrangement, light and graceful. *Gloxinias* and *Orchids* were ably utilised. Mr. McLEOD was 2nd, and Mr. VAUSE, of Leamington, who arranged a group in a small way, *a la Shrewsbury*, was 3rd.

*Specimen Plants*.—The best six specimens in flower came from Mr. A. OFFER, Crawley, all of moderate size, including two fair *Erics*, *Clorodendron Balfourianum*, *Durwina*, *Lulifera*, &c. Mr. VAUSE was 2nd. Mr. Potter, gr. to J. H. MASTERS, Esq., Petersham, had the best specimen in *Bougainvillea glabra*. Mr. OFFER had the best four foliage plants in *Heliconia aurea striata*, *Croton Queen Victoria*, *Cycas revoluta*, and *Kentia australis*. Mr. W. Farr, gr. to A. PEARA, Esq., Isleworth, being 2nd; and Mr. VAUSE 3rd.

Mr. C. WAT, gr. to Sir F. WIGAN, Sheen, had the best specimen in a noble *Cycas revoluta*; Mr. OFFER coming next, with a good specimen of *Croton angustifolius*.

*Caladiums* finely coloured came from Mr. ALLSOP, gr. to W. CONNARD, Esq., Trickingham, 1st; and Mr. McLEOD 2nd.

*Show and Fancy Pelargoniums* were well shown as usual by Mr. C. TREZNER, Slough, who had the best six plants of each, the best of the former being Gold-mine, Joe, and Magenta; and of the fancies, Ambassador, The Shah, and delicatum. Mr. Wiggins, gr. to W. STACEY, Esq., West Drayton, was 2nd in the show class.

Mr. TURNER had the best group of show varieties in small pots, Mr. WIGGINS being 2nd.

*Orchids*.—Mr. W. H. Young, Orchid grower to Sir F. WIGAN, was the only exhibitor in a class for six, having excellent *Cattleyas Mossie* and *Mendell*, *Phalenopsis San-*

*deriana*, *Odontoglossum crispum*, *Cypripedium vitellinum*, and *Miltonia vexillaria*.

*Gloxinias* were very good, the best nine in one class coming from Mr. FORDHAM, and in another class from Mr. Smith, gr. to W. ODRAM, Esq., Richmond, very fine plants. *Begonias*, *Fuchsias*, &c., were also staged.

*Roses*—These were in good form, though not so numerous as usual. The best forty-eight trebles came from Messrs. D. PRIOR & SONS, Colchester, whose flowers were first-rate. Amongst them were Prince Arthur, Victor Hugo, A. K. WILLIAMS, Prosper Langier, Charles Darwin, Horace Vernet, Fisher Holmes, Marie Hansmann, Ulrich Brunner, Marie Verdier, Mrs. J. Laing, Her Majesty, &c. Mr. F. CANT, also of Colchester, was 2nd.

With twenty-four trebles Messrs. PAION & SONS were again 1st. Messrs. G. & W. H. BURCH, Peterborough, being 2nd. These had in their boxes such beautiful Teas as Edith Gifford, Marie Van Houtte, Jean Ducher, and Catherine Mermet.

Messrs. PRIOR were again 1st with twelve trebles with twelve blooms of one H. P.

Messrs. PRIOR were well 1st with splendid Ulrich Brunner, Messrs. BURCH coming 2nd with Her Majesty, very good.

Messrs. PRIOR had the best Tea Rose in The Bride, Marie Van Houtte was 2nd, and Edith Gifford 3rd.

Mr. W. RUMSEY, of Waltham Cross, sent a collection of *Roses*; and boxes also came from Messrs. SPOONER & SONS, Hounslow, and WILL TAYLOR, Hampton.

Messrs. PERKINS & SONS had the best bouquet of beautiful *Orchids*: Mr. SEALE, of Sevenoaks, coming 2nd with one of *Roses*; the latter had the three best dinner-table epergnes. Some fine epergnes, &c., came from the Misses COLE, Feltham. The decorations of this nature were, as usual, very extensive.

*Hardy Flowers*.—Mr. G. Sage, gr. to the Earl of DYSART, Ham House, was the chief exhibitor of these in bunches, taking prizes in the class for twenty-four, twelve, and six, all excellent. From Messrs. BARR & SONS, Long Ditton, Messrs. J. JACKMAN & SONS, Woking, and Messrs. J. YETCH & SONS, also came fine collections, more or less effectively arranged.

#### FRUIT.

Mr. G. SAGE had the best collection of six dishes, with fair Black Hamburg and Foster's Seedling Grapes, grand Brown Turkey Figs, good Lord Napier Nectarines, Hero of Lockinge Melons, and Latest-of-All Strawberries; Mr. Tidy, gr. to W. R. D'ARCY, Esq., Stanford Hill, was 2nd; and Mr. OSMAN, Ottershaw, 3rd.

The best three bunches of black Grapes were remarkably fine; Madresfield Court, staged by Mr. Blake, gr. to the Earl of ONSLOW, Clendon Park, one not having produced thirteen bunches all as good. Mr. Ford, gr. to W. H. ELLIS, Esq., Hounslow, was 2nd; and Mr. OSMAN 3rd.

With white Grapes, Mr. TIDY was 1st, with good Duke of Buccleuch; Mr. OSMAN being 2nd; and Mr. TUNTON, Maiden Erleigh, 3rd.

The best Melon, Hero of Lockinge, came from Messrs. SARGENT, Worthing. Mr. FORD had, in *Gros-e Mignonne*, the best Peaches; Mr. ALLSOP, in Lord Napier, the best Nectarines; and Mr. SAGE, the best Figs.

Tomatoes were very handsome, a beautiful dish of Perfection coming from Mr. FORD; and Mr. SAGE had the best two sorts of Strawberries in Ginton Park and Latest of All.

#### VEGETABLES.

were in great force, as usual. In the Society's class for twelve kinds, Mr. C. J. WAITE, gr. to the Hon. Col. TALBOT, Esher, was 1st, with fine samples; and Mr. GIBSON, gr. to E. W. WATTS, Esq., Chiswick, was 2nd.

In Messrs. CARTER & Co.'s class for nine kinds, Mr. WILKINS, gr. to Lady T. GUEST, Henridge, was 1st, with capital samples; Mr. WAITE coming 2nd.

In Messrs. SUTTON & SONS' class, for six kinds, Mr. GIBSON was 1st, and Mr. WAITE 2nd.

There were many other classes that cannot be referred to now.

## Obituary.

**JAMES STEWART SADLER.**—There died at his residence, Pollokwood House, near Glasgow, on Sunday, 14th inst., Mr. James Stewart Sadler, sole surviving partner of the well-known firm of Smith & Simons, nurserymen and seedsmen of that city. Mr. Sadler was fifty-five years of age, and leaves a widow and an only son. The deceased was well known in the trade, and much respected; and his knowledge of every department of a nursery was extensive, with an experience wide and varied. His career began with Messrs. Dickson & Sons, of Edinburgh; he afterwards occupied a responsible and confidential position in the firm of Peter Lawson & Son, with much success, and nearly thirty years ago, he removed to Glasgow, to join his old friend, the late Mr. Charles Smith, in the management of the business, which has since then been carried on successfully; and in this connection it was Mr. Sadler's wish that it should continue to be carried on by his son and Mr. George Clark, who has been

manager and traveller in the services of the firm for some years, and arrangements were understood as being made for effecting that end. Mr. Sailer's only brother John, who died a few years ago, was, it will be remembered, Curator of the Royal Botanical Gardens, Edinburgh.

**GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—Under the presidency of the Lord Mayor of York, a meeting was held on the afternoon of the first day of the Show in the council tent, the object being to bring before the notice of gardeners the benefits of the Institution. Mr. J. S. GRAY moved—"That this meeting, having heard the objects of the Gardeners' Royal Benevolent Institution, and considering such an excellent institution well worthy of support, heartily commends it to the practical sympathy of all Yorkshire gardeners, and to the kind assistance of all employers and patrons of gardening." This motion was seconded by Mr. H. J. CLAYTON and carried unanimously.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE, RAINFALL, and BRIGHT SUN. It includes a detailed table for accumulated temperature with sub-columns for day-degrees and differences, and a table for rainfall and bright sun.

The districts indicated by number in the first column are the following:— 0, Scotland, N. Principal Wheat-producing Districts— 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Graining, &c., Districts— 6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; \*Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending June 20, is furnished from the Meteorological Office:—

The weather during this period varied a good deal in different parts of the kingdom. At first it was fine and very warm in all districts, but by the middle of the week it had become rainy and cooler very generally, with thunderstorms in several parts of Great Britain. These unsettled rainy conditions continued over the greater part of Ireland and Scotland; but over England the weather towards the close of the period again became fine and dry.

The temperature continued above the mean, the excess ranging from 3° or 4° in Ireland and Scotland, to 5° or 6° over England. The highest of the maxima were registered either on the 13th or 16th, when the thermometer rose to 87° in 'England, S.W.,' to between 84° and 86° in the other English districts, to between 82° and 84° in Ireland, and to between

78° and 81° over Scotland. In the 'Channel Islands' the highest reading was 77°. The lowest of the minima were recorded during the latter part of the period, and ranged from 30° in 'England, S.W.,' and 41° in Scotland, W., to 49° in 'England, N.W.,' and to 54° in the 'Channel Islands.'

The rainfall was considerably more than the mean over Ireland and Scotland, and just equal to the normal in 'England, N.W. and S.W.,' in all other districts, however, there was a deficit.

The bright sunshine exceeded the mean in all districts excepting 'Scotland, N.' The percentage of the possible duration ranged from 64 in the 'Channel Islands,' and from between 51 and 59 over England, to 41 in 'Ireland, N.,' and to 32° in 'Scotland N.,"

SEEDS.

LONDON: June 24.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., state that to-day's seed market presented quite a holiday appearance, with almost a complete absence of business. Just now there are scarcely any sowing requirements to be filled, whilst no speculation of any importance shows itself. New samples of Trefoil and Trifolium may shortly be expected. Clover seeds keep exceedingly firm. There is no alteration in either Mustard or Rape seed. Offers of new Turkish Canary seed for delivery in the autumn now come forward less freely from the other side. Peas and Haricots are without change. The Linseed market is dull.

FRUIT AND VEGETABLES.

BOROUGH: June 23.—Quotations:—Cabbages, 1s. 6d. to 3s. per tally; Spinach, 2s. per bushel; Cauliflowers, 1s. 6d. to 2s. per dozen; Onions, English, 6s. to 7s. per tally; foreign do., 3s. 6d. to 4s. per cwt.; Radishes, 2s. 9d. to 3s. per tally; new Carrots, 2s. 6d. to 3s.; Turnips, 1s. 9d. to 2s. 6d.; Parsley, 1s.; Mint, 6d. per dozen bunches; Beetroot, 1s. 6d. to 2s. per bushel; Rorseradish, 1s. 6d. per roll; Rhubarb, 1s. 6d. per doz. bundles; Endive, 1s. 6d. per dozen; Cucumbers, English, 2s. 6d. to 3s. 9d.; do., Dutch, 1s. 6d. to 2s. 6d. per dozen; Peas, English, 2s. to 3s. per sack, and 1s. 6d. to 2s. 6d. per bushel; French Beans, 3d. per flat; Lettuces, 2d. to 6d. a score; Strawberries, 2s. 6d. to 3s. per peck; Cherries, English, 5s. to 8s. per half-sieve; do., for ign, 1s. 9d. per basket; Gooseberries, 2s. to 3s. per half-sieve.

SPITALFIELDS: June 23.—Quotations:—Cabbages, 1s. 6d. to 2s. per tally; Mint, 2s. per dozen bunches; Parsley, 2s. to 3s. do.; Turnips, 1s. 6d. to 2s. 6d. do.; Carrots, 2s. to 3s. do.; Lettuce, 5d. to 9d. per score; Peas, 1s. 6d. 2s. per bushel; do., Blues, 3s. 6d. to 4s. 6d. per bag; do., Whites, 2s. to 3s. 6d. do.; Beans, Broad, 1s. to 1s. 6d. per bushel; Onions, old, 2s. to 2s. 6d. do.; Beetroot, 1s. 6d. to 2s. do.

STRAFORD: June 23.—Quotations:—Cabbages, 1s. to 3s. per tally; Beetroot, 4d. to 8d. per dozen; Horse radish, 2s. to 2s. 6d. per bundle; Parsley, 1s. to 1s. 6d. per dozen; Rhubarb, field, 1s. per dozen; Leeks, 1s. to 2s. per dozen; Spring Onions, 2s. to 4s. per dozen; Salad, 1s. 6d. to 2s. per punnet; Cherries, 5s. to 6s. per bushel; Strawberries, 1s. 3d. to 2s. 9d. per peck; Gooseberries, 2s. to 3s. per half-sieve; do., 3s. to 4s. per flat; Tomatos, Guernsey, 4d. to 5d. per lb.; ditto, English, 5d. to 7d. per lb.; frame Cucumbers, 1s. to 3s. 6d. per dozen; Asparagus, 6d. to 1s. per 100 heads; Green Peas, 1s. 3d. to 2s. 9d. per sieve; do., 3s. to 4s. per bag; Carrots, 1s. to 3s. per dozen bunches; Mangolds, 16s. to 18s. per ton; Onions, Egyptian, 8s. to 9s. per ton.

FABRINGTON: June 25.—Quotations:—Cabbage, 3s. per tally; Cauliflowers, 2s. 6d. per half-tally; Peas, 5s. per bag; Carrots, 4s. per dozen bunches; Turnips, 4s. do.; Onions, spring, 2s. per dozen bunches; do., 4s. per cwt.; Gooseberries, 3s. per half-bushel; Cherries, black, 5s. do.; white, 6s. do.; do.; Strawberries, 1s. 6d. per peck; selected do., 1s. 6d. per gallon; Tomatos, English, 6s. per dozen pounds; Raspberries, 6s. per dozen punnets; good Pine-apples, 3s. each; Cucumbers, 2s. per dozen.

POTATOS.

BOROUGH: June 23.—Quotations: Old ranged from 40s. to 70s. per ton; New, from 6s. 6d. to 9s. per cwt. PITAFIELDS: June 23.—Quotations:—Old; High-kinds, 35s. to 50s.; Black-kinds, 20s. to 35s. per t.m. New: Jerseys, £8 to £8 10s.; Myatt's, £7 10s. to £8; Rounds, £7 to £8; Lisbon, £5 10s. to £6 per ton.

STRAFORD: June 23.—Quotations:—Old; light-soil Bruces, 15s. to 40s.; Magnum, 15s. to 20s. per ton. New: Jersey Kidneys, 7s. to 8s.; do. Flukes, 7s. 6d. to 9s.; Chierbourg, 6s. 6d. to 7s. 6d.; St. Malo Flukes, 6s. 6d. to 7s. 6d.; Lisbon, 5s. to 5s. 6d.; Canary, 4s. to 6s. 6d. per cwt.

FABRINGTON: June 25.—Quotations:—Old Potatos done here; new range from 7s. 6d. Kidney, to 8s. 6d. Flukes, per cwt.

LONDON MARKET AVERAGES: June 24.—New: Jersey, 7s. to 8s.; Snowdrops, light, 7s. 6d. to 8s. 6d.; Hebrons, 7s. to 8s.; St. Malo, 6s. to 7s.; Chierbourg, 6s. to 7s. per cwt. Old: Dumber Bruce and Main Crop, 40s. to 60s. per ton.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.) for the week ending June 23, and for the corresponding period last year:—1896: Wheat, 25s. 17.; Barley, 22s. 8.; Oats, 15s. 1d. 1895: Wheat, 26s. 5d.; Barley, 15s. 5d.; and Oats, 16s. 1d.

HAY.

Averages.—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, prime, 65s. to 90s.; inferior, 38s. to 60s.; Hay, best, 60s. to 85s.; inferior, 30s. to 55s.; mixture, 60s. to 84s.; and straw, 20s. to 40s. per load.

MARKETS.

COVENT GARDEN, JUNE 25.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the supplies, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing prices for plants in pots such as Adiantum, Aspidistra, Calceolaria, Coleus, Dracana, Erica, Evergreen Shrubs, Ferns, Ficus, and Heliotrope, with prices in s. d. s. d.

Bedding Plants in variety.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing prices for cut flowers such as Arums, Bouvardias, Carnations, Eucharis, Forget-me-nots, Gardenias, Lilac, Liliun Harrisii, Liliun candidum, Maidenhair Fern, Marguerites, Mignonne, Paonies, and Orchids.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing prices for fruit such as Cherries, Apples, Currants, Figs, Grapes, Hamburgs, Muscats, Melons, Nectarines, Peaches, Pine-apples, Raspberries, and Strawberries.

VEGETABLES.—AVERAGE WHOLESALE PRICES.

Table listing prices for vegetables such as Beans, Broad, Cucumbers, Marrows, Mushrooms, Peas, Tomatos, and Turnips.

NEW POTATOS.

Prices easier, with moderate supplies; Jerseys, 7s. to 8s.; English Marble, 8s. to 11s.; Hebrons and Parisians, 7s. to 8s. per cwt. J. B. Thomas.

## VARIORUM.

## THE FLOWER TRADE OF THE ITALIAN RIVIERA.

—THE British Vice-Consuls at San Remo and Bordighera in their latest Reports refer to the growth of the trade in flowers from the Italian Riviera. Mr. Congreve, writing from San Remo, says that the only trade largely increasing in his district is that in flowers. Along the coast line from that place to Ospedaletti and Bordighera Olive trees have been ruthlessly cut down, the ground has been rearranged in high terraces, and all planted with Roses and Carnations, the picturesqueness of the scenery being greatly spoiled by this wholesale destruction of the characteristic Olives. Mr. Daly reports that Bordighera, as a resort for visitors, is, perhaps, more essentially British than any other place on the Riviera. Particularly all the ground used for residential purposes by foreigners is owned by British subjects, also a considerable portion not yet built upon. Although the prices asked for building sites are high (ranging from five to twenty lire the square metre), such sites are constantly passing into the hands of British owners who have either an immediate or future intention of building. Bordighera has no special industries. Olives, Palms, and Lemons are cultivated for profit, but of late years there has been a tendency to substitute the culture of Roses and other flowers with a view to exportation. The Olive crop is precarious, a really good yield seldom occurring more frequently than once in three years, and often more rarely still. Lemons, which a dozen years ago commanded a remunerative price, have now nearly ceased to do so. Palms are still exported in greater numbers than from any other place on the coast, but the trade is in a few hands. But the growth of Roses and other flowers for exportation has expanded into a considerable trade within the last few years, with the result that clearings have been made in the dense belt of Olives which fringe the coast line between Ventimiglia and Bordighera. Even this new industry, however, has, he observes, shown signs of exhaustion, affected by the weather, the caprice of the markets, and other causes. Still, the new flower trade, when the conditions affecting it are properly understood, will, he believes expand, and to some extent become a source of local wealth. The exportation of flowers is not largely in the hands of the actual growers; a small class of middleman has been created, the members of which contract in the autumn for the winter and spring produce of the gardens. *Leicester Daily Post.*

ADDRESS: T. H. S. J. Sumner, Limited, Leyland, Lancashire.

APPLES: *J. T. Putney.*—The fruits are out of character and cannot be named with certainty. Send them in their proper season.

BOOKS: *C. B. W. & Co.* *Mushrooms for the Million*, by J. Wright, 171, Fleet Street, E.C.

CHRYSANTHEMUM: *J. R. P. & Sons.* There is no organic disease, and no trace of fungi. The spots on the leaves represent cells which are practically dead, and contain only brown gummy matter, but without trace of mould or mycelium. *M. C. C.*

CUCUMBERS: *C. W. H.* The roots sent are quite healthy, and the soil very suitable for Cucumber growing. The fruits appear to be attacked by a Cladosporium, the life-history of which is in need of investigation. The Bordeaux Mixture, although a good means of killing many minute species of fungi, is powerless against this one.

FAIRY RINGS ON LAWS: *C. L. W.* Some substance must be used to kill the "spawn" of the Mushroom which is always spreading outwards from the circumference, the crop of the fungus having exhausted the supply of nitrogen found in the soil it was raised on. Strong brine used hot or cold should do this, but probably more than one

application would be necessary. Removing the soil to the depth of 1 foot over rather more than the area occupied by the rings is another method of prevention.

FIG TREE WITH A GROSS SHOOT FOUR FEET LONG, &c.: *Inexperienced.* It was wrong practice to allow such large development to this centrally-placed shoot; the point should have been nipped out when the shoot was 1½ foot long. The shoot would then have made lateral shoots, and helped materially to furnish the tree. You might be able to bend it down horizontally, and thus do good to the other shoots by diverting the sap from it to them. At the winter pruning, this strong shoot ought to have two-thirds of its length removed. The shoots of the young Fig trees must be so pruned in the winter as to cause an increase of the number of radial members commensurately with the gradual increase of the circumference of the crown. Not much fruit can be looked for while this building-up of the tree is in progress. In the third or fourth year an appreciable number of fruits will form, and a light crop may then be taken; or if a tree is very vigorous, and shows many fruits, no harm will be done by taking a moderately large first crop and a smaller second one. When the ground-work of the tree is laid, fruiting laterals, which must be stopped at 9 inches in length, may be laid in between the chief branches, but there should be no crowding of these, and all weak spruce should be constantly removed entirely.

FRUIT FOR WEST AFRICA: *W. C.* The fruit sent should be nearly ripe in the case of Pears and Peaches; Nectarines and Grapes not quite ripe. Wrap in tissue-paper, separating the fruit and bunches of Grapes with the finest wood-shavings, and pack fairly firmly. Place in the cold room of the steamer, but not where they will freeze. Boxes with air-holes or slits are better than baskets.

GRAPES SPOTTED: *Anxious.* The berries show signs of the much-dreaded "spot," for which at present no cure is known.

INSECTS: *W. Cooper.*—The beetles destructive to Roses are *Phyllopartha horticola*, nearly allied to the cockchafer. Hand-picking is probably the only remedy for the perfect insect. The larvæ destroy roots of grasses, &c., in the same way as the cockchafer, and the remedies for the latter would apply equally well here, such as lime, gas-water, &c. Of still more importance is the encouragement of birds, especially starlings. The larvæ are said to exist three years before assuming the perfect state. *R. McL.*

MEALY-BUG ON VINES: *J. M. R.* To rid Vines of mealy-bug is always difficult, and attempts to do so in the summer season have only a very partial effect. You might try the effect of vaporising the vine with Richards' XL All, doing it several times at intervals of two or three days. It will not injure the Vines or fruit, and the latter will not acquire an odour from the substance that will be perceptible after the lapse of a few days. Touching the bugs with a camel's-hair pencil dipped in methylated spirits will kill them. Radical measures should be adopted in the winter season to get rid of the pest.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*W. D.* 1, *Pinus Balfouriana*; 3, *Abies firma*; 4, *Tsuga Pattoniana*; 5, *Abies amabilis*; 6, *Juniper*, next week.—*J. C. & Co.* *Pæony* variety.—*L. M. S.* *Argemone mexicana.*—*Flora.* We find only one, and that is *Valeriana officinalis.*—*A. E. D.* *Fraxinus Ornus.*—*W. H. R.* *Chamaerops Fortunei*; it is not unusual to see this flower in the South of England. Potatoes similar to the one you send are not uncommon, and have often been figured in our columns. Probably they are the result of some injury in the first instance.

—*G. D.* 1, *Saxifraga Gemm.*, perhaps; 2, *Sedum glaucum*; 3, *Saxifraga umbrosa*, perhaps; 4, *Sedum album*; 5, *Sedum spurium.*—*H. K.* *Farleigh Gesnera Leopoldi.*—*F. F.* 1, *Gaillardia picta*; 2, *Funkia Sieboldii*; 3, *Schizophragma hydrangeoides*, often called *Hydrangea scandens*; 4, *Chrysanthemum maximum*; 5, *Achillea Ptarmica*, *flor pleno*; 6, *Ribes alpinum aureum.*—*Specimens in green Moss, No Name.* 1, *Asphodelus ramosus*; 2, *Hieracium murorum*, probably; 3, *Allium Moly*; 4, *Saxifraga* species; 5, *Festuca ovina glauca.*—*E. C. H.* It is impossible for us to name florists' Carnations; send to some grower.—*S.* *Broom Hill.* A very pretty variety of *Cattleya labiata Mendeli Tempus fugit.* 1, *Aechusa italica*; 2, *Agrostemma*

*coronaria*; 3, *Ocimum pulvinatum*; 4, *Lycnis dioica, flore pleno*; 5, *Genista tinctoria.*—*W. R. F.* *Geranium pratense.*—*B. S.* One of the varieties of *Aërides multiflorum.*—*N. C.* 1, *Tradescantia virginica*; 2, *Tanacetum vulgare*; 3, *Hieracium Pilosella*; 4, 5, next week; 6, *Geranium Robertianum.*—*W. T.* *Colutea arborescens.*—*W. S. T.* *Gleditsia triacanthos, Double Sweet Briar*; No. 3 was not found.—*Canborne.* *Orobancha minor*, a parasite peculiar to the roots of herbs or shrubs. It differs from the *Lathraea* in that the sepals are not divided into four toothed segments.—*R. R.* 1, *Rhodotypos Kerrioides*; 2, *Griselinia littoralis*; 3, Not recognised, no flowers; 4, *Schinus Molle*, perhaps; 5, *Cupressus Lawsoniana* var.; 6, *Rubus odoratus*; 7, *Alonsoa incisifolia.*—*H. R.* 1, *Zenobia (Andromeda) speciosa*; 2, *Spiraea chamaedrifolia*; 3, *Spiraea callosa.*

PEAR LEAVES: *Sarony.* The work of the Pear-sawfly. As the other methods have failed, try strong tobacco-water.

PINK: *H. A. D.* A very nice fragrant border variety, resembling, in the colour of its bloom, the variety Ernest Ladams, and worth perpetuating as a variety suitable for dry poor soils.

PROLIFEROUS TOMATOS: *D.* The production of adventitious fruits outside the mother-fruit was not uncommon in old days when ribbed fruits were common; now that the smooth varieties have all but ousted the others, this condition is more rarely seen. It is due to over-growth of the axis of the fruit and to the production of supernumerary fruits. How to check that superfluous growth must be a matter of practical management.

SEEDLING STRAWBERRIES: *J. H., Abingdon.* The fruits arrived in a damaged condition, owing to the heat, &c.; moreover, the heavy rains had spoiled the flavour. Send again if you can.

TENANCY WITHOUT AGREEMENT: *J. Maers.* We cannot advise, and should counsel you to consult a solicitor.

TOMATO: *E. G., A. H. C., and Others.* Your fruits are affected with the fungus so often described. Spraying with weak Bordeaux Mixture early in the season would have prevented much of it.

VEGETABLES PRESERVED: *W. J. P.* There are two principal methods, viz., by desiccation and pressure, and by cooking in air-tight bottles or tins, by placing them in a bath in which muriate of lime is dissolved. This substance is used because a temperature of 270° to 280° Fahr. can be maintained without material evaporation taking place. The tins have soldered lids provided with one or two small holes, which are closed by solder as soon as the heat begins to decline; or if bottles are used, then the patent steel self-fitting capsules and bottles or jars of the French Flint-glass Bottle Co., figured and described in these columns at p. 565, May 2, this year, are the best for this kind of preserving. French Beans, Peas, also the curd of Cauliflowers, can be kept in brine. Button Mushrooms can be kept in the same manner, or in vinegar and salt. Cucumbers in brine and sauerkraut for those who like these things. There is no single method short of drying which answers for every kind of vegetable.

COMMUNICATIONS RECEIVED.—*W. E. G.*—*H. H. D'O.*—*F. B.*—*C. H. P.*—*D. R. W.*—*E. D. T.*, shortly.—*T. B.*—*W. T. T.*—*D.*—*W. G. S.*—*F. F.*—*D. S.*—*W. C.*—*W. E. G.*—*S. O. G.*—*E. F.*—*D. ## CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of more than 90 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES of GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

# THE GARDENERS' CHRONICLE

(THE TIMES OF HORTICULTURE)

A Weekly Illustrated Journal

(ESTABLISHED 1841)

Among the Correspondents & Contributors to recent Volumes the following, out of many Hundreds, may be named:—

**ALPINE PLANTS:—**

HALL, J., F.R.S., the late.  
CHURCHILL, G. C., Clifton, Bristol.  
CORREYON, H., Geneva.  
DEWAR, B., Glasgow.  
DOD, Rev. C. W., Malpas.  
JENKINS, E., Hampton.  
POTTER, R., York.

**AMATEUR GARDENING:—**

BADGER, E. W.  
BOYLE, Hon. Mrs., "E. V. B." ("Days and Hours in a Garden")  
BRIGHT, the late H. A. ("Notes from a Lancashire Garden")  
CLARKE, Col. Trevor.  
CORDEROY, Justin.  
ELLACOMBE, Rev. Canon.  
EWBANK, Rev. H., Ryde.  
FREMANT-MITFORD, A. B.  
GUMBLETON, W. E., Belgrove, Cark.  
SALTER, J., F.R.S.  
THOMSON, W., Teignmouth.  
WEIR, Harrison.  
WILSON, G., F.R.S., Weybridge.  
WILKS, Rev. W., Shirley.

**ARBORETUM, &c.:—**

ANNESLEY, the Earl of.  
ACLAND, Sir T., Bart.  
ACTON, T., Kilmacurragh.  
BAKER, W. R., Bayfordbury.  
CROUCHER, G., Ochtertyre, Crieff.  
DUCIE, the Earl of.  
MACLEAY, the late Sir G.  
MEATH, the Earl of.  
NICHOLSON, G., Curator, Royal Gardens, Kew.  
POWERSCOURT, Viscount.  
RASHLEIGH, J., Menabily.  
SARGENT, Prof., Arnold Arboretum, Cambridge, U.S.A.  
SHANNON, the Earl of, the late.  
SMITH, T. A., Darrien, Esq.  
STAIR, the Earl of.  
TREVELYAN, Sir W., Bart., the late.  
VAN VOLXEM, J., the late, Brussels.

**CHEMISTRY:—**

CHURCH, Prof., F.R.S.  
DEHERAIN, Prof., Paris.  
DYER, Bernard.  
GILBERT, Sir J. H., F.R.S., Rothamsted.  
LAWES, Sir J. B., Rothamsted.  
MILNOR, W. S.  
MULLER, Dr. Hugo, F.R.S.  
WARINGTON, R., F.R.S.  
WILLIS, J. J., Rothamsted.

**DISEASES OF PLANTS:—**

ARTHUR, Prof., New York.  
ROS, Dr. Ritzeema, Wageningen.  
COOKE, Dr. M. C.  
KLEBAHN, Dr., Bremen.  
MAGNUS, Prof., Berlin.  
MASSEE, G., Kew.  
MURRAY, G., British Museum.  
PAGET, Sir James, F.R.S.  
PHILLIPS, W.  
PLOWRIGHT, Dr. C. B., King's Lynn.  
PRILLIEUX, Prof., Paris.  
SMITH, W. G.  
SORAUER, Prof., Proskau.  
WARD, Prof. Marshall.

**FERNS:—**

BAKER, J. G., Royal Gardens, Kew.  
BRUBERY, C. T., Forest Gate.  
HEMSLEY, A.  
JENMAN, British Guiana.  
LOWE, E. J., Chesham.

**FLORISTS' FLOWERS, &c.:—**

DEAN, R., Ealing.  
DODWELL, E. S., Oxford, the late.  
D'OMBRAIN, Rev. H. H., Westwell.  
DOUGLAS, J., Iford.  
RNGLEHEART, Rev. G.  
HORNBER, Rev. F. D.  
LLEWELYN, Sir J. D., Bart.  
MOIYNEUX, E., Swanmore Gardens.  
PAUL, G., Paisley.  
TURNER, C., the late.

**FOREIGN CORRESPONDENCE:—**

ADLAM, R. W., Johannesburg.  
ALBIOFF, Dr., Odessa.  
ANDERSEN, Prof., Sweden.  
ANDRE, E., Paris.  
BARRON, L., New York.  
BENNET, H., the late, M.D., Mentona.  
BUDDE, J. K., Utrecht.

**FOREIGN CORRESPONDENCE:—**

CARRIERE, E., Paris.  
CARUEL, Prof., Florence.  
CORCORAN, Odessa.  
COSTERUS, Br., Amsterdam.  
CLOS, Prof., Toulouse. [Brussels.  
CREPIN, Director, Botanic Garden,  
BAMMER, Dr. Udo, Berlin.  
DE BOSSCHERE, C., Antwerp, Belgium.

 A Customer writes:—"Dear Sirs,—I am pleased to say  
 that the 24-inch works as well as ever it did. As you  
 know, it was bought in 1874—that's a long time for a  
 machine. I am open to back it now against any machine  
 in the county, long or short, wet or dry, against any other  
 machine of different makers."
